

Administering Avaya Aura[®] System Manager for Release 8.1.x

Release 8.1.x
Issue 10
March 2021

Notice

While reasonable efforts have been made to ensure that the information in this document is complete and accurate at the time of printing, Avaya assumes no liability for any errors. Avaya reserves the right to make changes and corrections to the information in this document without the obligation to notify any person or organization of such changes.

Documentation disclaimer

"Documentation" means information published in varying mediums which may include product information, operating instructions and performance specifications that are generally made available to users of products. Documentation does not include marketing materials. Avaya shall not be responsible for any modifications, additions, or deletions to the original published version of Documentation unless such modifications, additions, or deletions were performed by or on the express behalf of Avaya. End User agrees to indemnify and hold harmless Avaya, Avaya's agents, servants and employees against all claims, lawsuits, demands and judgments arising out of, or in connection with, subsequent modifications, additions or deletions to this documentation, to the extent made by End User.

Link disclaimer

Avaya is not responsible for the contents or reliability of any linked websites referenced within this site or Documentation provided by Avaya. Avaya is not responsible for the accuracy of any information, statement or content provided on these sites and does not necessarily endorse the products, services, or information described or offered within them. Avaya does not guarantee that these links will work all the time and has no control over the availability of the linked pages.

Warranty

Avaya provides a limited warranty on Avaya hardware and software. Refer to your sales agreement to establish the terms of the limited warranty. In addition, Avaya's standard warranty language, as well as information regarding support for this product while under warranty is available to Avaya customers and other parties through the Avaya Support website: <https://support.avaya.com/helpcenter/getGenericDetails?detailId=C20091120112456651010> under the link "Warranty & Product Lifecycle" or such successor site as designated by Avaya. Please note that if You acquired the product(s) from an authorized Avaya Channel Partner outside of the United States and Canada, the warranty is provided to You by said Avaya Channel Partner and not by Avaya.

"Hosted Service" means an Avaya hosted service subscription that You acquire from either Avaya or an authorized Avaya Channel Partner (as applicable) and which is described further in Hosted SAS or other service description documentation regarding the applicable hosted service. If You purchase a Hosted Service subscription, the foregoing limited warranty may not apply but You may be entitled to support services in connection with the Hosted Service as described further in your service description documents for the applicable Hosted Service. Contact Avaya or Avaya Channel Partner (as applicable) for more information.

Hosted Service

THE FOLLOWING APPLIES ONLY IF YOU PURCHASE AN AVAYA HOSTED SERVICE SUBSCRIPTION FROM AVAYA OR AN AVAYA CHANNEL PARTNER (AS APPLICABLE), THE TERMS OF USE FOR HOSTED SERVICES ARE AVAILABLE ON THE AVAYA WEBSITE, <https://support.avaya.com/LicenseInfo> UNDER THE LINK "Avaya Terms of Use for Hosted Services" OR SUCH SUCCESSOR SITE AS DESIGNATED BY AVAYA, AND ARE APPLICABLE TO ANYONE WHO ACCESSES OR USES THE HOSTED SERVICE. BY ACCESSING OR USING THE HOSTED SERVICE, OR AUTHORIZING OTHERS TO DO SO, YOU, ON BEHALF OF YOURSELF AND THE ENTITY FOR WHOM YOU ARE DOING SO (HEREINAFTER REFERRED TO INTERCHANGEABLY AS "YOU" AND "END USER"), AGREE TO THE TERMS OF USE. IF YOU ARE ACCEPTING THE TERMS OF USE ON BEHALF A COMPANY OR OTHER LEGAL ENTITY, YOU REPRESENT THAT YOU HAVE THE AUTHORITY TO BIND SUCH ENTITY TO THESE TERMS OF USE. IF YOU DO NOT HAVE SUCH AUTHORITY, OR IF

YOU DO NOT WISH TO ACCEPT THESE TERMS OF USE, YOU MUST NOT ACCESS OR USE THE HOSTED SERVICE OR AUTHORIZE ANYONE TO ACCESS OR USE THE HOSTED SERVICE.

Licenses

THE SOFTWARE LICENSE TERMS AVAILABLE ON THE AVAYA WEBSITE, <https://support.avaya.com/LicenseInfo>, UNDER THE LINK "AVAYA SOFTWARE LICENSE TERMS (Avaya Products)" OR SUCH SUCCESSOR SITE AS DESIGNATED BY AVAYA, ARE APPLICABLE TO ANYONE WHO DOWNLOADS, USES AND/OR INSTALLS AVAYA SOFTWARE, PURCHASED FROM AVAYA INC., ANY AVAYA AFFILIATE, OR AN AVAYA CHANNEL PARTNER (AS APPLICABLE) UNDER A COMMERCIAL AGREEMENT WITH AVAYA OR AN AVAYA CHANNEL PARTNER. UNLESS OTHERWISE AGREED TO BY AVAYA IN WRITING, AVAYA DOES NOT EXTEND THIS LICENSE IF THE SOFTWARE WAS OBTAINED FROM ANYONE OTHER THAN AVAYA, AN AVAYA AFFILIATE OR AN AVAYA CHANNEL PARTNER; AVAYA RESERVES THE RIGHT TO TAKE LEGAL ACTION AGAINST YOU AND ANYONE ELSE USING OR SELLING THE SOFTWARE WITHOUT A LICENSE. BY INSTALLING, DOWNLOADING OR USING THE SOFTWARE, OR AUTHORIZING OTHERS TO DO SO, YOU, ON BEHALF OF YOURSELF AND THE ENTITY FOR WHOM YOU ARE INSTALLING, DOWNLOADING OR USING THE SOFTWARE (HEREINAFTER REFERRED TO INTERCHANGEABLY AS "YOU" AND "END USER"), AGREE TO THESE TERMS AND CONDITIONS AND CREATE A BINDING CONTRACT BETWEEN YOU AND AVAYA INC. OR THE APPLICABLE AVAYA AFFILIATE ("AVAYA").

Avaya grants You a license within the scope of the license types described below, with the exception of Heritage Nortel Software, for which the scope of the license is detailed below. Where the order documentation does not expressly identify a license type, the applicable license will be a Designated System License as set forth below in the Designated System(s) License (DS) section as applicable. The applicable number of licenses and units of capacity for which the license is granted will be one (1), unless a different number of licenses or units of capacity is specified in the documentation or other materials available to You. "Software" means computer programs in object code, provided by Avaya or an Avaya Channel Partner, whether as stand-alone products, pre-installed on hardware products, and any upgrades, updates, patches, bug fixes, or modified versions thereto. "Designated Processor" means a single stand-alone computing device. "Server" means a set of Designated Processors that hosts (physically or virtually) a software application to be accessed by multiple users. "Instance" means a single copy of the Software executing at a particular time: (i) on one physical machine; or (ii) on one deployed software virtual machine ("VM") or similar deployment.

License types

Designated System(s) License (DS). End User may install and use each copy or an Instance of the Software only: 1) on a number of Designated Processors up to the number indicated in the order; or 2) up to the number of Instances of the Software as indicated in the order, Documentation, or as authorized by Avaya in writing. Avaya may require the Designated Processor(s) to be identified in the order by type, serial number, feature key, Instance, location or other specific designation, or to be provided by End User to Avaya through electronic means established by Avaya specifically for this purpose.

Heritage Nortel Software

"Heritage Nortel Software" means the software that was acquired by Avaya as part of its purchase of the Nortel Enterprise Solutions Business in December 2009. The Heritage Nortel Software is the software contained within the list of Heritage Nortel Products located at <https://support.avaya.com/LicenseInfo> under the link "Heritage Nortel Products" or such successor site as designated by Avaya. For Heritage Nortel Software, Avaya grants Customer a license to use Heritage Nortel Software provided hereunder solely to the extent of the authorized activation or authorized usage level, solely for the purpose specified in the Documentation, and solely as embedded in, for execution on, or for communication with Avaya equipment. Charges for Heritage Nortel Software may be based on extent of activation or use authorized as specified in an order or invoice.

Copyright

Except where expressly stated otherwise, no use should be made of materials on this site, the Documentation, Software, Hosted Service, or hardware provided by Avaya. All content on this site, the documentation, Hosted Service, and the product provided by Avaya including the selection, arrangement and design of the content is owned either by Avaya or its licensors and is protected by copyright and other intellectual property laws including the sui generis rights relating to the protection of databases. You may not modify, copy, reproduce, republish, upload, post, transmit or distribute in any way any content, in whole or in part, including any code and software unless expressly authorized by Avaya. Unauthorized reproduction, transmission, dissemination, storage, and or use without the express written consent of Avaya can be a criminal, as well as a civil offense under the applicable law.

Virtualization

The following applies if the product is deployed on a virtual machine. Each product has its own ordering code and license types. Unless otherwise stated, each Instance of a product must be separately licensed and ordered. For example, if the end user customer or Avaya Channel Partner would like to install two Instances of the same type of products, then two products of that type must be ordered.

Third Party Components

"Third Party Components" mean certain software programs or portions thereof included in the Software or Hosted Service may contain software (including open source software) distributed under third party agreements ("Third Party Components"), which contain terms regarding the rights to use certain portions of the Software ("Third Party Terms"). As required, information regarding distributed Linux OS source code (for those products that have distributed Linux OS source code) and identifying the copyright holders of the Third Party Components and the Third Party Terms that apply is available in the products, Documentation or on Avaya's website at: <https://support.avaya.com/Copyright> or such successor site as designated by Avaya. The open source software license terms provided as Third Party Terms are consistent with the license rights granted in these Software License Terms, and may contain additional rights benefiting You, such as modification and distribution of the open source software. The Third Party Terms shall take precedence over these Software License Terms, solely with respect to the applicable Third Party Components to the extent that these Software License Terms impose greater restrictions on You than the applicable Third Party Terms.

The following applies only if the H.264 (AVC) codec is distributed with the product. THIS PRODUCT IS LICENSED UNDER THE AVC PATENT PORTFOLIO LICENSE FOR THE PERSONAL USE OF A CONSUMER OR OTHER USES IN WHICH IT DOES NOT RECEIVE REMUNERATION TO (i) ENCODE VIDEO IN COMPLIANCE WITH THE AVC STANDARD ("AVC VIDEO") AND/OR (ii) DECODE AVC VIDEO THAT WAS ENCODED BY A CONSUMER ENGAGED IN A PERSONAL ACTIVITY AND/OR WAS OBTAINED FROM A VIDEO PROVIDER LICENSED TO PROVIDE AVC VIDEO. NO LICENSE IS GRANTED OR SHALL BE IMPLIED FOR ANY OTHER USE. ADDITIONAL INFORMATION MAY BE OBTAINED FROM MPEG LA, L.L.C. SEE [HTTP://WWW.MPEGLA.COM](http://www.mpegla.com).

Service Provider

THE FOLLOWING APPLIES TO AVAYA CHANNEL PARTNER'S HOSTING OF AVAYA PRODUCTS OR SERVICES. THE PRODUCT OR HOSTED SERVICE MAY USE THIRD PARTY COMPONENTS SUBJECT TO THIRD PARTY TERMS AND REQUIRE A SERVICE PROVIDER TO BE INDEPENDENTLY LICENSED DIRECTLY FROM THE THIRD PARTY SUPPLIER. AN AVAYA CHANNEL PARTNER'S HOSTING OF AVAYA PRODUCTS MUST BE AUTHORIZED IN WRITING BY AVAYA AND IF THOSE HOSTED PRODUCTS USE OR EMBED CERTAIN THIRD PARTY SOFTWARE, INCLUDING BUT NOT LIMITED TO MICROSOFT SOFTWARE OR CODECS, THE AVAYA CHANNEL PARTNER IS REQUIRED TO INDEPENDENTLY OBTAIN ANY APPLICABLE LICENSE AGREEMENTS, AT THE AVAYA CHANNEL PARTNER'S EXPENSE, DIRECTLY FROM THE APPLICABLE THIRD PARTY SUPPLIER.

WITH RESPECT TO CODECS, IF THE AVAYA CHANNEL PARTNER IS HOSTING ANY PRODUCTS THAT USE OR EMBED THE H.264 CODEC OR H.265 CODEC, THE AVAYA CHANNEL

PARTNER ACKNOWLEDGES AND AGREES THE AVAYA CHANNEL PARTNER IS RESPONSIBLE FOR ANY AND ALL RELATED FEES AND/OR ROYALTIES. THE H.264 (AVC) CODEC IS LICENSED UNDER THE AVC PATENT PORTFOLIO LICENSE FOR THE PERSONAL USE OF A CONSUMER OR OTHER USES IN WHICH IT DOES NOT RECEIVE REMUNERATION TO: (I) ENCODE VIDEO IN COMPLIANCE WITH THE AVC STANDARD ("AVC VIDEO") AND/OR (II) DECODE AVC VIDEO THAT WAS ENCODED BY A CONSUMER ENGAGED IN A PERSONAL ACTIVITY AND/OR WAS OBTAINED FROM A VIDEO PROVIDER LICENSED TO PROVIDE AVC VIDEO. NO LICENSE IS GRANTED OR SHALL BE IMPLIED FOR ANY OTHER USE. ADDITIONAL INFORMATION FOR H.264 (AVC) AND H.265 (HEVC) CODECS MAY BE OBTAINED FROM MPEG LA, L.L.C. SEE [HTTP://WWW.MPEGLA.COM](http://www.mpegla.com).

Compliance with Laws

You acknowledge and agree that it is Your responsibility for complying with any applicable laws and regulations, including, but not limited to laws and regulations related to call recording, data privacy, intellectual property, trade secret, fraud, and music performance rights, in the country or territory where the Avaya product is used.

Preventing Toll Fraud

"Toll Fraud" is the unauthorized use of your telecommunications system by an unauthorized party (for example, a person who is not a corporate employee, agent, subcontractor, or is not working on your company's behalf). Be aware that there can be a risk of Toll Fraud associated with your system and that, if Toll Fraud occurs, it can result in substantial additional charges for your telecommunications services.

Avaya Toll Fraud intervention

If You suspect that You are being victimized by Toll Fraud and You need technical assistance or support, call Technical Service Center Toll Fraud Intervention Hotline at +1-800-643-2353 for the United States and Canada. For additional support telephone numbers, see the Avaya Support website: <https://support.avaya.com> or such successor site as designated by Avaya.

Security Vulnerabilities

Information about Avaya's security support policies can be found in the Security Policies and Support section of <https://support.avaya.com/security>.

Suspected Avaya product security vulnerabilities are handled per the Avaya Product Security Support Flow (<https://support.avaya.com/css/P8/documents/100161515>).

Downloading Documentation

For the most current versions of Documentation, see the Avaya Support website: <https://support.avaya.com>, or such successor site as designated by Avaya.

Contact Avaya Support

See the Avaya Support website: <https://support.avaya.com> for product or Hosted Service notices and articles, or to report a problem with your Avaya product or Hosted Service. For a list of support telephone numbers and contact addresses, go to the Avaya Support website: <https://support.avaya.com> (or such successor site as designated by Avaya), scroll to the bottom of the page, and select Contact Avaya Support.

Trademarks

The trademarks, logos and service marks ("Marks") displayed in this site, the Documentation, Hosted Service(s), and product(s) provided by Avaya are the registered or unregistered Marks of Avaya, its affiliates, its licensors, its suppliers, or other third parties. Users are not permitted to use such Marks without prior written consent from Avaya or such third party which may own the Mark. Nothing contained in this site, the Documentation, Hosted Service(s) and product(s) should be construed as granting, by implication, estoppel, or otherwise, any license or right in and to the Marks without the express written permission of Avaya or the applicable third party.

Avaya is a registered trademark of Avaya Inc.

All non-Avaya trademarks are the property of their respective owners.
Linux® is the registered trademark of Linus Torvalds in the U.S. and other countries.

Contents

Chapter 1: Introduction	28
Purpose	28
Change history	28
Chapter 2: Overview	36
System Manager overview	36
New in this release	38
New in System Manager Release 8.1.3.1	38
New in System Manager Release 8.1.3	39
New in System Manager Release 8.1.2	41
New in System Manager Release 8.1.1	41
New in System Manager Release 8.1	42
Log on to System Manager	45
Turning off the compatibility mode	45
System Manager web console	46
System Manager Dashboard field descriptions	48
Logging on to the System Manager web console	49
Change Password field descriptions	53
Logon information for users with administrator privilege	53
Certificate based authentication	54
Tenant Management web console	57
Password and security policies for all administrators	59
Password aging policy enforcement	59
Password strength policy enforcement	60
Password history policy enforcement	60
Password lockout policy enforcement	60
Editing password policies	60
Password policies field descriptions	61
Managing System Manager password through CLI	64
Inactive session termination policy	71
Editing Session Properties	71
Session Properties field descriptions	71
Inactive Account Deactivation Policy field descriptions	72
Security settings	72
Login warning banner	72
Editing the login warning banner	73
Security Settings field descriptions	73
Customized interface	74
Adding the corporate logo	74
Customized Interface field descriptions	74
Reimporting the SSO cookie domain value	75

Administrative users.....	75
Viewing administrative user details.....	75
Adding an administrative user.....	76
Editing administrative user details.....	76
Editing administrative user roles.....	76
Enabling an administrative user.....	77
Disabling an administrative user.....	77
Deleting an administrative user.....	77
Terminating administrative user sessions.....	78
Administrative Users field descriptions.....	78
Add New Administrative User field descriptions.....	78
Chapter 3: Directory synchronization.....	80
Directory synchronization overview.....	80
Results of synchronization from the LDAP directory server to System Manager.....	81
Results of synchronization from System Manager to the LDAP directory server.....	81
Limitations in the synchronization of the LDAP directory server.....	82
Adding the synchronization datasource.....	82
Editing the synchronization datasource.....	84
Deleting a synchronization datasource.....	85
User synchronization datasource field descriptions.....	85
Preferred languages.....	90
Creating the user synchronization job.....	91
Scheduling a user synchronization job.....	92
Deleting a user synchronization job.....	93
User active synchronization job field descriptions.....	93
Synchronization job history.....	93
Synchronization job history field descriptions.....	94
Viewing Job Summary.....	94
Viewing Job Summary field descriptions.....	95
Chapter 4: Geographic Redundancy.....	96
Geographic Redundancy overview.....	96
Licensing in Geographic Redundancy.....	97
Geographic Redundancy terminology.....	98
Geographic Redundancy replication.....	100
Prerequisites for the Geographic Redundancy setup.....	100
Hardware resource and parameter for the Geographic Redundancy setup.....	101
Key tasks for Geographic Redundancy.....	103
Prerequisites before configuring Geographic Redundancy.....	105
Geographic Redundancy prerequisites overview.....	105
Copying the CRL URL.....	106
Configuring CRL download on the secondary System Manager server.....	107
Adding the trusted certificate of primary server to the secondary System Manager server...	108
Configuring Geographic Redundancy.....	109

Enabling the Geographic Redundancy replication.....	111
Disabling the Geographic Redundancy replication.....	112
Activating the secondary System Manager server.....	113
Deactivating the secondary System Manager server.....	114
Restoring the primary System Manager server.....	115
Reconfiguring Geographic Redundancy.....	117
Converting the primary System Manager server to the standalone server.....	119
About the Health Monitoring service.....	119
Configuring the timeout interval for health monitoring.....	120
Geographic Redundancy field descriptions.....	120
GR Health field descriptions.....	122
Prerequisites for configuring disaster recovery.....	124
Disaster recovery prerequisites.....	124
Configuring CRL download on the primary System Manager server.....	124
Adding the trusted certificate of secondary server to the primary System Manager server...	125
Replacing System Manager servers.....	126
Replacement of System Manager servers.....	126
Moving the existing primary System Manager server to a different location.....	126
Restoring the primary System Manager server using the old primary server backup data...	127
Restoring the primary System Manager server using the data on the secondary System Manager server.....	128
Replacing the secondary System Manager server on the site.....	128
Recovering the primary System Manager server from disaster.....	129
Configuring the GR-unaware elements to work with System Manager.....	131
Geographic Redundancy-unaware elements overview.....	131
Elements Geographic Redundancy manageability status matrix.....	132
Configuring various elements to change to the secondary System Manager.....	133
Introduction.....	133
Session Manager configuration.....	133
Communication Manager configuration.....	136
CS 1000 configuration.....	139
Meeting Exchange configuration.....	143
Presence Server configuration.....	143
Messaging configuration.....	144
Avaya Aura® Conferencing configuration.....	148
Avaya Meetings Server configuration.....	151
IP Office configuration.....	154
Visualization, Performance, and Fault Manager.....	157
Application Enablement Services.....	157
Avaya Aura® Contact Center.....	157
Avaya Multimedia Messaging configuration.....	158
Chapter 5: Managing groups and roles for resources.....	159
Managing groups.....	159

Group management.....	159
Viewing groups.....	160
Creating groups.....	160
Modifying groups.....	161
Creating duplicate groups.....	161
Deleting groups.....	162
Moving groups.....	162
Synchronizing resources for a resource type.....	163
Assigning resources to a group.....	163
Searching for resources.....	164
Searching for groups.....	165
Filtering groups.....	165
Filtering resources.....	166
Removing assigned resources from a group.....	167
Group Management field descriptions.....	167
New Group field descriptions.....	168
View Group field descriptions.....	170
Edit Group field descriptions.....	172
Delete Group Confirmation field descriptions.....	173
Duplicate Group field descriptions.....	174
Move Group field descriptions.....	174
Resource Synchronization field descriptions.....	175
Managing resources.....	175
Manage resources.....	175
Accessing resources.....	175
Assigning resources to a new group.....	176
Adding resources to a selected group.....	176
Searching for resources.....	177
Filtering resources.....	177
Resources field descriptions.....	178
Choose Group field descriptions.....	180
Choose Parent Group field descriptions.....	180
Managing roles.....	181
Role Based Access Control.....	181
Built-in roles.....	182
Custom roles.....	186
Viewing user roles.....	187
Adding a custom role.....	187
Adding a custom tenant administrator role.....	189
Assigning permissions to access Solution Deployment Manager.....	190
Mapping permissions by using the template.....	191
Assigning users to a role.....	192
Unassigning users from role	193

Copying permission mapping for a role.....	193
Editing a custom role.....	194
Deleting custom roles.....	194
Roles field descriptions.....	194
Add New Role field descriptions.....	195
Role Details field descriptions.....	196
Add Mapping field descriptions.....	196
Assigned Users field descriptions.....	197
Permission mapping field descriptions.....	197
Chapter 6: Granular role based access control.....	199
Granular RBAC.....	199
Implicit permissions required for Communication Manager objects.....	200
Sample scenario for the range feature.....	202
Assigning permissions in User Management.....	202
Assigning permissions through User Management.....	202
Field-level RBAC.....	204
Endpoints.....	208
Range in endpoints.....	208
Assigning range for endpoints.....	209
Assigning permissions for fields in endpoints.....	211
Hunt Group.....	213
Assigning range for hunt group.....	213
Assigning permissions for fields in hunt group.....	215
Trunk Group.....	217
Assigning permissions for fields in trunk group.....	217
Chapter 7: Managing users, public contacts, and shared addresses.....	219
Managing users.....	219
Users, public contacts, and shared addresses.....	219
Access to administrative users.....	220
End user self provisioning.....	221
Enabling self provisioning.....	221
Disabling self provisioning.....	221
Generating the communication profile password from the self provisioning interface.....	222
Changing the communication profile password from the self provisioning interface.....	223
Viewing details of a user.....	224
Creating a new user account.....	225
Creating a new user profile using the user provisioning rule.....	226
Results of using the user provisioning rule.....	227
Modifying user accounts.....	230
Creating duplicate users.....	231
Removing user accounts.....	232
Removing the deleted users from the database.....	232
Editing users in bulk.....	233

Viewing bulk user edit jobs.....	233
Deleting the bulk user edit job.....	234
Create new profile option.....	234
User Provisioning Rules and User Bulk Editor.....	235
User Bulk Editor field descriptions.....	235
Filtering users.....	247
User searchable fields.....	248
Searching for users by using Search component.....	249
Searching for users by using Advanced Search.....	249
Assigning roles to a user.....	249
Assigning roles to multiple users.....	250
Removing roles from a user.....	251
Assigning groups to a user.....	251
Assigning groups to multiple users.....	252
Removing a user from groups.....	252
Viewing deleted users.....	252
Restoring a deleted user.....	253
Assigning users to roles.....	253
Unassigning users from role	254
Managing addresses.....	254
Managing communication profiles.....	257
Managing default contact list of the user.....	274
Managing private contacts of a user.....	280
User Management field descriptions.....	292
User Profile Add field descriptions.....	295
User Profile Edit <User Name> field descriptions.....	315
User Profile View <User Name> field descriptions.....	333
User Profile Duplicate <User Name> field descriptions.....	348
User Delete Confirmation field descriptions.....	364
Assign Roles to Multiple Users field descriptions.....	364
Assign Roles field descriptions.....	365
Assign Groups field descriptions.....	366
Assign Groups to Multiple Users field descriptions.....	366
Deleted Users field descriptions.....	367
User Restore Confirmation field descriptions.....	368
Assign Users To Roles field descriptions.....	368
UnAssign Roles field descriptions.....	369
Managing bulk import and export.....	370
Managing public contacts.....	593
Manage public contact list.....	593
Adding a new public contact.....	593
Modifying details of a public contact.....	594
Deleting public contacts.....	594

Viewing the details of a public contact.....	594
Adding a postal address for a public contact.....	595
Modifying postal address of a public contact.....	595
Deleting the postal addresses of a public contact.....	596
Choosing a shared address for a public contact.....	596
Adding a contact address of a public contact.....	596
Modifying the details of a public contact.....	597
Deleting the contact address of a public contact.....	597
View Public Contact field descriptions.....	597
Edit Public Contact field descriptions.....	599
New Public Contact field descriptions.....	601
Public Contacts field descriptions.....	602
Managing shared addresses.....	604
Manage shared address.....	604
Assigning a shared address to the user.....	604
Adding a shared address.....	605
Modifying a shared address.....	605
Deleting a shared address.....	605
Add Address field descriptions.....	606
Edit Address field descriptions.....	606
Shared Address field descriptions.....	607
Managing presence access control lists.....	608
Manage Presence Access Control Lists.....	608
Presence ACL field descriptions.....	608
Communication profile password policy enforcement.....	609
Communication profile password policy.....	609
Editing the password policy for the communication profile	610
Communication Profile Password Policy field descriptions.....	611
Chapter 8: Managing user provisioning rules.....	613
User Provisioning Rule.....	613
Capabilities and guidelines of user provisioning rules.....	614
Adding User Provisioning Rules.....	615
Creating the user provisioning rule.....	616
Modifying the user provisioning rule.....	616
Viewing the user provisioning rule.....	617
Creating a duplicate user provisioning rule.....	617
Deleting a user provisioning rule.....	618
User Provisioning Rules field descriptions.....	618
New User Provisioning Rule field descriptions.....	619
Chapter 9: Managing elements.....	629
Importing users from Subscriber Manager to User Management.....	629
User data import to System Manager.....	629
Preparing the Subscriber Manager user data for import to User Management.....	630

Importing the Subscriber Manager user data to User Management.....	631
Subscriber Manager datasource parameters and attributes.....	633
Exporting the user data and creating the user profile.....	634
Importing users from CS 1000 Subscriber Manager to User Management.....	636
CS 1000 Subscriber Manager data import options.....	636
Preparing the CS 1000 Subscriber Manager user data for import to System Manager.....	636
Importing the CS 1000 Subscriber Manager user data to System Manager.....	637
Exporting the CS 1000 user data and creating the user profile.....	637
Preparing the CS 1000 Subscriber Manager user data for import to System Manager.....	637
Importing the CS 1000 UCM Subscriber Manager user data to System Manager.....	638
Exporting the CS 1000 user data and creating the user profile.....	639
Managing messaging.....	639
Messaging Class Of Service.....	639
Viewing Class Of Service.....	639
Class of Service List field descriptions.....	640
Messaging.....	640
Chapter 10: Managing Communication Manager.....	648
System Manager Communication Manager capabilities.....	648
Configuring Communication Manager user profile settings.....	649
Editing the Select All attribute in a table.....	650
Search component for Communication Manager objects.....	650
Managing Communication Manager objects.....	652
Communication Manager objects.....	652
Agents.....	658
Announcements.....	670
Audio Groups.....	682
Holiday Table.....	686
Vector Directory Number.....	688
Vector Routing Table.....	692
Service Hours Tables.....	695
Coverage Path.....	697
Coverage Time-of-day.....	706
Element Cut-Through.....	709
Endpoints.....	711
Hunt Group.....	779
Trunk Group.....	784
Managing Off PBX Configuration Set.....	786
Managing Off PBX Endpoint Mapping.....	789
Xmobile Configuration.....	791
Automatic Alternate Routing Digit Conversion.....	796
Automatic Route Selection Digit Conversion.....	798
Automatic Route Selection Toll.....	801
Cluster Session Manager.....	802

Data Modules.....	804
Class of service.....	814
Authorization Code.....	817
Class of Service Group.....	819
Uniform Dial Plan Groups.....	823
Uniform Dial Plan.....	827
Usage options.....	831
NRP Group.....	834
Chapter 11: Managing backup and restore.....	838
Backup and restore.....	838
/emdata/svars/ backup in System Manager.....	839
Backup failure due to lack of disk space in /swlibrary.....	839
Disk space management for System Manager backup.....	840
Backup and restore on System Manager that is configured for Geographic Redundancy.....	840
Accessing the Backup and Restore service.....	841
Viewing list of backup files.....	841
Enabling backup encryption.....	842
Creating a data backup on a local server.....	842
Creating a data backup on a remote server.....	843
Scheduling a data backup on a local server.....	844
Scheduling a data backup on a remote server.....	844
Editing a scheduled backup job.....	845
Deleting the scheduled backup job.....	846
Restoring data backup from a local server.....	847
Restoring a backup from a remote server.....	848
Restoring the backup through the command line interface.....	849
Disk space required for backup.....	850
Time duration for backup and restore.....	851
Supported ciphers, key exchange algorithms, and mac algorithms.....	851
Backup and Restore field descriptions.....	853
Backup field descriptions.....	853
Schedule Backup field descriptions.....	855
Restore field descriptions.....	856
Chapter 12: Configuring applications.....	859
Managing data retention rules.....	859
Data retention rules.....	859
Excluded log files.....	859
Accessing the Data Retention Rules service.....	861

Metering Collector configuration overview.....	1068
Metering Collector Configuration field descriptions.....	1068
Deleting the metering collector configuration.....	1069
Chapter 16: Data Replication Service.....	1070
Data Replication Service.....	1070
Synchronization in a Geographic Redundancy scenario.....	1071

DRS client audit.....	1071
Viewing replica groups.....	1072
Viewing replica nodes in a replica group.....	1072
Repairing a replica node.....	1073
Repairing all replica nodes in a replica group.....	1073
Viewing replication details for a replica node.....	1074
Removing a replica node.....	1074
Removing a replica node from the queue.....	1074
Replica Groups field descriptions.....	1075
Replica Nodes field descriptions.....	1076
Replication Node Details field descriptions.....	1079
Chapter 17: Managing reports.....	1082
Reports.....	1082
Support for generating endpoint reports with buttons.....	1082
Reports Generation field descriptions.....	1083
Generating a detailed report.....	1084
Generating a basic report.....	1085
New Report field descriptions.....	1085
Editing report parameters.....	1088
Rerunning reports.....	1088
Customizing reports.....	1089
Downloading reports.....	1090
Reports History field descriptions.....	1091
Configuring email properties.....	1091
Sending reports through email.....	1092
Deleting reports.....	1092
Configuring report properties.....	1092
Remote server configuration.....	1093
Adding a remote server.....	1093
Viewing the details of a remote server.....	1093
Editing the details of a remote server.....	1094
Deleting a remote server.....	1094
Add Server field descriptions.....	1094
Remote Server Configuration field descriptions.....	1095
Chapter 18: Managing scheduled jobs.....	1096
Scheduler.....	1096
Functions of the User Management scheduled job.....	1097
Accessing scheduler.....	1097
Assigning permissions to access Scheduler.....	1097
Viewing pending jobs.....	1098
Viewing completed jobs.....	1099
Viewing logs for a job.....	1099
Filtering jobs.....	1099

Editing a job.....	1100
Deleting a job.....	1100
Disabling a job.....	1101
Enabling a job.....	1102
Stopping a job.....	1102
Pending Jobs field descriptions.....	1103
Completed Jobs field descriptions.....	1105
Job Scheduling-View Job field descriptions.....	1106
Job Scheduling-Edit Job field descriptions.....	1108
Job Scheduling-On Demand Job field descriptions.....	1109
Disable Confirmation field descriptions.....	1110
Stop Confirmation field descriptions.....	1111
Delete Confirmation field descriptions.....	1112
Chapter 19: Templates.....	1114
Template management.....	1114
Template versioning.....	1114
Filtering templates.....	1114
Upgrading a template.....	1115
Adding CM Agent template.....	1116
Editing CM Agent template.....	1116
Viewing CM Agent template.....	1117
Deleting CM Agent template.....	1117
Duplicating CM Agent template.....	1117
Adding CM Endpoint templates.....	1118

Chapter 1: Introduction

Purpose

This document provides procedures for configuring Avaya Aura® System Manager and the Avaya Aura® applications and systems that System Manager manages.

The primary audience for this document is anyone who is involved with configuring, troubleshooting, maintaining and verifying System Manager at a customer site. The audience includes and is not limited to implementation engineers, field technicians, business partners, solution providers, and customers.

Change history

The following changes are made to this document since the last issue:

Issue	Date	Summary of changes
10	March 2021	Updated the following sections: • Generating the communication profile password from the self provisioning interface on page 222 • User Profile Add field descriptions on page 295 • Synchronize CM Data and Configure Options / Element Cut-Through field descriptions on page 709 • Configuration of IP Phone Group ID on SIP Devices on page 747

Table continues...

Issue	Date	Summary of changes
9	February 2021	For Release 8.1.3.1, added the section: New in System Manager Release 8.1.3.1 on page 38 For Release 8.1.3.1, updated the following sections: • System Manager web console on page 46 • System Manager Dashboard field descriptions on page 48 • System Manager message with login details on page 50 • System Manager alert messages at login on page 51 • Directory synchronization overview on page 80
8	November 2020	Updated the section: New in System Manager Release 8.1.3 on page 39

Table continues...

Issue	Date	Summary of changes
7	October 2020	For Release 8.1.3, added the following sections: • New in System Manager Release 8.1.3 on page 39 • System Manager message with login details on page 50 • setSecurityPolicy command on page 64 • Managing the password policies through CLI on page 65 • Changing the password policies through CLI on page 66 • Viewing the password policy status on page 68 • Displaying the password policies on page 69 • Restoring the default password policy settings on page 69 • Refreshing the default password policy settings on page 70 • Migration of J1xx endpoints configured as 96x1 SIP set type on page 725 • Criteria for migrating 96x1 SIP set type to J1xx set type on page 725 • Enabling the Discover Endpoint eligible for migration job on page 727 • Searching for 96x1 SIP set type for J1xx endpoint migration by using advanced search on page 727 • Migrating set type of selected J1xx endpoint from 96x1 SIP to J1xx set type on page 728 • Migrating set type of all J1xx endpoint from 96x1 SIP to J1xx set type on page 730 • Viewing endpoint migration job history on page 731 • Cancelling an endpoint migration job on page 732 • Deleting endpoint migration job on page 733 • Endpoint Migration field descriptions on page 733 • Endpoint Migration Job History field descriptions on page 734 • outboundConnectionLogging command on page 1170 • Enabling outbound connection logging on page 1170 • Disabling outbound connection logging on page 1171 • configureOutboundFirewall command on page 1171 • Configuring the outbound firewall rules on page 1173 • Viewing the list of outbound firewall rules on page 1174 • Viewing the outbound firewall rule status on page 1174 • Removing outbound firewall rules on page 1175 • Disabling the outbound firewall rule on page 1175

Table continues...

Issue	Date	Summary of changes
		• Overwriting the existing outbound firewall rules on page 1176 • Managing the outbound firewall rule logging on page 1177 • Manage Entity Classes on page 1200 • Adding an entity class on page 1200 • Editing an entity class on page 1201 • Deleting an entity class on page 1201 • Filtering entity classes on page 1201 • Manage Entity Classes field descriptions on page 1202 • Add Entity Class Update Entity Class field descriptions on page 1203 • manageEntityClassWhitelist command on page 1204 • Adding subject names for an entity class on page 1206 • Displaying subject names for an entity class on page 1207 • Viewing the subject name for an entity class on page 1207 • Viewing the subject name validation status for an entity class on page 1208 • Deleting the subject names for an entity class on page 1208 • Deletion of expired certificates from System Manager on page 1238 • Rebooting System Manager virtual machine from the web console on page 1274 • Viewing the shutdown history from the System Manager web console on page 1274 • Shutdown System Manager field descriptions on page 1275 For Release 8.1.3, updated the following sections: • Logging on to the System Manager web console on page 49 • System Manager alert messages at login on page 51 • Password strength policy enforcement on page 60 • Password history policy enforcement on page 60 • Password policies field descriptions on page 61 • User synchronization datasource field descriptions on page 85 • User Profile Add field descriptions on page 295 • Communication profile password policy on page 609 • Communication Profile Password Policy field descriptions on page 611 • View and Edit Profile SMGR field descriptions on page 874 • View Profile: TrustManagement field descriptions on page 890

Table continues...

Issue	Date	Summary of changes
		• Edit Profile: TrustManagement field descriptions on page 891 • View Profile: Communication System Management Configuration field descriptions on page 866 • Edit Profile: Communication System Management Configuration field descriptions on page 867 • Shutting down System Manager from the web console on page 1273 • Authentication Servers field descriptions on page 1243 • Create AVP Kickstart field descriptions on page 1329 • Generating and accepting the Appliance Virtualization Platform host certificates on page 1348 • New vCenter and Edit vCenter field descriptions on page 1381
6	April 2020	Added the following sections: • User searchable fields on page 248 • Searching for users by using Search component on page 249 • System Manager localization on page 1531 Updated the following sections: • System Manager web console on page 46 • Restoring the backup through the command line interface on page 849 • Upgrade Management overview on page 1392 • Installing language pack on System Manager on page 1532

Table continues...

Issue	Date	Summary of changes
5	March 2020	For Release 8.1.2, added the following sections: • New in System Manager Release 8.1.2 on page 41 • Excluded log files on page 859 • Applying data retention rule on page 861 • logRetention command on page 862 • updateLogRetention command on page 863 • pruneAllLogs command on page 863 • Remote key server alarms on page 991 • Data Encryption on page 1489 • Remote Key Server on page 1490 • Data Encryption password policy on page 1490 • encryptionPassphrase command on page 1491 • Adding encryption passphrase on page 1491 • Changing encryption passphrase on page 1491 • Removing encryption passphrase on page 1492 • Displaying encryption passphrase and slot assignment on page 1492 • encryptionRemoteKey command on page 1493 • Adding remote key server on page 1493 • Removing remote key server on page 1494 • Displaying remote key server and slot assignment on page 1494 • encryptionLocalKey command on page 1495 • Enabling local key store on page 1495 • Disabling local key store on page 1495 • Viewing data encryption status on page 1496 For Release 8.1.2, updated the following sections: • Agents field descriptions on page 663 • Enabling backup encryption on page 842 • Creating a data backup on a local server on page 842 • Creating a data backup on a remote server on page 843 • Restoring data backup from a local server on page 847 • Restoring a backup from a remote server on page 848 • Backup field descriptions on page 853

Table continues...

Issue	Date	Summary of changes
		• Restore field descriptions on page 856 • Data retention rules on page 859 • Data Retention field descriptions on page 862 • Edit Logger field descriptions on page 1020 • Edit Appender field descriptions on page 1021
4	October 2019	For Release 8.1.1, added the following sections: • New in System Manager Release 8.1.1 on page 41 • Holiday Table List on page 686 • Exporting all Holiday Table on page 686 • Exporting selected holiday table on page 687 • Importing holiday table on page 687 • Downloading Excel Template on page 688 • Service Hours Table List on page 695 • Exporting all Service Hours Table on page 696 • Exporting selected service hours table on page 696 • Importing service hours table on page 696 • Downloading Excel Template on page 697 • Configuration of IP Phone Group ID on SIP Devices on page 747 • Configuring the IP Phone Group ID for an endpoint on page 748 • Phone view layout of SIP Endpoints on page 757 • Endpoint display mode on page 759 • Support of common parameter across endpoint template on page 765 • VM Console overview on page 1361 • Opening a VM console from Solution Deployment Manager on page 1362 • VM Console field descriptions on page 1363 For Release 8.1.1, updated the following sections: • New User Provisioning Rule field descriptions on page 619 • IP Phone Group ID on page 747 • Button Assignment on page 756 • Broadcasting announcements on page 676

Table continues...

Issue	Date	Summary of changes
3	July 2019	Updated the following sections: • Geographic Redundancy prerequisites overview on page 105 • Disaster recovery prerequisites on page 124 • View and Edit Profile Messaging field descriptions on page 871 • Adding an Avaya Messaging profile for a user on page 929
2	June 2019	Added the Accessing the port matrix document on page 1534 section. Updated the Hardware resource and parameter for the Geographic Redundancy setup on page 101 section.
1	June 2019	Release 8.1 document.

Chapter 2: Overview

System Manager overview

System Manager is a central management system that delivers a set of shared management services and provides a common console for the Avaya Aura® applications and systems.

System Manager includes the following shared management services:

Service	Description
Solution Deployment Manager	To: • Deploy Avaya Aura® applications. • Upgrade and migrate Avaya Aura® applications.  Note: When an application is configured with Out of Band Management, Solution Deployment Manager does not support upgrade for that application. For information about upgrading the application, see the application-specific upgrade document on the Avaya Support website. • Download Avaya Aura® applications. • Install service packs, feature packs, and software patches for the following Avaya Aura® applications: - Communication Manager and associated devices, such as gateways, media modules, and TN boards. - Session Manager - Branch Session Manager - AVP Utilities - Avaya Aura® Appliance Virtualization Platform, the ESXi host that is running on the Avaya Aura® Virtualized Appliance. With the Solution Deployment Manager client, you can: • Deploy Avaya Aura® applications • Upgrade System Manager • Install software patches for System Manager

Table continues...

Service	Description
Users	Provides features to administer users, shared address, public contact list, and information of system presence access control list. You can: • Associate the user profiles with groups, roles, and communication profiles • Create a contact list • Add an address and private contacts for the user
User Provisioning Rules	To create user provisioning rules. When the administrator creates the user with the user provisioning rule, the system populates the user attributes from the rule. The administrator requires to provide minimal information.
Bulk import and export	To provide bulk import and export of user profiles and global settings.
Directory synchronization	To provide bidirectional synchronization of user attributes from System Manager to the LDAP directory server.
Elements	To provide features of individual components of System Manager. Some links provide access to generic features of System Manager. Most links provide access to features provided by System Manager components.
Events	To administer alarms and logs generated by System Manager and other components of System Manager. Serviceability agent sends alarms and logs to SAL Gateway and System Manager, which in turn forwards the alarms and logs to the Avaya Data Center. You can view and change the status of alarms. You can view logs and harvest logs for System Manager and the components, and manage loggers and appender.
Geographic Redundancy	To handle scenarios when the primary System Manager server fails or the data network fragments. In such a scenario, the system manages and administers elements such as Avaya Aura® Session Manager and Avaya Aura® Communication Manager across the customer enterprise using the secondary System Manager server.
Groups and Roles	To administer groups and roles. You can create and manage groups, roles, and permissions.
Licenses	To administer licenses for individual components of Avaya Aura® Unified Communication System.
Security	To: • Authenticate using certificates • Configure the certificate authority

Table continues...

Service	Description
System Manager data	To: • Back up and restore System Manager configuration data • Monitor and schedule jobs • Replicate data from remote nodes • Configure data retention settings and profiles for various services that System Manager provides
Tenant Management	To: • Create a tenant • Edit tenant details • Duplicate an existing tenant • Delete a tenant

New in this release

New in System Manager Release 8.1.3.1

Avaya Aura® System Manager Release 8.1.3.1 supports the following new feature and enhancements:

Support for Active Directory 2019

With Release 8.1.3.1, System Manager supports Active Directory 2019.

Removal of the System Manager message pop-up with last login details

From Release 8.1.3.1, System Manager does not display the message pop-up window at login.

The last login information is now displayed in the **Notifications** widget on the System Manager dashboard.

Enhancements to the System Manager Alert messages at login

From Release 8.1.3.1, System Manager does not display the Session Manager emergency Dial Pattern routes notification message for Emergency Location Management Solution in an Alert Message pop-up window.

The emergency Dial Pattern routes notification message is now displayed in the **Notifications** widget on the System Manager dashboard.

Enhancements to the Notifications widget

From Release 8.1.3.1, the **Notifications** widget on the System Manager dashboard also displays the user login information and emergency Dial Pattern routes notification message for Emergency Location Management Solution.

From System Manager Release 8.1.3.1 and later, you cannot close the **Notifications** widget.

New in System Manager Release 8.1.3

Avaya Aura® System Manager Release 8.1.3 supports the following new features and enhancements:

Migration of 96x1 endpoints to J-Series phone

With Release 8.1.3, System Manager supports the migration of 96x1 endpoints to the J-Series phone. For migration of endpoints, System Manager and Session Manager must be on Release 8.1.3 or later.

Service observe support for J-Series endpoints

With Release 8.1.3, Communication Manager and System Manager supports the **sip-sobsrv** button for the following J-Series endpoints: J169 and J179.

Support of apostrophe character for Login Name

With Release 8.1.3, the **Login Name** field on the **Users > User Management > Manage Users** page, supports login names with an apostrophe ('). This helps import a user that has a login name with an apostrophe.

Support of 256-character password length for LDAP Server credentials

With Release 8.1.3, System Manager supports a 256-character password. Configure the password in one of the following ways:

- On the **Users > Administrators > User Services > External Authentication** page in the **Password for Root Binding** field.
- On the **Users > Directory Synchronization > Sync Users > User Synchronization** page, in the **Synchronization Datasources** tab when performing a New or Edit operation. On the New/Edit User Synchronization Datasource page in the **Password** field.

Simple Certificate Enrollment Protocol enhancement to improve Certificate Management for endpoints

With System Manager Release 8.1.3 and later, supports the following:

- Endpoints that have certificates issued by System Manager can use entity classes to send certificate enrollment or renewal requests to System Manager. You can add, edit, and delete entity classes using the **Services > Security > Certificates > Manage Entity Classes** page. You can manage the password for entity classes on the View Profile: SMGR page in the Password Policy for Programmatic Accounts section.
- You can add, list, view, and delete subject names for the provided entity class using the **manageEntityClassWhitelist** command. You can add and delete bulk entries of subject names for an entity class. You can also check the status of the subject name validation for the entity class.
- You can use the **Number of days after which system deletes expired certificates** field on the **Services > Configurations > Settings > SMGR > Trust Management** page to set the number of days to delete the expired certificates from the system.

Support for outbound connection logging

With Release 8.1.3, you can log all outgoing connections from System Manager, using the `outboundConnectionLogging` utility.

Support for configuring the outbound firewall rule

With Release 8.1.3, you can configure System Manager outbound firewall rule by using the `configureOutboundFirewall` utility. You can add, list, view status, disable, remove, and overwrite the IP addresses and FQDN in the whitelist for establishing the outbound connection from System Manager.

Support of new CLI command for managing the password policies

With Release 8.1.3, System Manager supports the `setSecurityPolicy` command for managing password policies using the command line interface (CLI). This command is only applicable for changing or setting up the password for a CLI user or a root user that you create at the time of deployment.

Enhancement to password policies

With Release 8.1.3, the Communication Profile Password Policy and the Password strength policy are enhanced with the following:

- **Minimum total length** supports the default value of 14 characters as the minimum number of characters that you must use in a password.
- **Previous passwords blocked** supports the default value of 10 for the number of latest passwords that the system maintains in its history.
- Supports the addition of the new **Maximum repeated consecutive characters** field.
- Supports the addition of the new **Maximum consecutive characters from same character type** field.

Support for VMware ESXi 7.0

With Release 8.1.3, Avaya Aura® applications support the VMware® vSphere ESXi 7.0 and VMware® vCenter Server 7.0 in the VMware virtualized environment.

System Manager Welcome message

From System Manager Release 8.1.3, after your first successful login, when you log in to the System Manager web console or the System Manager command line interface again, System Manager displays the Welcome <SystemManager_UserName> pop-up window at your each subsequent login.

Enhancements to the System Manager alert messages at login

With Release 8.1.3, for the Emergency Location Management Solution, System Manager displays the Session Manager emergency Dial Pattern routes notification warning message in an Alert Messages pop-up window, if the Routing Locations, Routing Policies, and Dial Patterns are not configured on Session Manager according to the emergency calling guideline.

Centralized subscription licensing

With Release 8.1.3, WebLM supports the Centralized subscription licensing feature for solution licenses.

Enhancement to the number of IP Office branches support

With Release 8.1.3, System Manager supports up to:

- 2000 IP Office branches with System Manager Profile 3.
- 3500 IP Office branches with System Manager Profile 4.

New in System Manager Release 8.1.2

Avaya Aura® System Manager Release 8.1.2 supports the following new features and enhancements:

Data Encryption

With Release 8.1.2, you can enable or disable data encryption for Avaya Aura® applications at the time of deployment. Data Encryption is supported only for Appliance Virtualization Platform and VMware Virtualized environments. Once you deploy the application with data encryption, you cannot disable data encryption after deployment and vice-versa.

Support for encrypted backup and restore

With Release 8.1.2, you can create and restore encrypted backup after enabling backup encryption.

Support for log file retention period management

With Release 8.1.2, you can configure the automated purging rule for log files based on the retention period configured on the Data Retention page of System Manager web console. Default value for number of days to retain log files are 30 days.

Support for the Avaya Subscription license

With Release 8.1.2, WebLM supports the Avaya Subscription license. You can view the license usage of the Avaya Subscription license as **Metered**.

New in System Manager Release 8.1.1

Avaya Aura® System Manager Release 8.1.1 supports the following new features and enhancements:

VMware console for applications

With Release 8.1.1, you can open the VM console in a new browser window or on a new browser tab for the application that reside on Appliance Virtualization Platform Release 7.1.2 and later.

Based on the role of the user, you can assign the permissions for accessing the console.

Support for deploying Avaya SBCE using Solution Deployment Manager

With Release 8.1.1, you can:

- Download the Avaya Session Border Controller for Enterprise (Avaya SBCE) OVA from the Download Management page.

- Deploy the Avaya SBCE OVA.

To support this System Manager must be deployed on Profile 3 and higher systems.

Busy indicator support for J-Series endpoints

With Release 8.1.1, System Manager supports the **busy-ind** button for the following J-Series endpoints: J169, J169CC, J179, J179CC.

Support for the IP Phone Group Id field for SIP endpoints

With Release 8.1.1, System Manager supports the **IP Phone Group Id** field on the **Feature Options** tab for SIP endpoints.

On Communication Manager, this field is available on the page 3 of the **add station** or **change station** command. With Release 8.1.1, **IP Phone Group Id** also supports SIP endpoints.

Support for read only phone view layout for SIP Endpoints

With Release 8.1.1, you can view the Read only phone view layout for SIP Endpoints.

Support for common parameter across endpoint template

With Release 8.1.1, when you create a SIP endpoint, the system retains the common parameter information so that when you login SIP endpoints of that same type or of another type, all your SIP Endpoints are able to retrieve and update any of the common parameters they utilize.

The common parameters are on the **Elements > Communication Manager > Endpoints > Manage Endpoints** page on the **Profile Settings** and **Button Assignment** tabs.

Bulk import and export of Holiday Table and Service Hours Tables

Bulk import and export of **Holiday Table** and **Service Hours Tables** using System Manager web console. For adding, deleting and updating Holiday Table and Service Hours Tables in bulk, you can download a pre-loaded excel <Excel template file name>.xlsx file from **More Actions > Download Excel Template** on the following pages:

- **Elements > Communication Manager > Call Center > Holiday Table**
- **Elements > Communication Manager > Call Center > Service Hours Tables**

Multiple audio files upload in single click for broadcasting announcement

With Release 8.1.1, you can upload more than one audio files (.wav) in single click by using the **Browse** option of the **Select Announcement File** field.

New in System Manager Release 8.1

Avaya Aura® System Manager Release 8.1 supports the following new features and enhancements:

Support for System Manager Profile 4

With Release 8.1, System Manager supports a new Profile 4. The Profile 4 supports 35000 to 300000 users with up to 5000 Branch Session Manager instances and 28 Session Manager instances with a single System Manager system in an Avaya Aura® deployment.

System Manager Profile 1 not supported

From Release 8.0 and later, System Manager Profile 1 is not supported. If System Manager is on a pre Release 8.0 and using the Profile 1, ensure that the server has the required resources to configure Profile 2 on Release 8.0 and later.

Appliance Virtualization Platform Hypervisor

With Release 8.1, Appliance Virtualization Platform is based on the customized OEM version of VMware® ESXi 6.5.

Support for Red Hat Enterprise Linux operating system 7.6

With Release 8.1, you can deploy and upgrade Avaya Aura® applications on the Red Hat Enterprise Linux operating system 7.6.

Support of Windows Server 2016 for installing the Solution Deployment Manager client

With Release 8.1, you can install the Solution Deployment Manager client on the Windows Server 2016, 64-bit operating system.

Solution Deployment Manager enhancements

- Increased capacity for **Refresh, Analyze, Update/Upgrade** operations on multiple elements at the same time for System Manager:
 - Profile 2: 20 elements
 - Profile 3: 30 elements
 - Profile 4: 50 elements
- The `Bulk_Import_Spreadsheet_Template.xlsx` spreadsheet on the **Solution Deployment Manager > Upgrade Management > Download > Bulk Import Spreadsheet** page supports bulk upgrade of Branch Session Managers.
- During OVA deployment, the Network Parameters page is revamped to display wider UI elements to enhance user experience.

Appliance Virtualization Platform enhancements

On the **Solution Deployment Manager > Application Management > Platforms** tab, a new:

- **More Actions > AVP Firewall Rules** option is added to view Appliance Virtualization Platform firewall rules.
- **Advanced Configuration** tab is added on the **Change Network params > Change Network Settings > Host Network/IP Settings** page from where you can delete unused Port Groups that are not associated with any virtual machine.

Support for bulk upgrade of Branch Session Manager instances

With Release 8.1, you can perform bulk upgrade of Branch Session Manager instances by using the `Bulk_Import_Spreadsheet_Template.xlsx` spreadsheet on the **Solution Deployment Manager > Upgrade Management > Download > Bulk Import Spreadsheet** page.

Remote Syslog profile enhancement

With Release 8.1, the Add Syslog Receiver page provides the following TLS authentication options when the **tcp** protocol is selected.

- **Server certificate authentication**
- **Mutual TLS authentication**

Support for managing Syslog receiver certificates for Remote Syslog receiver

With Release 8.1, you can:

- Add trusted certificates for Remote Syslog receiver by selecting the **SYSLOG** store type on System Manager.
- Create identity certificate to use with Remote Syslog receiver by selecting the *syslog* service name on System Manager.

Administration and Serviceability enhancements

- Serviceability Agents management supports background execution job for pushing SNMP Target/User Profiles to multiple Serviceability Agents.
- Manage Elements displays a progress bar indication of background notification operations for Geographic Redundancy state change operations.
- API based management operations off-loaded from Port 443 to new Port 10443.
- Data Replication Service supports 250 node repairs at a time for System Manager Profile 4.
- Typeahead support is provided for the:
 - **Host Name** field on **Services > Events > Log Harvester > Create New Profile**.
 - **Survivability Server** field on **Users > User Provisioning Rule > Communication Profile > Session Manager Profile**.
- Advanced Search feature is added on the following pages:
 - **Inventory > Manage Elements**
 - **Inventory > Manage Serviceability Agents > Serviceability Agent**
 - **Replication > Replica Groups > Replica Nodes**
- Automated purging rule is added in Data Retention for Aged Scheduler Completed Jobs.
- Adding certificates for more than one element of same type and same version creates background job for execution. You can view this on the Certificate Management Jobs page using **Inventory > Manage Elements > More Actions > View Certificate Add Status** on System Manager.

Crisis Alert support for SIP endpoints

With Release 8.1, Crisis Alert (**crss-alert**) button support is added for SIP phones. When an emergency call is initiated by an enterprise user, then the crisis-alert watcher's endpoint displays an alert including information about emergency call.

No Hold Conference for SIP endpoints

With Release 8.1, No hold conference (**no-hld-cnfr**) button support is added for SIP phones. No Hold Conference is the ability to add a party in conference without putting existing users on Hold.

EC500 button support for SIP endpoints

With Release 8.1, System Manager supports the **EC500** button for the following endpoints: 9608SIPCC, 9611SIPCC, 9621SIPCC, 9641SIPCC, J169CC, J179CC, CS1K-IPCC (Avaya Device Adapter).

Call appearance and Bridged appearance with per button ring control for SIP endpoints

With Release 8.1, System Manager supports Call appearance (Abbreviated/Delayed ringing) and Bridged appearance with per button ring control for the following endpoints: 9608SIPCC, 9611SIPCC, 9621SIPCC, 9641SIPCC, J169CC, J179CC, CS1K-IPCC (Avaya Device Adapter).

Enhancements to the 16-digit extension

With Release 8.1, Avaya Aura® applications extend support for configuration of 16-digit extension to the following Communication Manager objects.

- hunt groups

 Note:

Administration of hunt group with 16-digit group extension and group members.

- coverage answer groups
- ELIN
- abbr dial buttons
- Listed Directory Number

Supported browsers

Following are the minimum supported versions of the supported browsers:

- Internet Explorer 11
- Mozilla Firefox 65, 66, and 67

IP Office integration with System Manager

From Release 8.1, you can add and administer the IP Office element from the System Manager web console.

Log on to System Manager

Turning off the compatibility mode

About this task

You might not be able to view the status of some operations on the webpages using Microsoft Internet Explorer because Internet Explorer imposes a time-out limit for the server to return the data. To correct this problem, you must install the patch for Internet Explorer from the Microsoft website at <http://support.microsoft.com/kb/181050%20>.

If the compatibility mode is turned on, some System Manager features might not work in Internet Explorer version 8 onwards. Therefore, you must turn off the compatibility mode.

Procedure

1. On the menu, click **Tools > Compatibility View Setting**.
2. In the Compatibility View Settings dialog box, clear all check boxes.
3. Ensure that the **Websites you've added to Compatibility View** field does not contain the address of the System Manager website.

System Manager web console

System Manager provides a centralized access to all Avaya Aura® elements through a browser-based Avaya management console with a Single Sign-on.

* Note:

- On a client, a single sign-on workflow must have the same domain name as System Manager. The domain name of the System Manager server must match that of the web client server. For instance, if the hostname of System Manager is `smgr.ca.avaya.com`, the server with the web client can have a hostname such as `client.ca.avaya.com` or `client.us.avaya.com`.
- System Manager allows you to open seven tabs simultaneously. The default number of tabs allowed to open is five. However, you can set the value to the maximum of seven on the System Manager Web Console. The pages that are opened in each tab should be from different Element Managers. If you open pages falling under the same Element Manager, you may encounter an error based on the operation you are performing. For example, editing the same station in two tabs may throw an error message.

The resolution of the System Manager web console is 1024×768. The System Manager web console provides the following:

- Corporate logo: You can add a logo on the web console.
- **Options** icon (

All the operational links are available under different menus, such as, **Users**, **Elements**, **Services**, **Widgets**, and **Shortcuts**.

By default, the System Manager dashboard displays the following widgets:

- **Alarms**
- **Application State**
- **Notifications**
- **System Resource Utilization**
- **Information**
- **Shortcuts**

*** Note:**

After login, if you remove one of the default widgets, then it is available under the **Widgets** menu.

From System Manager Release 8.1.3.1 and later, you cannot close the **Notifications** widget. If you closed the **Notifications** widget during the last login on the System Manager Release 8.1.3 and earlier, then after upgrading to System Manager Release 8.1.3.1 and later, the system displays the default dashboard layout.

System Manager Dashboard field descriptions

Name	Description
System Resource Utilization	The resource utilization of the System Manager system in percentage (%). Displays the data of the directories, such as opt, var, emdata, tmp, perfddata, swlibrary, home, and pgsq. The following are the system resource utilization status: •  Critical •  Warning •  Normal •  Free
Notifications	The current notification from the application. From Release 8.1.3.1, the Notifications widget on the System Manager dashboard also displays the user login information and emergency Dial Pattern routes notification message for Emergency Location Management Solution. The messages in the Notifications widget are short. To view the additional details for each message, you can hover on the message. From System Manager Release 8.1.3.1 and later, you cannot close the Notifications widget. If you closed the Notifications widget during the last login on the System Manager Release 8.1.3 and earlier, then after upgrading to System Manager Release 8.1.3.1 and later, the system displays the default dashboard layout.
Shortcuts	The shortcut of the menu options.

Table continues...

Name	Description
Alarms	The alarms data of the application. You can sort the alarms by Severity, Age, and Element Type. The following are the alarm status based on Severity: •  Critical : Displays the number of critical alarms for the system. •  Major : Displays the number of major alarms for the system. •  Indeterminate : Displays the number of uncategorized alarms. •  Minor : Displays the number of minor alarms for the system. •  Warning : Displays the number of warning alarms for the system. The following are the ranges for the alarm status based on Age: • 0 to 30 days • 30 to 60 days • 60 to 90 days • 90 to 120 days The system also displays the source IP Address and descriptions of the alarms.
Information	The status of the application, its synchronization status, and current usage. Current usage lists the number of users and simultaneous administrative logins.
Application State	The current status of the application and its major feature configuration, such as License Status, Deployment Type, Multi-Tenancy, OOBM State, and Hardening Mode.

Logging on to the System Manager web console

About this task

The System Manager web console is the main interface of Avaya Aura® System Manager. You must log on to the System Manager web console to perform any task. The System Manager home page displays the navigation menu that provides access to shared services to perform various

operations that System Manager supports. The tasks that you can perform from System Manager depend on your assigned role.

Before you begin

Deploy the System Manager OVA.

Procedure

1. On the web browser, type `https://<Fully Qualified Domain Name>/SMGR`, the System Manager URL.

In the security deployments, System Manager displays the Login Warning Banner page.

2. **(Optional)** On the Login Warning Banner page, click **Continue**.
3. In the **User ID** field, type the user name.
4. In the **Password** field, type the password.
5. Click **Log On**.

The system validates the user name and password with the System Manager user account.

- If the user name and password match, the system displays the System Manager home page with the System Manager `<version_number>`.
- If the user name and password do not match, System Manager displays an error message and prompts you to enter the user name and password again.

Once you log in, depending on the system and element configurations, System Manager can display one or more error or notification messages in an Alert Messages pop-up window. For information about these messages, see the “System Manager alert messages at logon” section.

6. Click **OK** to continue.

System Manager message with login details

Important:

From Release 8.1.3.1, System Manager displays the last login information in the **Notifications** widget on the dashboard.

In System Manager Release 8.1.3, after your first successful login, when you log in to the System Manager web console, System Manager displays the Welcome `<SystemManager_UserName>` pop-up window at your every subsequent login.

Note:

When you log in to the System Manager web console for the first time, System Manager does not display the Welcome `<SystemManager_UserName>` pop-up.

Depending on the last successful or unsuccessful login details, System Manager displays the messages in the Welcome `<SystemManager_UserName>` pop-up window.

For example:

```
You have successfully logged into System Manager
```

```
Your last successful login was at <Month> <Date>, <YYYY> <HH:MM> <AM/PM> from <Source_system_IPAddress>
```

```
Your last unsuccessful login was at <Month> <Date>, <YYYY> <HH:MM> <AM/PM> from <Source_system_IPAddress>
```

```
There were <n> unsuccessful login attempts since last successful login
```

If a user logs into the System Manager command-line interface and then logs in to the System Manager web console, then this message also displays the successful and unsuccessful login attempts with the Timestamp and IP address details of the source system.

*** Note:**

After each successful login, on the System Manager web console or CLI, System Manager resets the unsuccessful login count.

- If the login attempt is successful without any unsuccessful login attempt, System Manager displays the following message. For example:

```
You have successfully logged into System Manager
```

```
Your last successful login was at <Month> <Date>, <YYYY> <HH:MM>  
<AM/PM> from <Source_system_IPAddress>
```

```
There were 0 unsuccessful login attempts since last successful login
```

- If the login attempt is successful after one or more unsuccessful login attempts, System Manager displays the following message. For example:

```
You have successfully logged into System Manager
```

```
Your last successful login was at September 16, 2020 11:18 AM from  
13.12.18.24
```

```
Your last unsuccessful login was at September 16, 2020 11:20 AM  
from 13.12.18.24
```

```
There were 1 unsuccessful login attempts since last successful login
```

System Manager alert messages at login

When you log in to the System Manager web console, depending on the system and element configurations, System Manager can display one or more of the following messages.

System Manager license error message

System Manager requires a valid license from Avaya. Use of this software without a valid license is a violation of the Avaya EULA and can result in legal action by Avaya. Please install a System Manager license file on WebLM or immediately discontinue use of this software.

To resolve this error, install the System Manager license file.

System Manager Geographic Redundancy feature entitlement license error message

The System Manager Geo-Redundancy Feature requires a valid license from Avaya with the Geo-Redundancy Feature Entitlement. Use of the System Manager Geo-Redundancy Feature without a valid license from Avaya with the Geo-Redundancy Feature Entitlement is a violation of the Avaya EULA and can result in legal action by Avaya. Please install a System Manager License file on WebLM with the Geo-Redundancy Feature Entitlement or immediately disable use System Manager Geo-Redundancy.

To resolve this error, install the System Manager license file.

Appliance Virtualization Platform license error message

Warning - This instance of Avaya Aura® Appliance Virtualization Platform is currently unlicensed. Note: each instance of Appliance Virtualization Platform is separately licensed and ordered. For example, if you or the Avaya Channel Partner would like to install two instances of the same type of products, then two products of that type must be ordered. Appliance Virtualization Platform is licensed via WebLM with license files obtained from PLDS. Please consult the Appliance Virtualization Platform 7.1.2 or later user documentation for more details onto how to acquire and install a license file. This message will continue to be displayed until the system is correctly licensed. Failure to license the system is in violation of the Avaya Global Software License Agreement for the product. Please immediately place an order using the normal Avaya ordering process to obtain the required license. Avaya Aura® Appliance Virtualization Platform (AVP) License Error Mode: Grace period expires: 01/09/2017 If the grace period expires, AVP will enter License Restricted Mode and AVP Management functionality will be restricted. Check license status on / Home/Services/Solution Deployment Manager (SDM)/Application Management/ Location/Hosts/ for impacted AVP hosts.

If the grace period of the Appliance Virtualization Platform license file is less than 15 days or Appliance Virtualization Platform is in License Error Mode or License Restricted Mode, System Manager displays the AVP License Error message.

For information about Appliance Virtualization Platform license and administration, see *Deploying Avaya Aura® Appliance Virtualization Platform*.

Session Manager emergency Dial Pattern routes message

System Manager displays the following message only on the Release 8.1.3 system:

No Session Manager emergency Dial Pattern routes are administered. To insure proper emergency number handling and routing, please administer Routing Locations, Routing Policies, and Dial Patterns per emergency calling guidelines.

Note:

From Release 8.1.3.1, System Manager displays the Session Manager emergency Dial Pattern routes notification message for Emergency Location Management Solution in the **Notifications** widget on the dashboard.

For information about administering routing locations, routing policies, and dial patterns for emergency calling, see *Administering Avaya Aura® Session Manager*.

Change Password field descriptions

Use this page to change the password for your account.

Name	Description
Current password	The existing password.
New password	The new password that you must set.
Confirm new password	Retype the new password.

Button	Description
Save	Changes the password.
Cancel	Cancels the change password operation and closes the Change Password page.

Logon information for users with administrator privilege

This logon information applies only to users with administrator privilege.

- After installation, when you log on to System Manager for the first time, type the administrator privilege credentials that you created during the deployment or upgrade of System Manager.

The system displays the Forced Change Password page. The Forced Change Password page does not contain the **Cancel** button. You must change the password when you log on to the system using the default password.

Important:

The system displays a message about the invalid logon in the following scenarios:

- Using a disabled account to log on
- Using an invalid password
- Exceeding the maximum number of failed logon attempts limit
- Using an expired password

The password must contain a combination of alphanumeric and special characters. For more information about the password strength policy, see “Password strength policy enforcement”.

Certificate based authentication

Certificate-based authentication overview

With System Manager 7.1, you can disable the password-based login and configure the certificate-based authentication for system login. The certificates for this authentication can be issued by:

- System Manager as the default certificate authority
 - Using System Manager user interface
 - Using System Manager CLI
- Third-party certificate authority

Configuring username retrieval from certificate

Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > External Authentication**.
3. On the External Identity Repositories page, click **Configure** in the Authentication Servers section.
4. On the Authentication Servers page, navigate to **Provision User Certificate Authentication**.
5. Select the **Certificate Purpose**.
6. Select the certificate field names to be used to retrieve the username.
7. Click **Save**.

Enabling certificate-based authentication

Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Configuration > Security Configuration**.
3. On the Security Configuration page, click **SMGR**.
4. In **Cert based authentication** section, enable the required options.

 Caution:

Enabling the **System Manager User Interface** option disables the password-based authentication for the System Manager user interface. The System Manager user interface is accessible using a valid certificate.

5. Click **Commit**.

Creating certificate using System Manager default CA

Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. Click **RA Functions > Add End Entity**.
4. Type the **Username**.
5. Type the **Password** and **Confirm Password**.

The password is mandatory for each end entity. Without the password, you cannot generate the certificate from System Manager because you require the password to authenticate the certificate generation request.

6. Click **Add**.

The system displays the message `End Entity <username> added successfully`.

7. In the navigation pane, click **Public Web**.
8. Click **Create Browser Certificate**.
9. Type the **Username** and **Password**.
10. Click **OK**.
11. Click **Enroll**.
12. **(Optional)** If the certificate is not installed automatically, click **Install Certificate**.

Next steps

If the automatic certificate installation fails, download the certificate and install it in the web browser manually.

Generating certificate from CLI

About this task

Use this procedure to generate a user-specific certificate for System Manager to facilitate the certificate-based authentication.

Before you begin

- To reach the System Manager command line interface, use one of the following methods:
 - Open vSphere Web Client and click on the **Console** tab or the  icon.
 - Use PuTTY.

Procedure

1. Log in to the System Manager command-line interface.
2. Type `getUserAuthCert`, and press `Enter`.
3. Provide the user password and press `Enter`.

4. Type the enrollment password and press `Enter`.
5. Retype the enrollment password and press `Enter`.
6. Type a password for the keystore and press `Enter`.
7. Retype the keystore password and press `Enter`.
8. Type the username and press `Enter`.
9. To generate an identity certificate in the corresponding format, type one of the following and press `Enter`:
 - For `PKCS12` format, type `1`.
 - For `JKS` format, type `2`.
 - For `PEM` format, type `3`.
 - For `PEM-UNENC` format, type `4`.
 - For `PEM-PKCS8` format, type `5`.
 - For `PEM-PKCS8-AES256-CBC` format, type `6`.
10. Press `Enter`.

The system displays the path of the generated identity certificate.
11. Download the certificate and install it in the web browser.

Certificate-based SSH login

Certificate-based CLI access overview

System Manager does not provide a default Command Line Interface (CLI) access to a user. To gain CLI access, an administrator must provide Base OS permissions to the user.

CLI access can be enabled using the following:

- System Manager Web Console
- Putty-CAC

Enabling CLI access using the System Manager web console

Before you begin

Ensure that you add the identity certificate in the browser manually or use an ActivClient tool to add the CAC certificate in the browser.

Procedure

1. Log in to the System Manager web console.
2. On the top-right corner of the System Manager Dashboard, click the **Tool** icon.
3. Click **Manage Command Line Access**.

4. In the System Manager Command Line Access dialog box, click **Enable**.
 - The system creates the user on System Manager OS with the login name provided in the certificate.
 - System Manager Web Console provides CLI access to the user.

Enabling CLI using Putty-CAC

Procedure

1. Download Putty-CAC for certificate-based login from <https://risacher.org/putty-cac/>.
2. Open a putty session.
3. In the **Host name (or IP address)** field, enter the hostname or IP address of System Manager.
4. In the navigation pane, expand the **Connection > SSH**, and click **CAPI**.
Options controlling MS CAPI SSH authentication dialog box opens.
5. Select the **Authentication methods** check box.
6. Click **Browse** to select your identity certificate.

 Note:

Ensure that you add the identity certificate in the browser manually or use an ActivClient tool to add the CAC certificate in the browser.

7. Click **OK** to select the certificate for CAPI Authentication.
8. Click **Open** to start the SSH session.
9. On the CLI, type the username provided in the certificate and press the **Enter** key on the keyboard.
The system displays the pop-up window, Signing data with your private exchange key.
10. On the Signing data with your private exchange key window, click **OK**.
The system provides access to the System Manager CLI.

Tenant Management web console

From the System Manager web console, the user with tenant administrator permissions can perform the following:

- View all tenants in the Tenants panel for which the tenant administrator has permissions. By default, the system selects the first tenant in the list.

Tenants	Level 1	Level 2	Level 3
☒ Citi ☐ BMW	☐ Pune (Citi) ☐ B'lore (Citi) ☐ Cohin (Citi)	☐ Pune HLoan (Pune) ☐ Pune SLoan (Pune)	☐ HLoan Disburse (Pune HLoan) ☐ HLoan Customer (Pune HLoan)

- View all child levels of the selected item in the subsequent panel.
 - When the tenant administrator selects an item, the system:
 - Selects all parent items of the selected item.
 - Displays the child levels of the selected item in the subsequent panel.
 - When the tenant administrator clears all selections in a panel, the system displays the default selection.

*** Note:**

Select at least one tenant. If you do not select a tenant, the system displays a message.

- Gain access to:
 - User Management
 - Communication Manager. Only if the role has permissions to Communication Manager

Navigation	User Provision				
User Management Manage users, shared user resources and provision users Communication Manager Manage Communication Manager 5.2 and higher elements	<table border="1"> <thead> <tr> <th>SIP Users</th> <th>CM Users</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>30</td> </tr> </tbody> </table>	SIP Users	CM Users	1	30
SIP Users	CM Users				
1	30				

- View the **User Provision** section that displays the number of SIP and H.323 users to which the tenant administrator has permissions.
- Select the organizational hierarchy of the tenant and features in the **Graph** section and generate graphs.

The features include EC500, Presence, Conferencing, H.323 users, and SIP users. The system generates Pie charts based on the user selection. If the tenant administrator does not select a level from the Organization level field, the system generates graphs based on items selected in the panels.

Password and security policies for all administrators

Password aging policy enforcement

The password aging policy has the following time-based password thresholds:

- Minimum password age
- Password expiration warning
- Password expiration

The system administrator configures the password threshold in days.

Password threshold	Result of the expiry of the password aging policy threshold
Minimum password age	You cannot change the password until the minimum password age is reached. For example, you cannot change the password within three days after the last change was made.
Password expiration warning	The system sends a password expiration warning when the password is about to expire and before the password expires.
Password expiration period	The system prompts you to change the password after the password threshold expires and before the threshold to disable the account. The password remains locked until the system administrator resets the password.

Password strength policy enforcement

The password strength policy that the system administrator defines enforces the following constraints:

- Passwords must be 6 to 25 characters long. The default character length is 14.
- Passwords must contain a combination of the following characters: a-z, A-Z, 0-9, {, }, |, (,), <, >, ,, /, ., =, [,], ^, _, @, !, \$, %, &, -, +, ", :, ?, `, \, or ;
- Passwords do not require a minimum character type. However, the default is one lowercase, one uppercase, one numeric, and one special character. The sum cannot exceed the minimum total length.
- Password can contain a maximum of 2 consecutive characters. The valid values are from 1 through 5. The default value is 2.
- Password can contain a maximum number of 4 consecutive characters from the same character type. The valid values are from 1 through 5. The default value is 4.
- Passwords must not be your user ID, in forward or reverse order.
- Passwords must not be a value based on a dictionary word.

When you enable the password strength policy, if the password does not meet the password strength policy, the system rejects the password.

You can disable the password strength policy.

Password history policy enforcement

The password history policy verifies that a password is new. The blocked passwords can range from 1 to 99. The default value for blocking the number of previous password is 10.

Password lockout policy enforcement

The lockout policy limits the number of unsuccessful attempts that you can make to access System Manager. The system locks System Manager for use after a specified number of login attempts. By default, if you make consecutive attempts within 10 minutes, the system locks you out for 2 minutes after five unsuccessful attempts.

Editing password policies

About this task

A user with the system administrator role can edit the password settings.

Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **Security > Policies**.
3. In the **Password Policy** section, click **Edit**.
4. On the Password Policy page, edit the required fields.
5. Click **Save**.

For more information on password policies, contact the system administrator.

6. **(Optional)** To undo your changes and return to the previous page, click **Cancel**.

[Password policies field descriptions](#) on page 61

Password policies field descriptions

This page is applicable only for users with the username admin.

Aging

Name	Description
Enforce password aging policy	The option to enable or disable the password aging policies. By default, the password aging policy is disabled. To enforce the password aging policies, select the check box. If you clear the check box, the password aging policy is not applicable.
Expiration period	The maximum number of days to maintain the password. The default value is 90. The valid values are from 2 through 365.
Expiration warning	The number of days for password expiry before which the password expiration warning message must be sent to the user. The valid values are from 1 through 15. The default value is 1.
Minimum age for password change	The minimum number of days for password age. The valid values are from 0 through 7. The default value is 3. Ensure that the expiration period is greater than the minimum password age.
Enable expired password change	If this is enabled, you can change the password after it expires. If this is disabled, only the system administrator can change the password. When you log in with the system administrator-provided password, you must change the password.

History

Name	Description
Enforce policy against previously used passwords	The option to enable or disable the password policy against previously used passwords. By default, the password policy against previously used passwords is disabled. To enforce the password policy against previously used passwords, select the check box. If you clear the check box, the password policy against previously used passwords is not applicable.
Previous passwords blocked	The number of latest passwords that the system maintains in history. You cannot reset your password to these values. The valid values are from 1 through 99. From Release 8.1.3, the default value is 10. For earlier release system, the default value is 6.

Strength

Name	Description
Enforce password content standards	The option to enable or disable the password content standards. By default, the password content standards is disabled. To enforce the password content standards, select the check box. If you clear the check box, the password content standards is not applicable.
Minimum total length	The minimum number of characters to use in the password. The password can be of 6 to 25 characters. From Release 8.1.3, the default value is 14. For earlier release system, the default value is 8.
Minimum by character Type: Lower case	The minimum number of lowercase characters to use in the password. The default value is 1.
Minimum by character Type: Upper case	The minimum number of uppercase characters to use in the password. The default value is 1.
Minimum by character Type: Numeric case	The minimum number of numeric characters to use in the password. The default value is 1.
Minimum by character Type: Special case	The minimum number of special characters to use in the password. The default value is 1.

Table continues...

Name	Description
Maximum repeated consecutive characters	The maximum number of repeated consecutive characters. The valid values are from 1 through 5. The default value is 2. For example, if the maximum repeated consecutive characters value is set to 2: - Valid password is: Buildd123\$ - Invalid password is: Builddd123\$
Maximum consecutive characters from same character type	The maximum number of consecutive characters from the same character type. The valid values are from 1 through 5. The default value is 4. For example, if the maximum repeated consecutive characters of the same character type is set to 4: - Valid password is: Build123\$ - Invalid password is: Build12345\$

Lockout

Name	Description
Lockout	The option to enable or disable lockout after failed log-in attempts. By default, this is disabled. To enforce the lockout after failed log-in attempts, select the check box. If you clear the check box, the lockout after failed log-in attempts is not applicable.
Consecutive Invalid Login Attempts	The number of failed attempts before the lockout. The valid values are from 1 through 20. The default value is 5.
Interval for Consecutive Invalid Login Attempts	The time interval in minutes between invalid log-in attempts. The valid values are from 0 through 120. The default value is 10.
Lockout Time	The number of minutes that the account must be locked after invalid log-in attempts. The valid values are from 0 through 120. The default value is 2.

For example, with the default values configuration, if you reach up to 5 number of consecutive invalid login attempts within 10 minutes, then the system locks out. After 2 minutes, you can log in.

Within 2 minutes, if you retry to log in, then the timer keeps increasing with the specified limit of 2 minutes.

Button	Description
Save	Saves all the entries on the Edit Password Policies page.
Cancel	Cancels the changes and returns to the previous page.

Managing System Manager password through CLI

setSecurityPolicy command

With Release 8.1.3, you can modify the default password policy settings of System Manager using the **setSecurityPolicy** command. This command is only applicable for changing or setting up the password for the CLI or root user created during deployment.

 Note:

When you create a user through the System Manager web console, the System Manager web console password policy applies.

You can run the **setSecurityPolicy** command in the following modes:

- **Interactive mode:** This is the default mode for operating this command. You can display, change, restore, and refresh the password policy settings.
- **Non-interactive mode:** You can view the status, display the current settings, restore the standard default settings, and refresh the current profile, including any custom settings.

Syntax

```
setSecurityPolicy
```

Displays the interactive mode where you can change the password policy settings.

Syntax

```
setSecurityPolicy [--status] [--display-only] [--restore-standard] [--refresh-custom]
```

--status	Displays the password policy settings status.
--display-only	Displays all the password policy settings.
--restore-standard	Removes all customized values and restores the password policy settings to the default profile settings.
[--refresh-custom]	Refreshes the custom profile settings in case of backup and restore.

- [Displaying the password policies](#) on page 69
- [Restoring the default password policy settings](#) on page 69
- [Refreshing the default password policy settings](#) on page 70

Managing the password policies through CLI

Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Type **setSecurityPolicy**.
3. When the system prompts for the [sudo] password, type the password.

System Manager displays the set of options.

For example:

```
Main Menu:

    Loaded Profile Type: standard
    Custom Profile: yes    (Custom Settings: 1)

1) Display Current Property Settings
2) Change Property Settings
3) Restore Standard Property Settings and Exit
4) Refresh Current Property Settings and Exit
5) Exit (no settings changed)

Select Action:
```

Where:

- **Loaded Profile Type:** Specifies the profile selected during deployment. The options are:
 - **standard**
 - **DoD/Hardened**
- **Custom Profile:** The options are:
 - **no:** Specifies that System Manager is using the default values from the loaded profile. This is the default value.
 - **yes:** Specifies that a user has made some changes to customize the security profile.

When the **Custom Profile** setting is **yes**, System Manager displays the **Custom Settings** field with the number of changes made to the default password profile.

For example:

```
Custom Settings: <n>
```

- **Restore Standard Property Settings and Exit:** When you make a change to the password policy settings, System Manager displays this option to remove all the changes and restore the standard property settings to the default values.
4. In **Select Action**, type one of the following:
 - **1:** to display the current property settings.
 - **2:** to change the current property settings.
 - **3:** to restore the standard property settings and exit the command.

- **4:** to refresh the current property settings and exit the command.
- **5:** to exit the command without saving the changes.

Changing the password policies through CLI Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Type **setSecurityPolicy**.
3. When the system prompts for the [sudo] password, type the password.

System Manager displays the set of options.

For example:

```
Main Menu:

    Loaded Profile Type: standard
    Custom Profile: yes    (Custom Settings: 1)

1) Display Current Property Settings
2) Change Property Settings
3) Restore Standard Property Settings and Exit
4) Refresh Current Property Settings and Exit
5) Exit (no settings changed)

Select Action:
```

4. In **Select Action**, type 2.

System Manager displays the set of options to change the parameters.

```
Change Property Settings:

    Loaded Profile Type: standard
    Custom Profile: yes    (Custom Settings: 1)

Note: [Current Value: M=modified C=customized D=disabled]

1) Return to Main Menu
2) Change minimum password length [14]
3) Change minimum days between password changes [1]
4) Change maximum days before password expires [-1: D]
5) Change password expiration warning (days) [10]
6) Change minimum required uppercase characters [0: D]
7) Change minimum required lowercase characters [0: D]
8) Change minimum required numeric characters [0: D]
9) Change minimum required special characters [0: D]
10) Change required difference from previous password [4]
11) Change minimum required character classes [3]
12) Change maximum repeated characters [2]
13) Change maximum class repeat [10: C]
14) Change inactive account disable time (days) [0]
15) Change remember previous passwords [10]
16) Change max login attempts before lock out [0: D]
17) Change root lock out allowed [no]
18) Change lock out time (seconds) [900]
```

```
19) Change unlock time (seconds) [600]
20) Change delay (seconds) after failed login attempt [1]
```

Select Action:

5. In **Select Action**, type the number for which you want to change the value.

For example, if you want to change the minimum password length, type 2.

When you type 2, System Manager displays the following prompt.

```
Changing minimum password length:
  Current Value: 14 (Minimum: 6, Maximum: 25)

Enter new value:
```

6. In **Enter new value**, type the required value.

When you type the value, System Manager displays the following prompt with the number of pending changes made.

For example:

```
Change Property Settings:

  Loaded Profile Type: standard
    Custom Profile: yes (Custom Settings: 1)
    Pending Changes: 1

Note: [Current Value: M=modified C=customized D=disabled]

1) Return to Main Menu
2) Change minimum password length [10: M]
3) Change minimum days between password changes [1]
4) Change maximum days before password expires [-1: D]
5) Change password expiration warning (days) [10]
6) Change minimum required uppercase characters [0: D]
7) Change minimum required lowercase characters [0: D]
8) Change minimum required numeric characters [0: D]
9) Change minimum required special characters [0: D]
10) Change required difference from previous password [4]
11) Change minimum required character classes [3]
12) Change maximum repeated characters [2]
13) Change maximum class repeat [10: C]
14) Change inactive account disable time (days) [0]
15) Change remember previous passwords [10]
16) Change max login attempts before lock out [0: D]
17) Change root lock out allowed [no]
18) Change lock out time (seconds) [900]
19) Change unlock time (seconds) [600]
20) Change delay (seconds) after failed login attempt [1]

Select Action:
```

7. To return to the main menu, in **Select Action**, type 1.

System Manager displays the main menu.

For example:

```
Main Menu:

  Loaded Profile Type: standard
    Custom Profile: yes (Custom Settings: 1)
    Pending Changes: 1
```

- ```

1) Display Current Property Settings
2) Change Property Settings
3) Apply Changes and Exit
4) Exit (discarding all pending changes)

```

Select Action:

8. To apply the changes to the password policy settings, in **Select Action**, type 3.

System Manager applies the profile changes, updates the system settings, and displays the number of changes made to the password policy settings.

For example:

```

Loaded Profile Type: standard
 Custom Profile: yes (Custom Settings: 1)
 Pending Changes: 1

Applying Profile Changes:

 Loaded Profile Type: standard
 Custom Profile: yes (Custom Settings: 2)

Updating System Settings:
 Executing pam-settings.sh
 Executing password-policy.sh

```

## Viewing the password policy status

### Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Type **setSecurityPolicy --status**, and press Enter.

System Manager displays the password policy status.

Following is the example where the default password policy has not been changed.

```

Loaded Profile Type: standard
Custom Profile: no

```

Following is the example where one setting of the default password policy has been changed.

```

Loaded Profile Type: standard
Custom Profile: yes (Custom Settings: 1)

```

## Displaying the password policies

### Procedure

1. Log in to the System Manager command line interface with CLI user credentials that you create during application deployment.
2. Type **setSecurityPolicy --display-only**, and press Enter.

System Manager displays the configured password policy.

For example:

```
setSecurityPolicy --display-only

Loaded Profile Type: standard
Custom Profile: no
```

| Property                                    | Value | Notes    |
|---------------------------------------------|-------|----------|
| minimum password length:                    | 14    |          |
| minimum days between password changes:      | 1     |          |
| maximum days before password expires:       | -1    | Disabled |
| password expiration warning (days):         | 10    |          |
| minimum required uppercase characters:      | 0     | Disabled |
| minimum required lowercase characters:      | 0     | Disabled |
| minimum required numeric characters:        | 0     | Disabled |
| minimum required special characters:        | 0     | Disabled |
| required difference from previous password: | 4     |          |
| minimum required character classes:         | 3     |          |
| maximum repeated characters:                | 2     |          |
| maximum class repeat:                       | 4     |          |
| inactive account disable time (days):       | 0     |          |
| remember previous passwords:                | 10    |          |
| max login attempts before lock out:         | 0     | Disabled |
| root lock out allowed:                      | no    |          |
| lock out time (seconds):                    | 900   |          |
| unlock time (seconds):                      | 600   |          |
| delay (seconds) after failed login attempt: | 1     |          |

## Restoring the default password policy settings

### About this task

When you make some changes to customize the default password policy and later to restore the default password policy for the current profile, use the following procedure.

- In the Interactive mode, do the following:
  1. Type **setSecurityPolicy**.
  2. When the system prompts for the [sudo] password, type the password.

System Manager displays the set of options.

For example:

```
Main Menu:

Loaded Profile Type: standard
```

```
Custom Profile: yes (Custom Settings: <n>)
```

- ```
1) Display Current Property Settings
2) Change Property Settings
3) Restore Standard Property Settings and Exit
4) Refresh Current Property Settings and Exit
5) Exit (no settings changed)
```

```
Select Action:
```

3. In **Select Action**, type 3.

System Manager updates the system settings and restores the default password policy settings.

```
Loaded Profile Type: standard
Custom Profile: no
```

```
Updating System Settings:
  Executing pam-settings.sh
  Executing password-policy.sh
```

- In the Non-interactive mode, do the following:

1. Type **setSecurityPolicy --restore-standard**, and press Enter.
2. When the system prompts for the [sudo] password, type the password.

System Manager updates the system settings and restores the default password policy settings.

```
Loaded Profile Type: standard
Custom Profile: no
```

```
Updating System Settings:
  Executing pam-settings.sh
  Executing password-policy.sh
```

Refreshing the default password policy settings

About this task

When a custom profile is restored during a backup and restore, use the following procedure to apply the changes to the system settings.

- In the Interactive mode, do the following:

1. Type **setSecurityPolicy**.
2. When the system prompts for the [sudo] password, type the password.

System Manager displays the set of options.

For example:

```
Main Menu:
```

```
Loaded Profile Type: standard
Custom Profile: no
```

- ```
1) Display Current Property Settings
```

```

2) Change Property Settings
3) Refresh Current Property Settings and Exit
4) Exit (no settings changed)

```

Select Action:

3. In **Select Action**, type 4.

System Manager refreshes the system settings.

- In the Non-interactive mode, do the following:

1. Type `setSecurityPolicy --refresh-custom`, and press Enter.
2. When the system prompts for the [sudo] password, type the password.

System Manager updates the system settings and refreshes the default password policy settings.

## Inactive session termination policy

By default, the system suspends a user session after 30 minutes of inactivity. When the session becomes inactive, to access System Manager, you must log on to System Manager again.

## Editing Session Properties

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **Security > Policies**.
3. On the Policies page, in the Session Properties section, click **Edit**.
4. On the Session Properties page, edit the required fields.
5. Click **Save**.

## Security settings

System Manager provides a customizable logon banner that appears when a user logs on to the system. Customers who have security policies require the network equipment to display a specific message to users when they log in using the customizable banner.

## Login warning banner

System Manager provides the following:

- Login warning banner: The system administrator can change the text in the login warning banner.

- Additional Postlogin warning banner: In the security deployment, after you log in, System Manager displays a warning banner. You can change only the configurable part of the message.

The Last Login Data window displays the following:

- Last successful login
- Server for the last successful login
- Number of unsuccessful login attempts (if any)

## Editing the login warning banner

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **Security > Policies**.
3. On the Policies page, in the Security Settings section, click **Edit**.
4. On the Security Settings page, do the following:
  - a. In the Login Warning Banner area, edit the text as appropriate.
  - b. **(Optional)** For security deployments, in the Additional Post Login Banner Message area, change only the configurable part of the additional text as appropriate.

 **Note:**

You cannot change the actual message. You can change only the configurable part of the post-login banner text.

5. Click **Save**.

## Security Settings field descriptions

| Name                                        | Description                                                                                                                                                                   |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Login Warning Banner</b>                 | The text displayed during System Manager login. The system administrator can change this text.                                                                                |
| <b>Additional Post Login Banner Message</b> | The text displayed after logging on to System Manager. The text contains two components, the login banner, and the additional text. Only the additional text is configurable. |

| Button        | Description                                            |
|---------------|--------------------------------------------------------|
| <b>Save</b>   | Saves the changes on the Login Warning Banner page.    |
| <b>Cancel</b> | Ignores your changes and returns to the previous page. |

---

## Customized interface

System Manager provides the feature to add a logo to the System Manager web interface. Organizations can customize the logo without removing the Avaya logo.

---

## Adding the corporate logo

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **Security > Policies**.
3. On the Policies page, in the **Customized Interface** section, click **Edit**.
4. On the Customized Interface page, in the **Upload File** section, click **Browse** and select an image file to upload.  
  
The system supports PNG, GIF, and JPEG image file formats. The image dimensions must be 100x51 pixels.
5. In the **Change Image ALT Attribute** section, type the alternate text for the system to display.
6. Click **Save**.

System Manager web console displays the corporate logo on the upper-right corner of the page.

## Reimporting the SSO cookie domain value

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **Security > Policies**.
3. In the Single Sign-on Cookie Domain section, click **Edit**.
4. In **Single Sign-on Cookie Domain**, select the appropriate domain based on the FQDN of the servers you deployed.
5. Click **Save**.
6. Log out and close all browser windows you opened when logging on to the System Manager server.
7. To accept the updated cookies from the new Single Sign-On (SSO) cookie domain name, clear the browser cache.

---

## Administrative users

---

## Viewing administrative user details

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > Administrative Users**.
3. On the Administrative Users page, select the required user ID.

The system displays the User Details page with the administrative user details.

---

## Adding an administrative user

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > Administrative Users**.
3. On the Administrative Users page, click **Add**.  
The system displays the Step 1: Identify the new user page.
4. On the Add New Administrative User page, enter the user ID, full name, and email address.
5. In the **Authentication Type** field, select **Local** or **External**.
6. Do one of the following:
  - In the **Temporary password** and **Re-enter password** fields, type the same password.
  - Click **Generate Password**.

 **Note:**

The auto-generated password applies if **Authentication Type** is set to **Local**.

7. Click **Commit and Continue**.  
The system displays the Step 2: Assign Role(s) page.
8. Select the required roles to be assigned to the user, and click **Commit**.

---

## Editing administrative user details

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > Administrative Users**.
3. On the Administrative Users page, select the required user ID.
4. On the User Details page, make the required changes.
5. Click **Commit**.

---

## Editing administrative user roles

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > Administrative Users**.

3. On the Administrative Users page, select the required user ID.
4. Click **Select Roles**.
5. On the User Roles page, select the required roles for the administrative user and click **Commit**.

---

## Enabling an administrative user

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > Administrative Users**.
3. On the Administrative Users page, click the required user ID.  
The system displays the User Details page.
4. In **User Status**, click **Enabled**.
5. Click **Commit**.

---

## Disabling an administrative user

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > Administrative Users**.
3. On the Administrative Users page, do one of the following:
  - Select the user, and click **Disable**.
  - Click the required user ID, click **Disabled**, and click **Commit**.

---

## Deleting an administrative user

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > Administrative Users**.
3. On the Administrative Users page, select the users to delete.
4. Click **Delete**.
5. On the Delete Users page, click **Delete** to confirm the user deletion.

---

## Terminating administrative user sessions

### Procedure

1. On the System Manager web console, click **Users > Administrators**.
2. In the navigation pane, click **User Services > Administrative Users**.
3. On the Administrative Users page, click **Active Sessions**.
4. On the Active Sessions page, select the sessions to terminate.
5. Click **Terminate**.

---

## Administrative Users field descriptions

| Name           | Description                                                |
|----------------|------------------------------------------------------------|
| User ID        | The unique user identification of the administrative user. |
| Name           | The name of the administrative user.                       |
| Roles          | The list of roles assigned to the administrative user.     |
| Type           | The type of the administrative user.                       |
| Account Status | The status of the administrative user's account.           |

| Button          | Description                                                                                       |

## Add New Administrative User field descriptions

### Step 1: Identify the new user

| Name    | Description                                            |
|---------|--------------------------------------------------------|
| User ID | Unique user identification of the administrative user. |

*Table continues...*

| Name                       | Description                                                                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authentication Type</b> | The type of authentication. The options are: <ul style="list-style-type: none"> <li>• <b>Local:</b> Avaya Authentication Service performs the user login authentication.</li> <li>• <b>External:</b> The enterprise authenticates the user login.</li> </ul> |
| <b>Full Name</b>           | The full name of the administrative user.                                                                                                                                                                                                                    |
| <b>E-Mail</b>              | The email address of the administrative user.                                                                                                                                                                                                                |
| <b>Temporary Password</b>  | The first-time login password for the administrative user account.                                                                                                                                                                                           |
| <b>Re-enter Password</b>   | The password that you re-enter for confirmation.                                                                                                                                                                                                             |

| Button                     | Description                                                     |
|----------------------------|-----------------------------------------------------------------|
| <b>Generate Password</b>   | Generates a password for the administrative user.               |
| <b>Commit and Continue</b> | Saves the user details and takes you to Step 2: Assign Role(s). |
| <b>Cancel</b>              | Cancels the operation for adding an administrative user.        |

## Step 2: Assign Role(s)

| Button             | Description                               |
|--------------------|-------------------------------------------|
| <b>Role Name</b>   | The name of the role.                     |
| <b>Elements</b>    | The elements that are a part of the role. |
| <b>Description</b> | A description of the role.                |

| Button        | Description                                                                    |
|---------------|--------------------------------------------------------------------------------|
| <b>Commit</b> | Saves the selected user roles for the new administrative user.                 |
| <b>Cancel</b> | Cancels the operation for selecting the roles for the new administrative user. |

# Chapter 3: Directory synchronization

---

## Directory synchronization overview

System Manager integrates with Lightweight Directory Access Protocol (LDAP) directory servers to provide the following functions:

- Synchronization of users from the LDAP directory server to System Manager User Management.
- Bidirectional synchronization of the selected user attributes from System Manager to the LDAP directory server.

LDAP supports the following directory servers for synchronization:

- Microsoft Active Directory 2008
- Microsoft Active Directory 2012
- Microsoft Active Directory 2016
- Microsoft Active Directory 2019
- OpenLDAP 2.4.21
- IBM Domino 7.0
- Novell eDirectory 8.8
- SunOne Directory/Java System Directory 6.3

From the System Manager web console, you can run the directory synchronization engine as an on-demand job. You can also schedule the data synchronization to and from the enterprise directory. During synchronization of information to the enterprise directory server, System Manager modifies the user data that is stored in the LDAP directory server.

From the System Manager web console, you can configure bidirectional attribute mapping through the Directory Synchronization user interface. The bidirectional synchronization does not synchronize the user in the LDAP directory synchronization that is created from the System Manager web console and the System Manager bulk import utility. The bidirectional synchronization only synchronizes the attributes for the user that you synchronized from the LDAP directory server.

You can perform LDAP synchronization of Microsoft Active Directory or other supported directory server administrator roles with System Manager administrator roles. The capability includes system roles and custom roles on System Manager.

### Synchronization by using the user provisioning rule

You can synchronize the communication data, such as extensions, Messaging mail box, and telephone numbers, by using the user provisioning rule. You can map the user provisioning rule to more than one LDAP attribute. However, you cannot map the user provisioning rule to the same LDAP attribute twice.

---

## Results of synchronization from the LDAP directory server to System Manager

You can expect the following results when you run the directory synchronization job or when the system runs the scheduled job.

| Action                                                   | Provided                                                                                                  | Expected result                                              |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| Create a new user in the LDAP directory server.          | Add the user in the filter criteria.                                                                      | The system synchronizes the user in System Manager.          |
| Update the user attributes in the LDAP directory server. | The system adds the attributes in the mappings for the data source.                                       | The system updates the user attributes in System Manager.    |
| Change the filter criteria.                              | Remove the user from the filter criteria, and select the <b>Allow Deletion</b> check box.                 | The system permanently deletes the user from System Manager. |
| Delete a user in the LDAP directory server.              | Select the <b>Allow Deletion</b> check box for the data source , and leave the filter criteria unchanged. | The system permanently deletes the user from System Manager. |

---

## Results of synchronization from System Manager to the LDAP directory server

You can expect the following results when you run the directory synchronization job or when the system runs the scheduled job.

| Action                                                                                         | Provided                                                                                                                                           | Expected result                                                      |
|------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| Update the user attributes that are synchronized from LDAP directory server in System Manager. | The system adds the attributes in the mappings for that datasource, and the mapping synchronizes from System Manager to the LDAP directory server. | The system updates the user attributes in the LDAP directory server. |

---

## Limitations in the synchronization of the LDAP directory server

You can expect the following results when you run the directory synchronization job or when the system runs the scheduled job.

**Table 1: Synchronization from the LDAP directory server to System Manager**

| Action                                                                  | Expected result                                                                                                                                                                                                  |
|-------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Synchronize users from multiple LDAP directory servers.                 | The system creates different datasources for each directory server.<br><br>The system supports the authentication of two directory servers, the RADIUS server and the KERBEROS server, at a given point of time. |
| Modify the user attributes that the LDAP directory server synchronizes. | If you add the attributes in mappings for the datasource, the system overwrites the attributes from the synchronization job.                                                                                     |

**Table 2: Synchronization from System Manager to the LDAP directory server**

| Action                                                                                                    | Expected result                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Create a user in System Manager from the User Management interface or by using the bulk import operation. | The system does not synchronize the user in the LDAP directory server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Update the user attributes synchronized from the LDAP directory server in System Manager.                 | If you add the attributes in mappings for the datasource, the system updates the attributes in the LDAP directory server. You can synchronize only optional attributes from System Manager to the LDAP directory server.                                                                                                                                                                                                                                                                                                                               |
| Delete users in System Manager.                                                                           | The system does not delete the user from the LDAP directory server. The Directory Synchronization feature does not support the soft deletion or permanent deletion of the user from the LDAP directory server.<br><br>From System Manager Release 8.0 and later, you can delete the Enterprise/LDAP user from the System Manager web console. However, if the user is still available in the LDAP directory server, the system synchronizes the user in System Manager even after you delete the user from System Manager on next synchronization job. |

---

## Adding the synchronization datasource

### Procedure

1. On the System Manager web console, click **Users > Directory Synchronization**.
2. In the navigation pane, click **Sync Users**.

3. On the User Synchronization page, click the **Synchronization Datasources** tab.
4. Click **New**.
5. On the New User Synchronization Datasource page, complete the fields in the **Directory Parameters** section.
6. Click **Test Connection**.

If the connection fails, the system displays an external directory error message.

If the connection is successful, the system displays the status icon. Click the status icon to view the message. Continue with the next step to map attributes in System Manager to LDAP attributes.

The system displays five mandatory attributes of System Manager that are read-only values.

7. To add more attributes, click **Add Mapping**.

You can use an appropriate LDAP attribute to synchronize in System Manager. If the LDAP attributes that you select are invalid, the synchronization fails.

8. To add the user provisioning rule attribute, perform the following:

- a. Click **Add Mapping**, and select **User Provisioning Rule** from System Manager.

You cannot add the User Provisioning Rule attribute more than one time. After you select **User Provisioning Rule**, the system displays the User Provisioning Rule attribute as read-only.

- b. Select an LDAP attribute that you map to the user provisioning rule.

|   |                   |   |    |                        |        |
|---|-------------------|---|----|------------------------|--------|
|   | registeredAddress | + | -> | User Provisioning Rule | Remove |
| - | postalAddress     | - |    |                        |        |
| - | comment           | - |    |                        |        |

- c. To add more than one LDAP attribute, click plus (+).

You can map more than one LDAP attribute to the user provisioning rule attribute. When you map more than one attribute, the system appends the second and third attributes to the first LDAP attribute. For example, asia\_pune\_maint.

9. Click **Save**.

**\* Note:**

- For bidirectional synchronization of data in the LDAP directory with System Manager, select the two-way arrow icon in the **Attribute Parameters** section.
- The user provisioning rule data synchronization is unidirectional from the LDAP directory server to System Manager.
- In System Manager, you cannot create a user in Active Directory. With bidirectional synchronization, you can only edit the existing user in Active Directory.

During attribute mapping, the right arrow indicates that the system synchronizes from the LDAP server to System Manager. The left arrow indicates that the system synchronizes from System Manager to the LDAP server.

# Editing the synchronization datasource

## Procedure

1. On the System Manager web console, click **Users > Directory Synchronization**.
2. In the navigation pane, click **Sync Users**.
3. On the User Synchronization page, click the **Synchronization Datasources** tab and click the record that you must edit.
4. Click **Edit**.
5. On the Edit Synchronization Datasource page, change the required fields.
6. To modify the user provisioning rule attribute:
  - a. To add an LDAP attribute, click the plus (+).

You can map more than one LDAP attribute to the user provisioning rule attribute. When you map more than one attribute, the system appends the second and third attributes to the first LDAP attribute. For example, asia\_pune\_maint.

|                   |   |    |                        |        |
|-------------------|---|----|------------------------|--------|
| registeredAddress | + | -> | User Provisioning Rule | Remove |
| postalAddress     | - |    |                        |        |
| comment           | - |    |                        |        |

You cannot add the User Provisioning Rule attribute more than one time. After you click **User Provisioning Rule**, the system displays the User Provisioning Rule attribute as read-only.

- b. To remove the LDAP attribute, click the minus (-).
7. Click **Save**.

## Deleting a synchronization datasource

### Procedure

1. On the System Manager web console, click **Users > Directory Synchronization**.
2. In the navigation pane, click **Sync Users**.
3. On the User Synchronization page, click the **Synchronization Datasources** tab and click a record to delete.
4. Click **Delete**.

 **Note:**

If you synchronize a user by using the datasource that you selected for deletion, the delete operation fails. The system display the message `Data Source <Datasource Name> cannot be deleted as at least one enterprise CsUser references it.`

## User synchronization datasource field descriptions

### Directory Parameters

| Name                           | Example values                                                              | Description                                                                                                                              |
|--------------------------------|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Datasource Name</b>         | Win2K8ADA                                                                   | The name to identify the directory server. You might require the name later to create a synchronization job.                             |
| <b>Host</b>                    | 111.140.111.126                                                             | The IP address or the host name of the directory server that you synchronize users with.                                                 |
| <b>Principal</b>               | CN=Administrator,<br>CN=Users,DC=pan<br>sv8,DC=platform,D<br>C=avaya,DC=com | The user name of the directory server that has permissions to create or update users.                                                    |
| <b>Password</b>                | <password>                                                                  | The password to connect to the directory server.<br><br>From Release 8.1.3, you can enter up to 256 characters for the directory server. |
| <b>Port</b>                    | 389                                                                         | The port number of the directory<br><br>The default port is 389 for a non-SSL connection and 636 for an SSL connection.                  |
| <b>Base Distinguished Name</b> | CN=Users,DC=pan<br>sv8,DC=platform,D<br>C=avaya,DC=com                      | An element that works with the search scope or the hierarchy from where you synchronize the users.                                       |

*Table continues...*

| Name                             | Example values                     | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LDAP User Schema</b>          | inetOrgPerson                      | The schema that defines object classes by a list of attributes where the values are mandatory or optional. The schema might differ depending on your directory server. The default value is inetOrgPerson.                                                                                                                                                                                             |
| <b>Search Filter</b>             | (cn=Alex*)                         | The field that provides a mechanism to define the criteria for matching entries in an LDAP search operation.<br><br>For more information about Search filter, see <a href="http://msdn.microsoft.com/en-us/library/windows/desktop/aa746475(v=vs.85).aspx">http://msdn.microsoft.com/en-us/library/windows/desktop/aa746475(v=vs.85).aspx</a> .                                                        |
| <b>Use SSL</b>                   | False when you clear the check box | The option to use SSL to connect to directory server. The default port for an SSL connection is 636.<br><br> <b>Important:</b><br>When you add the certificate, you must select the <b>Import using TLS</b> option.<br><br>For more information about setting up the SSL connection, see Adding trusted certificates. |
| <b>Allow Deletions</b>           | False when you clear the check box | The option to delete a synchronized user that is already removed from the directory server.                                                                                                                                                                                                                                                                                                            |
| <b>Allow Null values in LDAP</b> | False when you clear the check box | The option to allow null values to be inserted by System Manager in LDAP.                                                                                                                                                                                                                                                                                                                              |
| <b>Test Connection</b>           | -                                  | The option to verify your LDAP connection.<br><br>Test the connection before you map attributes.                                                                                                                                                                                                                                                                                                       |

## Attribute Parameters

When you click **Test Connection** and after the test is complete, the system displays the LDAP attributes that you can administer.

When you remove the following attributes from the mapping page, the system does not remove the communication profile handle of the user:

- email
- otherEmail
- Microsoft Exchange Handle
- Microsoft SIP Handle
- IBM Sametime Handle

| LDAP Attribute    | System Manager Attribute | Description                                 |
|-------------------|--------------------------|---------------------------------------------|
| <b>objectGUID</b> | sourceUserKey            | The attribute that uniquely defines a user. |

## Creating the user synchronization job

### Procedure

1. On the System Manager web console, click **Users > Directory Synchronization**.
2. In the navigation pane, click **Sync Users**.
3. On the User Synchronization page, click the Active Synchronization Jobs tab.
4. Click **Create New Job**.

5. On the New User Synchronization Job page, select the datasource from which you want to synchronize.
6. Perform one of the following:
  - Click **Run Job** to run the job immediately.
  - Select the **Schedule job for future execution** check box to schedule the job at a later time.

You can delete a job that you scheduled to run in the future.

Every 7 seconds, the system fetches the job status and the number of users synchronized on the Active Synchronization Job tab. Therefore, you might not immediately see the status of the active synchronization job that is running.

## Scheduling a user synchronization job

### Procedure

1. On the System Manager web console, click **Users > Directory Synchronization**.
2. In the navigation pane, click **Sync Users**.
3. On the User Synchronization page, click the **Active Synchronization Jobs** tab.
4. Click **Create New Job**.
5. Perform the following:
  - a. On the New User Synchronization Job page, in the **Datasource Name** field, enter a datasource for which you want to schedule a job.
  - b. Select the **Schedule job for future execution** check box.
  - c. In the **Date** field, enter the date when you want to run the job.
  - d. In the **Time** field, enter the time when you want to run the job.
  - e. In the **Time Zone**, enter the time zone.
  - f. Select the **Repeat Job Execution** check box to repeat the job
  - g. Select the recurring interval in minutes, hours, days, weeks, or months.
6. Click **Schedule job for future execution**.

## Deleting a user synchronization job

### Procedure

1. On the System Manager web console, click **Users > Directory Synchronization**.
2. In the navigation pane, click **Sync Users**.
3. On the User Synchronization page, click the **Synchronization Job History** tab and select the job that you want to delete.
4. Click **Delete Job**.

Without any confirmation, the system deletes the job.

 **Note:**

You can delete a job that is scheduled to run in the future.

## User active synchronization job field descriptions

| Name                                     | Description                                       |
|------------------------------------------|---------------------------------------------------|
| <b>Datasource Name</b>                   | The name of the datasource                        |
| <b>Schedule job for future execution</b> | The option to schedule a user synchronization job |
| <b>Date</b>                              | The date on which you want to schedule the job    |
| <b>Time</b>                              | The time when you want to schedule the job        |
| <b>Time Zone</b>                         | The time zone closest to your location            |

| Button                                   | Description                                                                                                                                          |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Run Job</b>                           | Runs the user synchronization job that you specified.                                                                                                |
| <b>Schedule job for future execution</b> | Schedules a user synchronization job.<br>The system displays the button only when you select the <b>Schedule job for future execution</b> check box. |
| <b>Cancel</b>                            | Cancels the synchronization and displays the previous page.                                                                                          |

## Synchronization job history

The **Synchronization Job History** tab displays the history of jobs created for user synchronization and the result of each job execution. You can delete any entry from the list of user synchronization job by using the **Delete Job** link.

## Synchronization job history field descriptions

| Name              | Description                                                                                                                                                                                           |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>       | The datasource name for which the user synchronization job was executed.                                                                                                                              |
| <b>Start Time</b> | The start time of a user synchronization job.                                                                                                                                                         |
| <b>End Time</b>   | The time when a user synchronization job was completed.                                                                                                                                               |
| <b>Status</b>     | The status of the user synchronization job.                                                                                                                                                           |
| <b>Job Result</b> | The result of running a job.<br><br>To view the results of the user synchronization, click the <b>View Job Summary</b> link. The system displays the results on the Synchronization Job Summary page. |
| <b>Action</b>     | The <b>Delete Job</b> link that you use to delete the results of the user synchronization job.                                                                                                        |

| Icon                                                                                | Description                                                              |
|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
|  | Refreshes the information on the <b>Synchronization Job History</b> tab. |

---

## Viewing Job Summary

### Procedure

1. On the System Manager web console, click **Users > Directory Synchronization**.
2. In the navigation pane, click **Sync Users**.
3. On the User Synchronization page, click the **Synchronization Job History** tab.
4. In the **Job Result** column, click the **View Job Summary** link.

# Chapter 4: Geographic Redundancy

---

## Geographic Redundancy overview

Avaya Aura® provides System Manager Geographic Redundancy, a resiliency feature that handles scenarios where the primary System Manager server fails or the data network partially loses connectivity. In such scenarios, the system manages and administers products such as Avaya Aura® Session Manager and Avaya Aura® Communication Manager across the customer enterprise using the secondary System Manager server.

For customers who need highly fault-tolerant deployments, System Manager supports System Manager Geographic Redundancy deployments that can provide the Active-Standby mode of resiliency.

From Release 8.0.1, System Manager also supports Geographic Redundancy in a mixed deployment environment. The deployment environment can be any of the following:

- Avaya Aura® Virtualized Appliance (VA): Avaya-provided server, Avaya Aura® Appliance Virtualization Platform, based on the customized OEM version of VMware® ESXi 6.5.
- Avaya Aura® Virtualized Environment (VE): Customer-provided VMware infrastructure and Kernel-based Virtual Machine (KVM).
- Avaya Aura® on Infrastructure as a Service: Amazon Web Services, Microsoft Azure, Google Cloud Platform, and IBM Bluemix.
- Software-only environment: Deployment on the Red Hat Enterprise Linux operating system.

From Release 7.0.1, System Manager supports deployment on different server types and different deployment modes in Geographic Redundancy. System Manager supports mixed:

- Server constructs of Small, Medium, and Large Common Server Release 1, 2, and 3 constructs that are defined for use with System Manager Release 7.x. For example, the primary System Manager server is on the Medium CSR2 and the secondary System Manager server is on the Small CSR2.
- System Managers in a standalone and shared modes between the primary and secondary System Manager on Common servers. This includes allowing any combination of Avaya Aura® applications running with the primary and secondary System Manager instances.
- Servers from any combination of CSR1, CSR2, and CSR3 servers.
- Servers from both customer-provided virtualized environment and Appliance Virtualization Platform.

For example, the primary System Manager server can be on Appliance Virtualization Platform and the secondary System Manager server can be on a customer-provided virtualized environment.

The following are some key differences between Geographic Redundancy and High Availability (HA) solutions:

| Geographic Redundancy                  | HA                                                                                           |
|----------------------------------------|----------------------------------------------------------------------------------------------|
| Addresses sudden, site-wide disasters. | Addresses server outages due to network card, hard disk, electrical, or application failure. |
| Distributed across WAN.                | Deployed within a LAN.                                                                       |
| Manual                                 | Automated                                                                                    |

You must install System Manager on both the standalone servers with separate IP addresses and configure Geographic Redundancy. If a managed product that supports the Geographic Redundancy feature loses connectivity to the primary System Manager server, the secondary System Manager server provides the complete System Manager functionality. However, you must manually activate the secondary System Manager server.

 **Note:**

Only the system administrator can perform Geographic Redundancy-related operations.

You must reconfigure the elements that do not support Geographic Redundancy so that the elements can interact with the secondary System Manager server to receive configuration information. For more information about configuring elements that do not support Geographic Redundancy, see *Geographic Redundancy-unaware elements overview*.

During the installation of GR-unaware elements such as Presence Server, you must specify whether you want to enable the Geographic Redundancy feature on the element.

### Out of Band Management in a Geographic Redundancy setup

When you configure Geographic Redundancy, provide Management network details only. Validation fails if you configure Geographic Redundancy with Public network details. In Geographic Redundancy setup, you do not disable or enable Out of Band Management on both primary and secondary System Manager virtual machine. You can enable Out of Band Management on the primary System Manager virtual machine and disable Out of Band Management on the secondary System Manager virtual machine, and vice versa.

---

## Licensing in Geographic Redundancy

In Geographic Redundancy, the system replicates the license file on the secondary System Manager server that you installed on the primary System Manager server. When you activate the

secondary System Manager server, the same license file works on the secondary System Manager server.

In Geographic Redundancy, you must generate the license file by using the host ID of primary System Manager.

---

## Geographic Redundancy terminology

### **Primary System Manager server**

The first or the master System Manager server in a Geographic Redundancy setup that serves all system management requests.

### **Secondary System Manager server**

The System Manager server that functions as a backup to the primary System Manager server in a Geographic Redundancy setup. The secondary System Manager server provides the full System Manager functionality when the system fails to connect to the primary System Manager server.

### **Active System Manager server**

The mode of operation of the System Manager server where the server provides the full System Manager functionality.

### **Standby System Manager server**

The mode of operation of the System Manager server where the server serves only authentication and authorization requests. In the standby mode of operation, the system supports limited Geographic Redundancy configuration, the inventory service.

### **Standalone System Manager server**

The single System Manager server deployed in an enterprise that provides full System Manager functionality. The standalone server operates independently and does not contain a backup server.

### **Element**

An element is an instance of an Avaya Aura® network entity that the System Manager manages. For example, a Session Manager server or a Communication Manager server.

In the context of System Manager Geographic Redundancy, the elements can be classified as follows:

- **Geographic Redundancy-unaware element:** An element that does not support Geographic Redundancy, such as Avaya Aura® Session Manager Release 6.2.x and earlier. If you have a Geographic Redundancy-unaware element that is configured and managed by the primary System Manager server, and if the primary System Manager goes down or a Split brain scenario occurs, then you cannot use the secondary System Manager to manage the element either automatically or with a simple click of a button. If you need to manage a Geographic Redundancy-unaware element, then you need to make the changes manually. The manual changes differ from one Geographic Redundancy-unaware element to another.

- **Geographic Redundancy-aware element:** An element that supports Geographic Redundancy, such as Avaya Aura® Session Manager Release 6.3 and later. These elements can leverage the services of the primary or the secondary System Manager servers, either automatically or with the simple click of a button. The Geographic Redundancy-aware elements are classified in the following types:

- Elements capable of automatically switching between the primary and secondary System Manager servers depending on the state of the System Manager servers - If the primary System Manager server goes down or a Split brain scenario occurs and you activated the secondary System Manager server, then the element can detect it and depending on the current state of the System Manager server, the element automatically switches to the appropriate System Manager server, so that the element can be managed by it.

For example, if you have a System Manager 8.1.x Geographic Redundancy deployment, (Sunny Day) with a few Session Manager 8.1.x servers configured and you activated the secondary System Manager due to a network split, then each Session Manager server detects this. If the primary System Manager is not reachable, then the Session Manager server automatically switches to the active secondary System Manager server. If the primary System Manager server is reachable, then the element does not switch to the secondary System Manager, even though it is active. This does not mean that you cannot manage them. To manage the element through the secondary System Manager server, on secondary System Manager go to the Manage Elements page, select the element, and then click the **More Options > Force Manage** option.

- Elements that require manual switch - If the primary System Manager server goes down or a Split brain scenario occurs, and you need to manage the element from the secondary System Manager server, then on secondary System Manager go to the Manage Elements page, select the element, and then click the **More Options > Force Manage** option. This step is required to manage such elements from the secondary System Manager server.

### Geographic Redundancy-aware element

An element that supports Geographic Redundancy, such as Avaya Aura® Session Manager Release 6.3.

### Geographic Redundancy-unaware element

An element that does not support Geographic Redundancy, such as Avaya Aura® Session Manager release earlier than 6.3.

### Geographic Redundancy operational modes

- **The normal operation mode.** Also called the Sunny Day scenario. A System Manager Geographic Redundancy scenario where the primary System Manager server runs in the active mode while the secondary System Manager server runs in the standby mode providing limited set of services. In the normal operation mode, the primary System Manager server manages all elements and provides the complete System Manager functionality.
- **Primary nonoperational mode.** Also called the Rainy Day scenario. The primary System Manager server fails or loses connectivity to all elements that the system manages. The administrator activates the secondary System Manager server to make the secondary System Manager server manage all elements in the system.
- **Split network.** A System Manager Geographic Redundancy scenario when the primary and secondary System Manager servers run in the active mode but cannot communicate with each other due to a network connectivity outage or when some elements cannot

communicate with one System Manager and both primary and secondary System Manager servers can communicate with each other.

### Failover

Failover is the process of activating the secondary System Manager server when the primary System Manager server becomes nonoperational due to server outage or loses connectivity to the elements that the server manages.

### Failback

Failback is the process of making the primary System Manager server operational by restoring the primary System Manager server by using the primary or secondary System Manager data.

---

## Geographic Redundancy replication

The Geographic Redundancy feature provides the following replication mechanisms to ensure consistency of data between the primary and the secondary System Manager servers:

- Database replication
- File replication
- LDAP (Directory) replication

The primary System Manager server continuously replicates the data with the secondary System Manager server. If the system does not replicate the data for a specific period of time that is configured in **Services > Configurations > Settings > SMGR > HealthMonitor**, the primary and the secondary System Manager servers raise alarms.

---

## Prerequisites for the Geographic Redundancy setup

In a Geographic Redundancy setup, the two standalone System Manager servers that you designate as primary and secondary servers must meet the following requirements:

- Contain the same version of the software that includes software packs.
- Contain the same profile for primary and secondary System Manager Geographic Redundancy virtual machines. For example, if the primary System Manager contains Profile 2, the secondary System Manager must also contain Profile 2.
- Contain the same version of the System Manager software that includes service pack and software patches.
- Contain the same parent domain names for two System Manager systems. For example, smgr.abc.com and smgr.xyz.com are invalid domain names because the parent domain names abc and xyz are different.
- Communicate with each other over the network by using the IP address and FQDN.

- In the Geographic Redundancy setup, the primary and secondary System Manager must use the same VFQDN.
- Have a synchronized network time.
- Use DNS to ensure that the name resolution is automatic. Otherwise, you must resolve the IP address and the host name in the `/etc/hosts` file on the primary and secondary System Manager servers.
- Have open required ports to support the Geographic Redundancy feature. For port usage information, see *Avaya Port Matrix: Avaya Aura® System Manager* on the Avaya Support website at <http://support.avaya.com/>.
- Have T1 as the minimum data pipe between the primary and the secondary System Manager server. T1 provides 1.544 Mbps.
- Have network latency that is less than 500 ms.
- In the Geographic Redundancy setup, if you need to configure the outbound firewall rules, then you need to add the peer IP addresses on the primary and secondary System Manager servers.

## Hardware resource and parameter for the Geographic Redundancy setup

| # | Hardware Resource or Parameter    | Similar on Primary and Secondary? (Mandatory or Recommended) | Does System Manager take care? | Notes                                                                                                                                                                        |
|---|-----------------------------------|--------------------------------------------------------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | 64 bit architecture               | Mandatory                                                    | No                             | Require 64 bit system for both servers.<br><br>Require x86_64 architecture to support System Manager provided operating system and then for the Geographic Redundancy setup. |
| 2 | Byte Order (Big or Little endian) | Mandatory                                                    | Yes                            | This depends on CPU architecture.                                                                                                                                            |
| 3 | 64 bit OS                         | Mandatory                                                    | Yes                            | -                                                                                                                                                                            |
| 4 | PostgreSQL major version          | Mandatory                                                    | Yes                            | -                                                                                                                                                                            |
| 5 | PostgreSQL minor version          | Recommended                                                  | Yes                            | -                                                                                                                                                                            |

Table continues...

| #  | Hardware Resource or Parameter | Similar on Primary and Secondary? (Mandatory or Recommended) | Does System Manager take care? | Notes                                                                                                                                                                                                                                          |

# Key tasks for Geographic Redundancy

## Prerequisites

Ensure that the two System Manager servers meet the requirements that are defined in Prerequisites for servers in the Geographic Redundancy setup.

## Key tasks

Only the system administrator can perform Geographic Redundancy-related operations.

- Configure Geographic Redundancy.

Configure Geographic Redundancy to handle the situation when the primary System Manager server fails or when the managed element loses connectivity to the primary System Manager server.

### Important:

During the configuration of Geographic Redundancy, the primary System Manager replicates the data between the primary and the secondary System Manager servers. Therefore, ensure that the system maintenance activities such as backup, restore, and shutdown are not in progress.

- Enable the Geographic Redundancy replication between the two servers.

Enable the replication in the following scenarios:

- After you configure the two standalone System Manager servers for Geographic Redundancy, you must enable the Geographic Redundancy replication between the two servers to ensure that the secondary System Manager server contains the latest copy of the data from the primary System Manager server.
- During the system maintenance or upgrades, Geographic Redundancy replication must be disabled. After maintenance activity is complete, you must enable Geographic Redundancy replication if it was manually or automatically disabled due to the maintenance activity.

### Note:

If the heartbeat between the two System Manager servers in which the Geographic Redundancy replication is enabled stops due to network connectivity failure or the server failure, the system automatically disables the Geographic Redundancy replication within a preconfigured time. The default is 5 minutes. If the primary and secondary System Manager servers are running and if the network connectivity between the two servers fails, the system triggers auto-disable on both servers. If one of the two servers becomes nonoperational, the system triggers auto-disable on the server that is operational.

- After the primary System Manager server recovers from failure.

### Important:

During the bulk activities such as import, export, and full synchronization of Communication Manager, the system might disable the Geographic Redundancy replication for reasons, such as the size of the data involved in the bulk activity and the bandwidth between the primary and the secondary System Manager server. After you

complete the bulk activity, enable the Geographic Redundancy replication if the replication is disabled.

- Disable the Geographic Redundancy replication between the two servers.

Disable the Geographic Redundancy replication before you start the maintenance activities such as upgrades, installation of software patches or hot fixes. If the primary and the secondary System Manager servers disconnect from each other for more than the threshold period, the system automatically disables the Geographic Redundancy replication. The default threshold period is 5 minutes.

- Activate the secondary System Manager server.

Activate the secondary System Manager server in the following scenarios:

- The primary System Manager becomes nonoperational.
- The enterprise network splits.

- Deactivate the secondary System Manager server.

Deactivate the secondary System Manager server in the following situations:

- The primary System Manager server becomes available.
- The element network restores from the split.

- Restore the primary System Manager server.

After you activate the secondary System Manager server, to return to the active-standby mode, you must restore the primary System Manager server. You can choose to restore from the primary System Manager or the secondary System Manager server.

 **Note:**

The system does not merge the data from the primary and secondary server.

- Reconfigure Geographic Redundancy.

You can reconfigure Geographic Redundancy when the secondary System Manager is in the standby mode or active mode. The reconfiguration process copies the data from the primary System Manager server to the secondary System Manager server.

- Convert the primary System Manager server to the standalone server.

Perform this procedure to convert the primary System Manager server in the Geographic Redundancy-enabled system to a standalone server or if you have to configure a new secondary server.

For detailed instructions to complete each task, see the appropriate section in this document.

# Prerequisites before configuring Geographic Redundancy

## Geographic Redundancy prerequisites overview

Before enabling and configuring Geographic Redundancy, do the following:

1. Configure CRL download on the secondary System Manager server.

 **Note:**

By default, CRL is valid only for 7 days. Therefore, you must configure Geographic Redundancy before the expiry date of CRL.

2. Add the trusted certificate of primary server to the secondary System Manager server.
3. If certificate is replaced on Primary Server by third-party signed certificate then same certificate type must be replaced on Secondary Server by same third-party CA.  
  
For example: If *Management Container TLS Service* is replaced by third-party CA signed certificate on Primary Server then same type certificate must be replaced on Secondary Server by same third-party CA.
4. Install third-party certificate on both servers prior to Geographic Redundancy configuration and post Geographic Redundancy configuration.  
  
For more information, see “Managing certificates”.
5. Ensure that third-party CA certificate is added into trust store of both System Manager.
6. Replaced certificate must have full chain (id certificate ->inter CA (if present) certificate -> root CA certificate) and also must contain correct FQDN/VFQDN in required places.
7. Configure CRL download is mandatory for Geographic Redundancy.
8. If CRL URL for third-party is not accessible from System Manager, then set **Certificate Revocation Validation** from **BEST\_EFFORT** to **NONE** on the **Security > Configuration > Security Configuration > Revocation Configuration** page.

JBoss service automatically restarts after 10 minutes.

[Adding the trusted certificate of primary server to the secondary System Manager server](#) on page 108

---

## Copying the CRL URL

### Procedure

1. On the web browser, type `https://<Fully Qualified Domain Name>/SMGR`, the System Manager URL.
2. On the address bar, click the Lock icon.
3. Click **View certificates**.
4. On the Certificate dialog box, do the following:
  - a. Click on the **Details** tab.
  - b. Scroll down and click the **CRL Distribution Points** field.

The system displays the CRL URL in the text box.

For example: `http://<vFQDN>/ejbca/publicweb/webdist/certdist?cmd=crl&issuer=CN=System%20Manager%20CA,OU=MGMT,O=AVAYA`

- c. Press **Ctrl+C** and copy the URL in Notepad for configuring CRL download in the Geographic Redundancy set up.
- d. Click **OK**.

## Configuring CRL download on the secondary System Manager server

### Procedure

1. Access the login page of the primary System Manager server.
2. Copy the CRL of the browser certificate.

For information about copying the CRL URL, see “Copying the CRL URL.”

3. Replace the vFQDN in the CRL with the IP address of the primary System Manager server.

For example, the CRL in the certificate is:

```
http://<vFQDN>/ejbca/publicweb/webdist/certdist?cmd=crl&issuer=CN=System%20Manager%20CA,OU=MGMT,O=AVAYA
```

The new CRL for the certificate will be:

```
http://<ip-address>/ejbca/publicweb/webdist/certdist?cmd=crl&issuer=CN=System%20Manager%20CA,OU=MGMT,O=AVAYA
```

Where, <vFQDN> and <ip-address> are the respective vFQDN and IP address.

 **Note:**

If you installed a third-party certificate on System Manager servers, this step is not required. If third-party certificate, then configure CRL URL of the third-party certificate for CRL download.

4. Log on to the secondary System Manager web console.
5. On the System Manager web console, click **Services > Security**.
6. In the navigation pane, click **Configuration > CRL Download**.
7. On the CRL Download Configuration page, click **Add**.

The system displays the Schedule CRL Download page.

8. In **Job Name**, type the job name.
9. In **Job Frequency**, set the frequency and recurrence to schedule the job within a few minutes after the CRL addition.

For more information, see Schedule CRL Download field descriptions.

10. Copy the new CRL URL from Notepad and paste the URL in the **Configure CRL Distribution Point** field.

For information about copying the CRL URL, see “Copying the CRL URL.”

CRL URL example:

```
http://<ip-address>/ejbca/publicweb/webdist/certdist?cmd=crl&issuer=CN=System%20Manager%20CA,OU=MGMT,O=AVAYA
```

11. Click **Add**, and then click **Commit**.

Ensure that the job is completed successfully.

## Next steps

Add the trusted certificate of primary server to the secondary System Manager server.

---

# Adding the trusted certificate of primary server to the secondary System Manager server

## Procedure

1. Log in to the primary System Manager web console.

2. On the System Manager web console, click **Services > Security**.
3. In the navigation pane, click **Certificates > Authority**.
4. Click **CA Functions > CA Structure & CRLs**.
5. Click **Download PEM file**.
6. Log in to the secondary System Manager web console.
7. On the System Manager web console, click **Services > Inventory**.
8. In the navigation pane, click **Manage Elements**.
9. On the Manage Elements page, select the System Manager certificate and click **More Actions > Manage Trusted Certificates**.
10. On the Manage Trusted Certificates page, click **Add**.
11. Click **Choose File** and select the previously downloaded PEM file.
12. Click **Retrieve Certificate**, and then click **Commit**.

---

## Configuring Geographic Redundancy

### Before you begin

- For the new installation of System Manager, ensure that you change the default password for the system administrator user.
- Ensure that you change CLI passwords on primary and secondary System Manager servers.  
60 days after the System Manager CLI password expires, Geographic Redundancy becomes nonoperational. You must set a new password on primary and secondary System Manager servers for Geographic Redundancy to become operational again.
- Ensure that the two System Manager servers meet the requirements that are defined in Prerequisites for servers in the Geographic Redundancy setup.

### About this task

For resiliency, from the pair of standalone System Manager servers, you can configure Geographic Redundancy.

#### Important:

- During the configuration of Geographic Redundancy, the primary System Manager replicates the data between the primary and the secondary System Manager servers. Therefore, ensure that the system maintenance activities such as backup, restore, and shutdown are not in progress.
- After the Geographic Redundancy configuration is complete, the credentials used for logging in to the secondary System Manager becomes identical to the login credentials of the primary System Manager.

## Procedure

1. Log on to the System Manager web console of the standalone server that you require to designate as the secondary server and perform the following:

- a. On the System Manager web console, click **Services > Geographic Redundancy**.
- b. Click **Configure**.
- c. In the dialog box, provide the details of the primary System Manager server in the following fields:

- **Primary Server Username**

Enter the system administrator user name that you use to log on to the primary System Manager server.

- **Primary Server Password**

Enter the system administrator password that you use to log on to the primary System Manager server.

- **Primary Server IP**

- **Primary Server FQDN**

- d. Click **OK**.

The configuration process takes about 30 minutes. However, the duration might vary depending on the size of the data on the primary System Manager server.

 **Note:**

Because the server becomes unavailable, you cannot gain access to the web console. Wait until the process is complete before you continue with the next step.

The server that you configured becomes the secondary server and the other standalone server becomes the primary System Manager server.

2. To view the status of the Geographic Redundancy configuration during the restart of the two application servers, perform one of the following:

- Log on to the web console of the primary System Manager server and perform the following:
  - a. On the System Manager web console, click **Services > Geographic Redundancy**.
  - b. Refresh the GR Health page.

If **Enable** is available, the configuration is complete.

 **Note:**

Log off and log on to the primary System Manager server to view the updated status of Geographic Redundancy health.

- Log in to the secondary System Manager server as system administrator by using the command line interface and perform the following:

a. Type `tail -f /home/ucmdeploy/quantum/autoReconfig.log`.

The system displays the progress during the restart of the two application servers. When the second application server restart completes, the system displays the following messages:

```
SMGR :: operationStatus=success

SMGR :: Quantum has been successfully
configured as a secondary.
```

### Next steps

On the web console of the primary System Manager server, enable the Geographic Redundancy replication.

---

## Enabling the Geographic Redundancy replication

Enable the Geographic Redundancy replication between the two servers to ensure that the data gets continuously replicated between the primary and secondary System Manager servers.

### Before you begin

- Log on to the System Manager web console of the primary server.
- Ensure that CLI passwords on primary and secondary System Manager servers do not expire.

60 days after the System Manager CLI password expires, Geographic Redundancy becomes nonoperational. You must set a new password on primary and secondary System Manager servers for Geographic Redundancy to become operational again.

### About this task

#### Important:

During the configuration of Geographic Redundancy, the primary System Manager replicates the data between the primary and the secondary System Manager servers. Therefore, ensure that the system maintenance activities such as backup, restore, and shutdown are not in progress.

### Procedure

1. On the System Manager web console, click **Services > Geographic Redundancy**.
2. Click **Enable Replication**.

The system displays the progress information in the **Enable GR Status** section.

 **Note:**

Because the server becomes unavailable, you cannot gain access to the web console. Wait until the process is complete before you continue with the next step.

If the enabling process is successful, the system displays the Geographic Redundancy replication status as `Enabled`. If the process fails, the system displays an error message with the replication status as `Failed` on the primary the System Manager web console. The primary server remains in the failed state while the secondary server rolls back to the previous state. Verify if the system has raised an alarm for a temporary network connectivity failure. Retry when the network connectivity is restored. If the problem persists, contact Avaya service personnel.

## Disabling the Geographic Redundancy replication

### Before you begin

Log on to the System Manager web console of the primary server.

### Procedure

1. On the System Manager web console, click **Services > Geographic Redundancy**.
2. Click **Disable Replication**.
3. In the dialog box, click **Yes**.

The system displays the progress information in the **Disable GR Status** section.

If the disabling process is successful, the system displays the Geographic Redundancy replication status as `Disabled`. The system stops replicating the data from the primary and secondary System Manager server. If the disabling process fails, the system displays an error message on the web console of the primary System Manager.

## Activating the secondary System Manager server

### About this task

- When you activate the secondary System Manager server, the system stops replicating the data from the primary System Manager server to the secondary System Manager server. During activation, you cannot gain access to the web console of the secondary System Manager server for some time.
- In the same browser instance, do not open the primary and secondary System Manager server in different tabs. The system might display an unknown error after the activation, deactivation, or recovery is complete. You can ignore this error message.

### Before you begin

Log on to the System Manager web console of the secondary server.

### Procedure

1. On the System Manager web console, click **Services > Geographic Redundancy > GR Health**.
2. Click **Activate Secondary Server**.

The system displays the Geographic Redundancy (GR) Health Current status dialog box.

3. In the Select the reason for activation, choose one of the following options:
  - **Primary Down:** When the primary System Manager server becomes nonoperational, the server hardware is faulty and unusable, or the application server fails to recover.
  - **Network Split:** When the enterprise network splits and servers fail to communicate with each other.
  - **Maintenance:** When the maintenance activities such as backup, restore, upgrade, and shutdown are in progress.
  - **Other:** Any other reason where the primary System Manager server becomes unusable and needs the secondary System Manager server to become operational.

4. Click **Yes**.

The system displays the initialization of the activation process.

5. Click **Yes**.

The activation process takes about 15–20 minutes to complete.

If the activation process fails, the system displays an error message on the secondary System Manager web console and rolls back to the previous state. If the activation process

is successful, the secondary System Manager server changes to the active mode and provides complete System Manager functionality.

Because the server becomes unavailable, you cannot gain access to the web console. Wait until the process is complete before you continue with the next step.

---

## Deactivating the secondary System Manager server

### Before you begin

Log on to the System Manager web console of the secondary server.

### Procedure

1. On the System Manager web console, click **Services > Geographic Redundancy > GR Health**.
2. Click **Deactivate Secondary Server**.

The system displays the Deactivate Secondary Server dialog box and the progress while performing the deactivation process.

3. Click **OK**.

If the deactivation process is complete, the secondary System Manager server goes to the standby mode. If the deactivation process fails, the system displays an error message on the secondary System Manager web console and the server remains in the active mode.

### Next steps

Restore primary System Manager. For information, see “Restoring the primary System Manager server”.

# Restoring the primary System Manager server

## Before you begin

Log on to the System Manager web console of the primary server.

## About this task

You can restore the data when the secondary System Manager server is active or in the standby mode. However, for minimum system nonfunctional time during data restoration or an emergency or both, you can restore the data when the secondary System Manager server is active.

### Important:

After you restore the system with the secondary System Manager data, if you want to revert to the primary System Manager data, you can restore to the primary System Manager data using the procedure in Step 4. However, you must restore to the primary System Manager data, before you enable the Geographic Redundancy replication. After you enable the Geographic Redundancy replication, you cannot restore to the primary System Manager server data.

## Procedure

1. On the System Manager web console, click **Services > Geographic Redundancy**.
2. Click **Restore Data**.
3. On the Restore GR dialog box, select a server whose data you want to retain:

- **Primary Server**

The system keeps the primary System Manager server data. The data on the secondary System Manager server is lost.

Select the secondary System Manager server if the secondary System Manager server data changes significantly during the interval between activation and deactivation and the administrator wants to retain those changes even after restoring the data using **Restore Data**.

- **Secondary Server**

The system restores the data from the secondary server on the primary System Manager server. the System Manager web console is unavailable for some time. The time that the system takes to restore depends on the network speed and the size of the data that the system must restore.

After the system recovery, select the secondary System Manager server if the secondary System Manager server data changes significantly during the interval between the system recovery and the deactivation and if you want to retain the changes from the secondary System Manager server after restoring the data by using **Restore Data**.

The system displays the Restore Status dialog box.

The system displays the restore operation status and the status of the primary and the secondary System Manager server.

**! Important:**

After you restore the data, all changes that you make on the secondary System Manager server that is active will not be available on the primary System Manager server.

4. If you later decide to revert to the database of the primary System Manager server, perform the following steps after the restore is complete:
  - a. Using the command line interface, log in to System Manager of the primary server with administrator privilege CLI user credentials.
  - b. Change to the `$MGMT_HOME/geo/bin` directory.
  - c. Type `sh backupandrestore.sh recovery secondaryIP secondaryFQDN`.

When the script completes, System Manager restarts and contains the data from the primary System Manager server that was available before you restored with the secondary System Manager data.

**\* Note:**

- To restore with the secondary System Manager server data again, activate and deactivate the secondary System Manager server.
- Because the server becomes unavailable, you cannot gain access to the web console. Wait until the process is complete before you continue with the next step.

## Next steps

Verify the data and deactivate the secondary System Manager server if the server is active during the restoration process.

Enable the Geographic Redundancy replication to synchronize the primary and secondary System Manager servers.

# Reconfiguring Geographic Redundancy

## Before you begin

- Ensure that the two System Manager servers meet the requirements that are defined in Prerequisites for servers in the Geographic Redundancy setup.
- Log on to System Manager web console of the secondary server.

## About this task

For resiliency, from the pair of standalone System Manager servers, you can configure Geographic Redundancy.

### Important:

During the configuration of Geographic Redundancy, the primary System Manager replicates the data between the primary and the secondary System Manager servers. Therefore, ensure that the system maintenance activities such as backup, restore, and shutdown are not in progress.

## Procedure

1. On the System Manager web console, click **Services > Geographic Redundancy**.
2. Click **Reconfigure**.
3. In the dialog box, provide the details of the primary System Manager server in the following fields:

- **Primary Server Username**

Enter the admin user name that you use to log on to the primary System Manager Web console.

- **Primary Server Password**

Enter the admin password that you use to log on to the primary System Manager Web console.

- **Primary Server IP**

- **Primary Server FQDN**

4. Click **OK**.

 **Note:**

Because the server becomes unavailable, you cannot gain access to the web console. Wait until the process is complete before you continue with the next step.

The server that you configured becomes the secondary server and the other standalone server becomes the primary System Manager server.

5. To view the status of the Geographic Redundancy configuration during the restart of the two application servers, perform one of the following:

- Log on to the web console of the primary System Manager server and perform the following:
  - a. On the System Manager web console, click **Services > Geographic Redundancy**.
  - b. Refresh the GR Health page.

If **Enable** is available, the configuration is complete.

 **Note:**

Log off and log on to the primary System Manager server to view the updated status of Geographic Redundancy health.

- Log in to the secondary System Manager server as system administrator by using the command line interface and perform the following:

- a. Type `tail -f /home/ucmdeploy/quantum/autoReconfig.log`.

The system displays the progress during the restart of the two application servers. When the second application server restart completes, the system displays the following messages:

```
SMGR :: operationStatus=success

SMGR :: Quantum has been successfully
configured as a secondary.
```

## Next steps

On the primary the System Manager Web console, enable the Geographic Redundancy replication.

---

## Converting the primary System Manager server to the standalone server

### Before you begin

- Log on to the System Manager web console of the primary server.
- Disable the Geographic Redundancy replication if you have not already disabled.

### Note:

You can also reconfigure secondary System Manager to the standalone server by performing the same steps.

### Procedure

1. On the System Manager web console, click **Services > Geographic Redundancy**.
2. Select the primary System Manager server, and click **Convert To Standalone**.

The system displays a dialog box.

3. Click **OK**.

If the conversion is successful, the system displays `Converted to Standalone successfully` and converts the primary System Manager server to a standalone server.

The system displays the status of the server as `Unconfigured` on the Manage Elements page. The administrator can configure the server when required.

## About the Health Monitoring service

Using the Health Monitoring service, you can monitor the status of the following:

- Database replication
- File replication
- LDAP replication
- System health check
- Application server

The system checks the condition of services on both the primary and secondary System Manager servers.

You can configure the following parameters from **Services > Configurations > Settings > SMGR > HealthMonitor** of the System Manager web console:

- Health monitoring interval
- The number of days the health monitoring data must be retained
- The number of successive retries before an alarm is raised

You can configure the timeout interval for health monitoring in the `MonitorConfig.properties` file from System Manager CLI. The properties file is available in the `$MGMT_HOME/SystemMonitor/res/` location. The default timeout interval is 15 seconds.

The health monitoring includes the overall status of the replication, and the detailed health metric such as the time and size of the data that the secondary System Manager server lags in replication behind the primary System Manager server.

You can view the heartbeat status and the health monitoring details in the graphical format for different services from **View Heartbeat Status** from **Services > Geographic Redundancy > GR Health** on System Manager web console.

---

## Configuring the timeout interval for health monitoring

### Procedure

1. Log in to System Manager CLI.
2. From the `$MGMT_HOME/SystemMonitor/res` location, open the `MonitorConfig.properties` file.
3. In the properties file, change the value for the `ServiceTimeOutInterval` property.  
The default is 15 seconds.
4. To restart the service, type `service systemMonitor restart`.  
The changes take effect.

---

## Geographic Redundancy field descriptions

The Geographic Redundancy and the GR Health pages remain blank on a standalone server or until you configure a secondary System Manager.

## Primary Server Details

The system displays the IP address and the FQDN of the primary System Manager server.

| Name                         | Description                                                                                                                                |

| <b>Service Name</b>                   | <p>The name of the monitored service. The services are:</p> <ul style="list-style-type: none"> <li><b>System Health:</b> The heartbeat status indicates if the primary or the secondary System Manager server can communicate with the peer System Manager server over the network.</li> <li><b>Database Replication:</b> The heartbeat status indicates if the data stored in the System Manager database is getting replicated between the primary and the secondary System Manager server.</li> <li><b>Application System Health:</b> The heartbeat status indicates if the application server of primary or secondary System Manager can query the application server of the peer System Manager.</li> <li><b>File Replication:</b> The heartbeat status indicates if the configuration files are getting replicated between the primary and the secondary System Manager server.</li> <li><b>Directory Replication:</b> The heartbeat status indicates if the data stored in the internal LDAP server is getting replicated in the respective System Manager server.</li> </ul> |
| <b>Last Successful Heartbeat Time</b> | The last time the heartbeat was successful for the monitored service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Last Missed Heartbeat Time</b>     | The last time when the monitored service missed the heartbeat.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>View Details</b>                   | <p>The <b>View Graph</b> link to view the health status of the monitored service over a period of time. To configure the time period, click <b>Edit Dates</b>. The graph displays the status in 0 and 1.</p> <ul style="list-style-type: none"> <li>0 indicates that the monitored service is either stopped or failed at that point of time</li> <li>1 indicates that the monitored service is running at that point of time.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Prerequisites for configuring disaster recovery

---

### Disaster recovery prerequisites

To configure the disaster recovery for the primary System Manager server:

1. Set up a new primary System Manager server.
2. Configure CRL download on the primary System Manager server.

 **Note:**

By default, CRL is valid only for 7 days. Therefore, you must configure disaster recovery before the expiry date of CRL.

3. Add the trusted certificate of the secondary System Manager server to the new primary System Manager server.
4. If certificate is replaced on Primary Server by third-party signed certificate then same certificate type must be replaced on Secondary Server by same third-party CA.  
  
For example: If *Management Container TLS Service* is replaced by third-party CA signed certificate on Primary Server then same type certificate must be replaced on Secondary Server by same third-party CA.
5. Install third-party certificate on both servers prior to Geographic Redundancy configuration and post Geographic Redundancy configuration.  
  
For more information, see “Managing certificates”.
6. Ensure that third-party CA certificate is added into trust store of both System Manager.
7. Replaced certificate must have full chain (id certificate ->inter CA (if present) certificate -> root CA certificate) and also must contain correct FQDN/VFQDN in required places.
8. Configure CRL download is mandatory for Geographic Redundancy.
9. If CRL URL for third-party is not accessible from System Manager, then set **Certificate Revocation Validation** from **BEST\_EFFORT** to **NONE** on the **Security > Configuration > Security Configuration > Revocation Configuration** page.

JBoss service automatically restarts after 10 minutes.

---

## Configuring CRL download on the primary System Manager server

### Procedure

1. Access the login page of the secondary System Manager server.
2. Copy the CRL of the browser certificate.

For information about copying the CRL URL, see “Copying the CRL URL.”

3. Replace the vFQDN in the CRL with the IP address of the secondary System Manager server.

For example, the CRL in the certificate is:

```
http://<vFQDN>/ejbca/publicweb/webdist/certdist?cmd=crl&issuer=CN=System%20Manager%20CA,OU=MGMT,O=AVAYA
```

The new CRL for the certificate will be:

```
http://<ip-address>/ejbca/publicweb/webdist/certdist?cmd=crl&issuer=CN=System%20Manager%20CA,OU=MGMT,O=AVAYA
```

Replace the <vFQDN> and <ip-address> tags with the respective vFQDN and IP address.

 **Note:**

If you installed a third-party certificate on System Manager servers, this step is not required. If third-party certificate, then configure CRL URL of the third-party certificate for CRL download.

4. Log on to the primary System Manager web console.
5. On the System Manager web console, click **Services > Security**.
6. In the navigation pane, click **Configuration > CRL Download**.
7. On the CRL Download Configuration page, click **Add**.

The system displays the Schedule CRL Download page.

8. In **Job Name**, type the job name.
9. In **Job Frequency**, set the frequency, and recurrence to schedule the job within a few minutes after the CRL addition.

For more information, see Schedule CRL Download field descriptions.

10. In **Configure CRL Distribution Point**, type the new CRL.
11. Click **Add**, and then click **Commit**.

Ensure that the job is completed successfully.

### Next steps

Add the trusted certificate of the secondary System Manager server to the new primary System Manager server.

## Adding the trusted certificate of secondary server to the primary System Manager server

### Procedure

1. Log in to the secondary System Manager web console.
2. On the System Manager web console, click **Services > Security**.
3. In the navigation pane, click **Certificates > Authority**.

4. Click **CA Functions > CA Structure & CRLs**.
5. Click **Download PEM file**.
6. Log in to the primary System Manager web console.
7. On the System Manager web console, click **Services > Inventory**.
8. In the navigation pane, click **Manage Elements**.
9. On the Manage Elements page, select the System Manager certificate and click **More Actions > Manage Trusted Certificates**.
10. On the Manage Trusted Certificates page, click **Add**.
11. Click **Choose File** and select the previously downloaded PEM file from the secondary server.
12. Click **Retrieve Certificate**, and then click **Commit**.

---

## Replacing System Manager servers

---

### Replacement of System Manager servers

From the pair of System Manager servers that are configured with Geographic Redundancy, you might have to replace the primary System Manager server with a new primary System Manager server or move existing primary System Manager server to a different location. The following sections list the scenarios when you must replace the primary System Manager server and the key tasks involved in the replacement procedure.

---

### Moving the existing primary System Manager server to a different location

#### Procedure

1. Disable the Geographic Redundancy replication.
2. Shut down the System Manager server, and relocate the server to a new location.
3. **(Optional)** Activate the secondary System Manager server.

You activate the secondary server to ensure zero down time. If you do not activate the secondary server, do not perform Step 7 and Step 8.
4. Start the primary System Manager server.
5. If the primary System Manager server uses a different IP or FQDN or both, change the IP address, FQDN, or both on the primary System Manager server.

For instructions to change the IP address or FQDN, see [Changing the IP address and FQDN in System Manager](#).

6. Connect the primary System Manager server to the network.
7. Deactivate the secondary System Manager server if you already activated in Step 3.
8. Restore the data.
9. Enable the Geographic Redundancy replication.

## Restoring the primary System Manager server using the old primary server backup data

### About this task

When the primary System Manager server or the site fails, you can restore the primary System Manager server using the backup data from the old primary server.

### Procedure

1. **(Optional)** Activate the secondary System Manager server.  
Activate the secondary server to ensure zero down time. If you do not activate the secondary server, do not perform Step 6 and Step 7.
2. On the new server, install the System Manager template that you later designate as primary server by using the cold standby procedure.  
For information about how to change over to the cold standby server, see *Upgrading Avaya Aura® System Manager*.
3. If you must to use a different IP address or FQDN or both on the new primary System Manager server, change the IP address, FQDN, or both on the primary System Manager server. For more information, see [Changing the IP address and FQDN in System Manager](#).
4. Connect the primary System Manager server to the network if not already connected to the network.
5. Deactivate the secondary System Manager server.
6. Restore the data.
7. Enable the Geographic Redundancy replication if not already enabled.

---

## Restoring the primary System Manager server using the data on the secondary System Manager server

When the primary System Manager server or the site fails, you can restore the primary System Manager server using the data on the secondary System Manager server.

### Procedure

1. Activate the secondary System Manager server if you have not already activated.
2. Create a backup of the secondary System Manager server.
3. On the new server, install the System Manager template and perform the following steps:
  - a. Log on to the System Manager web console of the standalone server that you installed, and change the admin password.  
Ensure that the server meets the requirements for the Geographic Redundancy setup.
  - b. Recover System Manager from disaster.
4. Deactivate the secondary System Manager server.
5. Restore the data.
6. Enable the Geographic Redundancy replication.

## Replacing the secondary System Manager server on the site

### About this task

From the pair of System Manager servers that are configured with Geographic Redundancy, you might have to replace the secondary System Manager server with a new secondary System

Manager server or move existing secondary System Manager server to a different location. The reasons might be the following:

- Secondary System Manager failure
- Site failure
- Movement of the secondary to a different location.

## Procedure

1. Create a backup of the primary System Manager server.
2. On System Manager web console, click **Services > Replication** and verify that the system synchronized all elements to the primary System Manager server the data replication is working.
3. On the new server, install the System Manager template. For instructions, see *Implementing Avaya Aura® System Manager*.
4. Convert the primary System Manager server to standalone server.
5. On System Manager web console, click **Services > Replication** and verify that the system synchronized all elements to the primary System Manager server the data replication is working.
6. Log on to System Manager web console of the standalone System Manager server that you installed and change the password.
7. Configure Geographic Redundancy.
8. Enable the Geographic Redundancy replication if you have not already enabled.

---

## Recovering the primary System Manager server from disaster

Perform the system recovery process when the primary System Manager server becomes unavailable and when you do not have a backup to restore on the new System Manager server.

### About this task

#### Important:

During the system recovery of Geographic Redundancy, the active secondary System Manager server copies the data from the secondary System Manager server to the primary System Manager server. Therefore, ensure that the system maintenance activities, such as, backup, restore, and shutdown are not in progress.

### Before you begin

- For fresh installation of System Manager, change the default password for the system administrator user.

- Ensure that the two System Manager servers meet the requirements that are defined in Prerequisites for servers in the Geographic Redundancy setup.

## Procedure

1. Activate the secondary System Manager server.
2. Create a backup of the secondary System Manager server.
3. View and verify the virtual FQDN that is configured on the secondary System Manager server by using one of the following:
  - From the virtual FQDN configured in the System Manager certificate, do one of the following:
    - On Firefox, click the  icon on the address bar of the browser. Click **More Information > View Certificate > Details**. In the **Certificate Details** area, click **Certificate > Extensions > Certificate Subject Alt Name**. The system displays two values for **DNS Name**. The first entry is the virtual FQDN.
    - On Internet Explorer, click **Certificate Error** next to the address bar and click **View Certificates > Details > Subject Alternative Name**. The first entry for **DNS Name** is the virtual FQDN.
  - From the command line interface, log in to the secondary System Manager server, and check the virtualFQDN property value in the `$MGMT_HOME/infra/conf/smgr-properties.properties` file.
4. On the new server, install the System Manager template that you later designate as primary server with the same virtual FQDN that you obtained in Step 3.
5. Log on to the web console of the new System Manager server to change the default password.
6. For Release 7.1 and later, perform the steps provided in the “Disaster recovery prerequisites” section.
7. Log in to the command line interface of the newly created primary System Manager with administrator privilege CLI user credentials, and perform the following:
  - a. Perform one of the following:
    - For Releases 6.3.1 and 6.3.0, type `sh $MGMT_HOME/geo/bin/rundisasterrecovery.sh <peer fqdn> <peer ip> <peerNodesmgrUserId> <peerNodesmgrPassword>`.
    - For Release 6.3.2 and later, type `sh $MGMT_HOME/geo/bin/rundisasterrecovery.sh -FQDN <secondary fqdn> -IP <secondary IP> -ID <secondary System Manager web console system admin user name> -PASS <secondary System Manager web console system admin password>`.
    - For Release 7.1 and later, type `sudo -u admin $MGMT_HOME/geo/bin/rundisasterrecovery.sh -FQDN <SECONDARY_HOST_NAME> -IP <Secondary_Host_IPAddress> -ID admin -PASS <UIPassword>`

Release 6.3.x example: `$MGMT_HOME/geo/bin/rundisasterrecovery.sh -FQDN psvdbf24.dr.sdr.com -IP 144.235.244.244 -ID systemadmin -PASS System$567.`

Release 7.1.x example: `sudo -u admin $MGMT_HOME/geo/bin/rundisasterrecovery.sh -FQDN sit2.smgrdev.avaya.com -IP 2a07:2a42:adc0:1d::87 -ID admin -PASS System$675`

The recovery process starts and takes about 40 minutes. The command runs in the background and the system creates nohup logs in the directory from where you run the `rundisasterrecovery.sh` command, which you can tail.

b. Type one of the following:

- `tail -f $AVAYA_LOG/mgmt/geo/disasterRecoveryScript.log`
- `tail -f nohup.out`

8. To quit the `tail` command, press `Control+C`.

When the recovery process is complete, the system displays the message `Disaster Recovery has completed JBoss will be restarted`, may take up to 15 minutes. The system configures System Manager servers as a Geographic Redundancy pair with the secondary data on the primary System Manager server.

9. Deactivate the secondary System Manager server.
10. Restore the data from the primary System Manager server.
11. Enable the Geographic Redundancy replication.

The system starts working in the normal operational mode.

## Configuring the GR-unaware elements to work with System Manager

---

### Geographic Redundancy-unaware elements overview

Geographic Redundancy-unaware (GR-unaware) elements are elements that cannot support the System Manager Geographic Redundancy feature. GR-unaware elements might be legacy

elements, that is, prior to Release 6.3, which are already present in the field or elements that have not yet leveraged the Geographic Redundancy feature.

You must manually activate the secondary System Manager server to manage the elements when:

- The primary System Manager server fails.
- The network fails to isolate one of the System Manager systems or one or more adopter elements or both.

This scenario is called the primary nonoperational scenario or rainy day scenario.

This document provides the procedures required in a primary nonoperational scenario to reconfigure the GR-unaware elements in the system. After the reconfiguration is complete, the elements can communicate with the secondary System Manager server to receive management or configuration information. This document also describes the functioning of GR-unaware elements with System Manager in general and the secondary System Manager server in particular.

**\* Note:**

The system does not replicate the `/etc/hosts` file of the primary System Manager server to the secondary System Manager server. If you have elements that depend on the entries present in the `/etc/hosts` file of the primary server, you must make the appropriate entries during the failover process.

## Elements Geographic Redundancy manageability status matrix

The following table provides the status of managing the elements in the Geographic Redundancy setup from System Manager:

| Element                                      | Version         | Geographic Redundancy-enable status |
|----------------------------------------------|-----------------|-------------------------------------|
| Avaya Aura® Session Manager                  | 6.3 and later   | GR-aware (Auto)                     |
|                                              | 6.2 and earlier | GR-unaware                          |
| Communication Manager                        | 6.2 and earlier | GR-aware (Manual)                   |
| CS 1000                                      | 7.5             | GR-aware                            |
| Visualization, Performance and Fault Manager | 3.0             | GR-aware                            |
| Avaya Aura® Contact Center                   | 6.3             | GR-aware                            |
| Avaya Breeze® platform                       | 3.0             | GR-aware                            |

*Table continues...*

| Element                                                                                                                                                          | Version | Geographic Redundancy-enable status |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------------|

|  <b>Note:</b><br>The elements that are not listed in this table are GR-unaware. |         |                                     |

## Configuring various elements to change to the secondary System Manager

### Introduction

The sections describe how to reconfigure various GR-unaware elements that the secondary System Manager server manages when the server is activated during outages for an extended period of time, typically for more than 4 hours.

For outages that are less than 4 hours and that occur due to a primary System Manager server failure or a partial network breakdown, do not activate the secondary System Manager server.

If you perform the failover, the recovery process might take a few hours, depending on the data size and whether the recovery is done using the primary or secondary System Manager data.

### Session Manager configuration

Session Manager Release 6.3 and later elements are GR-aware.

In the normal operation mode, all Session Manager Release 6.3 and later elements communicate with the primary System Manager server for provisioned and configuration data.

You can configure both the primary and the secondary System Manager servers as unique trap destinations on each element. During a failover, the primary System Manager server becomes nonoperational, and you must manually activate the secondary System Manager server. Subsequently, all Geographic Redundancy-aware Session Manager elements automatically switch to the secondary System Manager server by using the Arbiter process of Session Manager.

In the primary nonoperational mode, each Session Manager element continues to interact with the primary System Manager server until the element receives an Activation notification from the secondary System Manager server. After the Session Manager element receives a secondary Activation notification, the element switches to the primary nonoperational mode.

In the primary nonoperational mode, the Session Manager element continuously polls the two System Manager servers to determine the current states.

Session Manager continues to communicate with the current managing System Manager server until there is a network disconnect or fragmentation. If there is a disconnect, for example, because

of a network split, the Session Manager switches to an active System Manager that is reachable within the network.

 **Note:**

From the web console of the active System Manager, you can override the automatic switching of Session Manager by using the Manage option.

Session Manager support only Manage operation. These elements do not support the Geographic Redundancy UnManage operation.

[Configuring Session Manager Release 6.2 and earlier during failback](#) on page 134

[Problems in managing Session Manager 6.1 or 6.2 using System Manager 6.2](#) on page 135

## Configuring Session Manager Release 6.2 and earlier during GR failover

Session Manager 6.2 or earlier releases are GR-unaware elements.

### About this task

During a failover, perform this procedure to configure the Session Manager elements to switch to the activated secondary System Manager server:

### Procedure

1. Log in to Session Manager as `cust` or `service`.
2. Run the `ChangeManagementIP` script with the secondary System Manager IP address or FQDN as the target.
3. Stop Session Manager.

Session Manager registers as a DRS node with the secondary System Manager server.

4. Start Session Manager.

The Session Manager element is marked for repair and gets DRS initial load from the secondary System Manager server.

The system overwrites the existing data of the element with the current data in the secondary System Manager database.

**Related links**

[Session Manager configuration](#) on page 133

## Configuring Session Manager Release 6.2 and earlier during failback

During the failback when the primary System Manager server is back online after an outage or failure and ready to serve the devices, you must perform the restore operation. During the restore operation, you can retain the primary or the secondary System Manager database.

## About this task

### Caution:

The following procedure impairs service. Therefore, schedule the restore operation outside of service hours.

When the primary System Manager server is functional, use this procedure to switch back the System Manager elements earlier than Release 6.3 to the primary System Manager server and resume normal operation.

## Procedure

1. Log in to Session Manager as `cust` or `service`.
2. At the prompt, perform the following:
  - a. Enter `cd /opt/Avaya/bin`.
  - b. Enter `ChangeManagementIP` and provide the IP address or FQDN of the secondary System Manager server as the target.

The command changes the configuration on the element. The system prompts for the enrollment password of the primary System Manager server.

3. Stop Session Manager.

Session Manager registers as a DRS node with the primary System Manager server.

4. Start Session Manager.

The Session Manager element is marked for repair and gets DRS initial load from the primary System Manager server.

The system overwrites the existing data of the element with the current data in the primary System Manager server.

## Next steps

After the recovery operation is complete, enable the Geographic Redundancy replication on System Manager web console.

## Related links

[Session Manager configuration](#) on page 133

## Problems in managing Session Manager 6.1 or 6.2 using System Manager 6.2

Do not manage Session Manager 6.2 or 6.1 using System Manager 6.2. If you deploy SIP Endpoints, ensure that this configuration is not a long-term configuration as some functionality is lost in the configuration.

Users cannot successfully complete certain Personal Profile Manager (PPM) operations if the SIP phone is registered to a System Manager 6.1 or 6.2 that is getting service from System Manager 6.3. For example:

- Add a contact to the contact list.

- Update a contact on the contact list.
- Delete a contact from the contact list.
- Change and save the phone volume settings.
- Change and save specific phone settings using the **Home > Settings** menu on the phone, for example, from the 96x1 SIP phone.
- Save the phone identity and update the time of the latest PPM login in the database.

The system internally saves the phone settings and the volume settings operations in the phone, but the settings are lost when you reboot the phone. To retain the settings, the user must log out and log in again. Ensure that another user does not log in to the same phone before the original user logs in back.

---

## Communication Manager configuration

### Configuring Communication Manager during GR failover

Communication Manager is GR-unaware, regardless of the software release.

#### About this task

When the primary System Manager server has failed and the secondary System Manager server is activated, the replication is disabled.

Perform this procedure to configure the Communication Manager elements to switch to the secondary System Manager server.

#### Procedure

1. Log on to the web console of the secondary System Manager server.
2. In the left navigation pane, click **Services > Inventory > Manage Elements**. The system displays the status of Communication Manager as Unmanaged. You cannot administer the Communication Manager elements that System Manager does not manage.
3. Select the Communication Manager elements that you can manage or administer.
4. Click **More Actions > Manage**.
5. Click **Inventory > Synchronization > Communication Manager**.
6. Select the newly managed Communication Manager elements.

Ensure that the system displays the Communication Manager state as Managed.

7. Select Initialize data for selected devices, and click **Now**.

The secondary System Manager server retrieves all data from Communication Manager and is now ready to administer and manage Communication Manager.

 **Note:**

You must perform the Communication Manager synchronization only if Communication Manager is not synchronized with the secondary System Manager server, which happens if the secondary System Manager server is not synchronized with the primary server due to a split network. If you are unsure whether Communication Manager is synchronized with the current System Manager, follow the Synchronization steps.

## Configuring Communication Manager during GR failback

### About this task

Perform the Geographic Redundancy failback operation to resume normal operational behavior.

### Procedure

1. Log on to the web console of the primary System Manager server.
2. Deactivate the secondary System Manager server.

In this state, the heartbeat mechanism between the primary and secondary System Manager servers resumes as in a normal operation scenario, but the Geographic Redundancy replication between the System Manager servers is disabled.

3. Perform the recovery operation and retain the primary or the secondary database of System Manager. During recovery, you can select one of the following databases:
  - The database of the primary System Manager server.
    - The primary System Manager server resumes the state that the server was in before becoming nonfunctional.
    - You cannot see the administration that is performed while the secondary System Manager server manages the devices on the primary System Manager server. Inconsistency in data between Communication Manager and the primary System Manager database is likely. Therefore, run the initialize data job of Communication Manager. If you fail to initialize data, the data between Communication Manager and the primary System Manager server remains inconsistent.
  - The database of the secondary System Manager server.
    - The system overwrites the data in the primary System Manager server.
    - The system restores all the administration or changes done while the secondary server was serving the devices to the primary System Manager server.
    - The primary System Manager server displays the status of all Communication Manager servers that the secondary System Manager manages as UnManaged.

To manage the Communication Manager servers, navigate to **Home > Services > Inventory > Manage Elements** on the primary System Manager server and click **More Actions > Manage**.

### Next steps

Enable the Geographic Redundancy replication on System Manager web console.

## Communication Manager configuration when the primary System Manager server is nonoperational

In the primary nonoperational scenario, you might reach some of the Communication Manager elements from only one of System Manager servers.

## Configuring Communication Manager during GR failover when only the primary server is reachable

### About this task

Communication Manager Release 6.2 and later have a feature to notify all the changes made outside System Manager, for example, using Communication Manager, System Administration Terminal to the configured System Manager. To leverage the notify feature in System Manager Geographic Redundancy, configure Communication Manager with the IP addresses of the primary and the secondary System Manager server in the notification list.

For Communication Manager elements that you can reach only from the secondary System Manager server, perform the following procedure to configure Communication Manager elements to change to the secondary System Manager server.

During failback, perform the same procedure by reversing the roles of the primary and secondary System Manager servers.

### Procedure

1. Log on to the web console of the primary System Manager server.
2. In the left navigation pane, click **Services > Inventory > Manage Elements**.

The system displays the status of Communication Manager as Unmanaged. You cannot administer Communication Manager elements that System Manager does not manage.

3. Select Communication Manager elements that the secondary System Manager server must manage.
4. Click **More Actions > Manage**.

5. Log on to the web console of the secondary System Manager server.

6. In the left navigation pane, click **Services > Inventory > Manage Elements**.

The system displays the status of Communication Manager as Unmanaged. You cannot administer the Communication Manager elements that System Manager does not manage.

7. Select Communication Manager elements that you must change to the secondary System Manager server.
8. Click **More Actions > Manage**.

9. Click **Inventory > Synchronization > Communication Manager**.

Perform Step 10 only if Communication Manager is not synchronized with the secondary System Manager server. This can happen if the secondary System Manager server is not synchronized with the primary System Manager server due to reasons such as the nonoperational state of the primary or split network.

10. Select the newly managed Communication Manager elements.

Ensure that the system displays the manageability status of Communication Manager as Managed.

11. Select Initialize data for selected devices, and click **Now**.

The secondary System Manager server retrieves all data from Communication Manager and is now ready to administer and manage Communication Manager.

 **Note:**

To find the difference between data on the primary and secondary System Manager servers during failback, use **Services > Geographic Redundancy > Restore Data**. The Restore Data dialog box displays comparative data between the primary and secondary System Manager servers when the primary System Manager server is nonoperational. This includes the number of elements that were managed by the primary and secondary System Manager servers, the number of entities modified on the primary and secondary System Manager servers, and the link to the audit logs. With the comparative data, you can decide whether to use secondary or primary System Manager data during failback.

---

## CS 1000 configuration

CS 1000 elements are Active-Active GR-aware. The GR-aware CS 1000 elements are configured to interact with both primary and secondary System Manager servers. The element communicates with System Manager servers for Authentication and Authorization (A&A) related operations. Typically, the element leverages A&A services from the System Manager server that is closest to the element regardless of whether the server is in the primary or secondary mode. The secondary System Manager can serve A&A requests in both standby and active modes.

CS 1000 server deployments are of two types:

- VxWorks-based servers
- Linux-based servers

[Limitations to the CS 1000 functionality support on System Manager](#) on page 142

## Configuring CS 1000 SNMP alarms

### Procedure

1. Get the port number for the CS 1000 SNMP profile.

For more information, see TrapListener service. The default port is 10162.

2. Configure CS 1000 SNMP alarms on the CS 1000 element by using the port number that you received.

For more information, see *Fault Management - SNMP Avaya Communication Server 1000*, NN43001-719.

3. Manage alarms on System Manager.

For more information, see Manage alarms.

## Configuring VxWorks-based CS 1000 servers

### Procedure

Run the following commands to register the information on CS 1000 servers:

```
Register UCMSecurity System
join secDomain
```

#### Related links

[CS 1000 configuration](#) on page 139

## Configuring Linux-based CS 1000 servers

System Manager Geographic Redundancy deployment does not support some of the CS 1000 functionality. For more information, see Limitations to the CS 1000 functionality support on System Manager.

### Procedure

1. On the Security Configuration page, click **Full security configuration** and **Security Configuration**.

The system displays the FQDN validation page.

2. Confirm that the (TLAN) IP address and FQDN values are correct, and click **Next**.

The system displays the Select server type page.

3. Click **Member server** and click **Next**.

The system displays the Enter server information page.

4. Enter the (TLAN) IP address of the primary security server, and click **Next**.

The system displays the Verify primary security server fingerprint page.

5. Verify that the FQDN and fingerprint information for the primary security server is valid, and enter the following details in appropriate fields:

- The primary security server user ID, that is, a UCM user ID with System Administrator role.

- The primary security server password of the user.
6. Click **Next**.  
The system displays the Enter certificate information page.
  7. Enter information in appropriate fields.
  8. Click **Finish**.  
The system displays the Security Configuration Progress page.
  9. To complete the configuration process, click **Restart**. to restart the web server.  
The Security Configuration Progress page confirms that the server is restarting.  
  
The restart process might take up to 5 minutes to complete. You can then establish a new session and log on with your security administrator credentials. The registration process requires configuration of the primary System Manager information on the element. The secondary server information is provided to the element when the element registers with the primary server.

## Meeting Exchange configuration

Meeting Exchange elements are GR-unaware. All communications except for WebLM are initiated from System Manager to Meeting Exchange. For licensing, a WebLM client on Meeting Exchange initiates communication with System Manager. For Meeting Exchange configuration, the data on System Manager is stored in the form of a Binary Large Object (BLOB) and synchronized with the element by using a scheduler job that runs every minute. The Meeting Exchange element is registered with System Manager. As these entities are replicated from the primary to the secondary server, information about the Meeting Exchange elements is present with the secondary System Manager server as well. You do not have to explicitly establish trust between the Meeting Exchange element and System Manager.

### Related links

[Element configuration](#) on page 143

[License management](#) on page 143

## Element configuration

In the failover scenario, you can perform all Meeting Exchange configuration changes from the activate secondary System Manager server. The system synchronizes the changes with the Meeting Exchange element by using Scheduler job. You do not require to make changes on the Meeting Exchange element in this case.

### Related links

[Meeting Exchange configuration](#) on page 143

## License management

To provision licensing from the secondary server, reassociate the Meeting Exchange element with the secondary server. To reassociate the Meeting Exchange element, remove the Meeting Exchange entry from **Services > Inventory > Manage Elements** of the secondary System Manager server and add the entry back again.

### Related links

[Meeting Exchange configuration](#) on page 143

---

## Presence Server configuration

Presence Server 6.2.x and earlier elements are GR-unaware. During failover, configure the Presence Server elements manually to switch to the secondary System Manager. Presence Server elements are registered in System Manager from **Services > Inventory**. All Presence Server configuration data is replicated from the primary to the secondary System Manager server.

### Related links

[Configuring Presence Server](#) on page 144

## Configuring Presence Server

### About this task

Perform this procedure to switch Presence Server elements to the secondary server:

### Procedure

1. Create a backup of the Presence Server data after the failover to be invoked manually by an operator after the failover of System Manager.
2. Run the `changeSMGRFQDN.sh` script on Presence Server element to change Presence Server System Manager configuration from the primary System Manager to secondary System Manager.

The script changes all configurations on the Presence Server element but does not affect Presence Server entries or configuration on System Manager. Presence Server calls InitTM to establish trust with the secondary System Manager. The element is re-registered on the secondary System Manager. The element is registered in DRS and **Services > Inventory**. As part of the registration, Presence Server element is added in `/etc/hosts` of the secondary System Manager. DRS marks the element for repair and sends the initial load of data to the element. Data on System Manager overwrites data on Presence Server element.

3. Log out or log in to the endpoints on failover.
4. Create a backup of Presence Server element after System Manager failover to ensure that the new configuration data is backed up.
5. To ensure continued serviceability support during primary nonoperational scenarios, configure Presence Server elements with both the primary and secondary System Manager servers as trap destinations.

For instructions to configure trap destinations on Presence Server element, see *Administering Avaya Aura® Presence Services*.

## Configuring Messaging in the normal operational mode

### Before you begin

- Add both the primary and secondary servers as Trusted Servers in the Messaging system.
- Update the **Login**, **Password**, and **Confirm Password** fields with the appropriate trusted server defined on the Messaging system.

### Procedure

1. Log on to the primary System Manager server.
2. On the System Manager web console, click **Services > Inventory**.
3. In the navigation pane, click **Manage Elements**.
4. On the Manage Elements page, click **New** and add the Messaging system.
5. Provide the name and IP address of the Messaging system.
6. On the **Attributes** tab, fill the **Login**, **Password**, and **Confirm Password** fields with the corresponding name and password of the Messaging trusted server.
7. Click **Inventory > Synchronization > Messaging System**. Select the required Messaging element, and click **Now**.
8. Perform one of the following:
  - If synchronization is successful, perform the administration task on Messaging.
  - If synchronization fails, check the login details for Messaging.
9. Log on to the secondary System Manager server.
10. On the System Manager web console, click **Services > Inventory**.
11. In the navigation pane, click **Manage Elements**.
12. Ensure that the Messaging system that has been added is visible on the Manage Elements page.

## Configuring Messaging when the primary System Manager server is nonoperational

Perform this procedure to switch the Messaging system to the secondary System Manager when the primary System Manager server fails.

### Before you begin

- Add both the primary and secondary servers as Trusted Servers in the Messaging system.
- Update the **Login**, **Password**, and **Confirm Password** fields with the appropriate trusted server defined on the Messaging system.

## Procedure

1. Log on to the Messaging system that System Manager manages.
2. Add the secondary System Manager server as Trusted Servers in the Messaging system.
3. Log on to the secondary System Manager server.
4. On the System Manager web console, click **Services > Inventory**.
5. In the navigation pane, click **Manage Elements**.
6. On the Manage Elements page, select the Messaging system that you want to change to the secondary System Manager server.
7. Click **Edit**.
8. On the **Attributes** tab, fill the **Login**, **Password**, and **Confirm Password** fields with the corresponding name and password of the Messaging trusted server.
9. Click **Commit**.
10. Click **Inventory > Synchronization > Messaging System**, and select the required Messaging element.
11. Click **Now**.

The secondary System Manager server retrieves all data from Messaging and is now ready to administer and manage Messaging.

## Configuring Messaging during GR failback

### Before you begin

Complete the GR failback from the database of the primary System Manager server.

## Procedure

1. Log on to the primary System Manager server.  
If the trusted server entry for the primary System Manager server is already present in Messaging, perform from the Step 3 e.
2. **(Optional)** Remove the secondary System Manager server as the trusted server in the Messaging system.
3. If you select the database of the secondary System Manager server to recover the data, perform the following steps:
  - a. On the web console of the primary System Manager server, click **Services > Inventory**.
  - b. In the left navigation pane, click **Manage Elements**.
  - c. Select the Messaging element that you must change to the primary System Manager server.

- d. Click **Edit**.
- e. On the Manage Elements page, navigate to the **Attributes** tab and update the **Login**, **Password**, and **Confirm Password** fields with the corresponding name and password of the Messaging trusted service.
- f. Click **Commit** to apply the changes.
- g. Click **Inventory > Synchronization > Messaging System**.
- h. Select the required Messaging element, and click **Now**.

The primary System Manager server retrieves all data from Messaging and is now ready to administer and manage Messaging.

## Configuring Messaging during split network

### About this task

Do not activate primary and secondary System Manager servers except during scenarios such as the primary System Manager server is nonoperational. When the primary System Manager server is nonoperational, not all elements are reachable from either System Manager servers.

Perform the procedure on the primary System Manager server. You cannot administer Messaging on the secondary System Manager server in the standby mode.

### Procedure

1. Log on to the primary System Manager server and the System Manager server and verify that the system displays the replication status as disabled.
2. Add System Manager as the trusted server in the Messaging system.  
If the server is already added as the trusted server, update the login and password details of Messaging for both System Manager servers.
3. Click **Services > Inventory**.
4. In the left navigation pane, click **Synchronization > Messaging System**.
5. Select the Messaging element and click **Now**.
6. Perform one of the following:
  - If the synchronization is successful on both System Manager servers, perform the administration task for Messaging on both System Manager servers.
  - If the synchronization fails, check the login details for Messaging.

While performing administrative tasks on Messaging, the system displays a warning message that the changes can result data inconsistency.
7. To perform administration tasks only on the primary System Manager server, remove the trusted server entry of the secondary System Manager server from Messaging.

## Avaya Aura® Conferencing configuration

Avaya Aura® Conferencing elements are GR-unaware. During a failover or split network, you must manually configure to point the Avaya Aura® Conferencing element to the secondary System Manager server.

The following components of Avaya Aura® Conferencing are integrated with System Manager:

- License Management
- Trust Management
- User Management
- Logs
- Single Sign-On
- Role based access control
- Alarms

## Configuring Avaya Aura® Conferencing to be managed by System Manager

### Before you begin

From System Manager, get the information for the community string and the Trap Listener port number.

### About this task

For the Avaya Aura® Conferencing components to function, configure the IP address and FQDN of the active System Manager in the Element Manager console of Avaya Aura® Conferencing.

### Procedure

1. On the web browser, type `http://<IP address>:12120`.

where *IP address* is the logical IP address of the server that is running the Element Manager Internal OAM Service.

2. Press **Enter**.

The system displays a webpage with the IP address that you entered and the **Launch Element Manager Console** link.

3. Click **Launch Element Manager Console**.
4. In the navigation pane of **Element Manager Console**, select **Addresses**.
5. In the Addresses window, click **Add (+)**.
6. In the Add IPv4 Address dialog box, complete the following fields:
  - **Logical Name**: Type SMGRAddress.
  - **IPv4 Address**: Type the IP address of the primary System Manager.
7. Click **Apply**.
8. Repeat Step 3 through Step 5 on the secondary System Manager, and enter a logical name and IP address.
9. In the navigation pane, click **External Nodes**.
10. In the External Nodes window, click **Add (+)**.
11. In the Add External Nodes dialog box, complete the following fields:
  - **Name**: Type SMGRNode.
  - **IPv4 Address**: Select SMGRAddress from the list.
12. Click **Apply**.
13. Repeat Step 8 through Step 10 for the secondary System Manager, and enter a name.  
Select the logical name that you entered in Step 6.
14. In the navigation pane, click **OAM Profiles > OSS Servers**.
15. Click **Add (+)**.
16. In the Add OSS Server dialog box, complete the following fields:
  - **Name**: Type a name, for example, SmgrOssServer.
  - **Node**: Select SmgrExtNode from the list.
  - **Use External OAM Network**: Do not select this check box.
17. Click **Apply**.
18. Repeat Step 12 through Step 15 for the secondary System Manager, and enter a name.  
Select the node entered in Step 11.
19. In the navigation pane, click **OAM Profiles > SNMP Managers**.
20. Click **Add (+)**.
21. In the Add SNMP Manager dialog box, complete the following fields:
  - **Name**: Type a name, for example, SmgrSnmpManager.

- **Community:** Type the community string as obtained from System Manager.
- **Servers:** Select the server name you created in Step 14, for example, SmgrOssServer.
- **Trap Port:** Type the Trap Listener port number as obtained from System Manager.

22. Click **Apply**.

23. Repeat Step 17 through Step 20 for the secondary System Manager, and enter a name, the community string, and the trap port.

Select the server name that you entered in Step 16.

24. Restart Element Manager through SSH to the server.

[Avaya Aura Conferencing configuration](#) on page 148

## License management

Avaya Aura® Conferencing license key is installed on System Manager for forwarding license requests to the Avaya WebLM server residing on System Manager. For initial setup with the primary or active System Manager, follow the procedure in *Deploying Avaya Aura® Conferencing*. During a failover in a System Manager Geographic Redundancy setup, for license management to work, reconfigure the IP address and FQDN to match the IP address and FQDN of the active System Manager.

#### Related links

[Avaya Aura Conferencing configuration](#) on page 148

## Trust management

For the initial setup, follow the procedures in *Deploying Avaya Aura® Conferencing*. Because the same root Certificate Authority exists on the primary and the secondary System Manager, you can use the same end-identity certificate for both System Manager servers. During a failover in a System Manager Geographic Redundancy setup, for trust management to work, reconfigure the IP address and FQDN to match the IP address and FQDN of the active System Manager.

#### Related links

[Avaya Aura Conferencing configuration](#) on page 148

## Single Sign-On and Role Based Access Control

For the initial setup, follow the procedures in *Deploying Avaya Aura® Conferencing*. In a System Manager Geographic Redundancy setup, all elements in the inventory, such as Avaya Aura® Conferencing Element Manager and Avaya Aura® Conferencing Provisioning Client, admin users and passwords, Role Based Access Control (RBAC) attributes replicate between the primary and secondary System Manager. For Single Sign-On (SSO) and RBAC to function during a failover, reconfigure the IP address and FQDN to the IP address and FQDN of the active System Manager.

#### Related links

[Avaya Aura Conferencing configuration](#) on page 148

## User management

For the initial setup, follow the procedures in *Deploying Avaya Aura® Conferencing*. In a System Manager Geographic Redundancy setup, all elements in the inventory, user profiles, and user data in the System Manager database replicate between the primary and secondary System Manager. During a failover in System Manager Geographic Redundancy setup, Single Sign-On or RBAC must work for user management. Reconfigure the IP address and FQDN to match with the IP address and FQDN of the active System Manager.

### Related links

[Avaya Aura Conferencing configuration](#) on page 148

## Logs

For the initial setup, follow the log forwarding procedures in *Deploying Avaya Aura® Conferencing*. In a System Manager Geographic Redundancy setup, send the logs to the active System Manager. In a GR-enabled System Manager pair, the enrollment password is the same for the primary and active System Manager servers. During a failover in a System Manager Geographic Redundancy setup, for log forwarding to the active System Manager, run the logAgent script again with the IP address or FQDN of the active System Manager, the same https System Manager port, and the same enrollment password.

### Related links

[Avaya Aura Conferencing configuration](#) on page 148

## Alarms

For the initial setup, follow the alarm forwarding procedures in *Deploying Avaya Aura® Conferencing*. You can configure Avaya Aura® Conferencing to use two SNMP managers and hence two alarm destinations. See section 5.8.2 for configuring primary and secondary System Manager servers as two trap destinations.

## Avaya Meetings Server configuration

The Avaya Meetings Server element is GR-unaware. During a failover or split network, you must manually configure SSO on the Avaya Meetings Management console.

### Note:

If secondary System Manager is using the same IP or FQDN of the primary System Manager, then you do not need to configure SSO for Avaya Meetings Server.

## Configuring SSO for Equinox Conferencing

### Exchanging CA certificates between System Manager and Avaya Meetings Management

#### About this task

If the Avaya Meetings Management CA certificate is not issued by the System Manager CA, perform the following.

#### Procedure

1. Download the CA PEM file from System Manager.

For more information, see “Downloading the System Manager PEM certificate”.

#### **Note:**

If System Manager has more than one CA, import all the CAs into Avaya Meetings Management.

2. Log in to the Avaya Meetings Management administrator portal.
3. To import the CA PEM file into Avaya Meetings Management, click **Settings > Security > Certificate**.
4. Click **Import**.
5. On the Import certificates dialog box, click **Add** to select the downloaded PEM file, and click **Apply**.
6. Restart Avaya Meetings Management.
7. To download the Avaya Meetings Management CA certificate, click **Settings > Security > Certificate**.
8. On the Certificates page, click **Conferencing Management Certificate**.
9. On the System Manager web console, click **Services > Inventory**.
10. In the navigation pane, click **Manage Elements**.
11. On the Manage Elements page, select the System Manager certificate and click **More Actions > Manage Trusted Certificates**.
12. On the Manage Trusted Certificates page, click **Add**.
13. On the Add Trusted Certificates page, click **Import as PEM certificate**.
14. Copy the content of the Avaya Meetings Management CA certificate and paste the content in the text box provided on the Add Trusted Certificates page.
15. Click **Commit**.

#### Related links

[Avaya Meetings Server configuration](#) on page 151

[Downloading the System Manager PEM certificate](#) on page 153

[Configuring SSO in Avaya Meetings Management](#) on page 153

**Downloading the System Manager PEM certificate****Procedure**

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. Click **CA Functions > CA Structure & CRLs**.
4. Click **Download PEM file**.

The system downloads the .pem file on your system.

**Related links**

[Exchanging CA certificates between System Manager and Avaya Meetings Management](#) on page 152

**Configuring SSO in Avaya Meetings Management****Before you begin**

If the Avaya Meetings Management CA certificate is not issued by the System Manager CA, exchange CA certificates between Avaya Meetings Management and System Manager.

- Download the CA certificate from System Manager and import the certificate into the Avaya Meetings Management console.
- Download the certificate from the Avaya Meetings Management console and add the certificate in to System Manager as a new trusted certificate.

For more information, see “Exchanging CA certificates between System Manager and Avaya Equinox Management”.

**Procedure**

1. Navigate to `/opt/Avaya/iview/tomcat/webapps/iview/WEB-INF/classes/sso_config/securityServerConfig.properties`, and edit the properties of the file as follows.

```
openssoclient.config.folder=../config
com.iplanet.am.cookie.name=<FQDN of your System Manager>
security.server.fqdn=<FQDN of your System Manager>
```

2. Navigate to `/opt/Avaya/iview/tomcat/config/vcs-core.properties` and add the `vnex.auth.smgr.sso=true` property.
3. Before restarting Tomcat, navigate to `/opt/Avaya/iview/tomcat/config/` and delete the `OpenSSOClient` folder.
4. To restart Tomcat, do one of the following:
  - On the shell, run the `service avaya.iview restart` command.
  - On the Avaya Meetings Management console, click **Restart**.

---

## IP Office configuration

IP Office elements are GR-unaware. During failover, split network, or failback, perform the procedures from this section to ensure data integrity and proper administration of IP Office from System Manager. As the System Manager certificates contain an entry of the secondary System Manager in the **SAN** field, the same trust continues to work between the secondary System Manager and the IP Office element.

### Important:

- The System Manager lock is maintained on the IP Office device to ensure that changes are not provisioned on the device outside System Manager. You can only make configuration changes on IP Office after removing the System Manager lock. For more information, see *Implementing IP Office*.
- If IP Office has been added to any System Manager previously, then before reusing it, you must erase the IP Office security settings using the **File > Advanced > Erase Security Settings** page on the IP Office Manager window.

[IP Office configuration in the Active-Active scenario](#) on page 156

[Alarms](#) on page 156

[User management](#) on page 156

## Configuring IP Office in normal operational mode with SCEP enabled

### Procedure

1. On the System Manager web console, click **Services > Security**.
2. In the navigation pane, click **Certificates > Authority**.
3. Click **RA Functions > Add End Entity** and add IP Office as an entity and specify all required details.
4. On the IP Office device, open the security settings and perform the following:
  - a. Set SCEP to **active**.
  - b. Specify the correct IP address of System Manager and the certificate name that you added on System Manager.
  - c. Set the received certificates check to **High**.
5. Log on to the web console of the primary System Manager server.

6. On the System Manager web console, click **Services > Inventory**.
7. In the navigation pane, click **Manage Elements**.
8. Click **New**.
9. On the Add IP Office page, provide the name, the IP address, and the valid user name and password for IP Office.
10. Verify that the system receives the SCEP requests from the device at the specified interval using system monitor for the IP Office device.  
  
The primary System Manager server is now ready to administer and manage the IP Office device.
11. Log on to the web console of the secondary System Manager and click **Services > Inventory**.
12. In the left navigation pane, click **Manage Elements**.  
  
The Manage Elements page displays the IP Office devices that you added on the primary System Manager.

#### Related links

[IP Office configuration](#) on page 154

## Configuring IP Office in normal operational mode with SCEP disabled

### Procedure

1. Log on to the web console of the primary System Manager server.
2. On the System Manager web console, click **Services > Inventory**.
3. In the navigation pane, click **Manage Elements**.
4. Click **New**.
5. On the Add IP Office page, provide the name, the IP address, and the valid user name and password for IP Office.
6. Click **Commit**.  
  
The primary System Manager server is now ready to administer and manage the IP Office device.
7. Log on to the web console of the secondary System Manager, and click **Services > Inventory**.
8. In the left navigation pane, click **Manage Elements**.  
  
The Manage Elements page displays the IP Office devices that you added on the primary System Manager.

#### Related links

[IP Office configuration](#) on page 154

## IP Office configuration when the primary System Manager is nonfunctional

If the primary System Manager server is nonfunctional, the secondary System Manager server can administer and manage the IP Office device without any additional steps on the secondary System Manager.

### Related links

[IP Office configuration](#) on page 154

## IP Office configuration in the Active-Active scenario

If the primary System Manager server is nonfunctional, the secondary System Manager server can administer and manage the IP Office device without any additional steps on the secondary System Manager.

If the IP Office element can communicate with both System Manager servers, you can administer IP Office from both System Manager servers. The data from the two servers conflict. During recovery, you must select the database of only one System Manager, and the changes in the other database are lost.

Manage the IP Office elements from only one System Manager even in the Active-Active scenario so that you can select this database for recovery when the communication between the two System Manager servers is reestablished. For more information about managing IP Office from System Manager, see *Implementing the Avaya IP Office for an Aura Configuration*.

### **Note:**

For configuring the trap destination, SCEP details, and WebLM server in a single step, run the Initial Installation Utility of Native B5800 Manager.

You can also use the installation utility to change the configuration on IP Office for the System Manager failover scenarios. As the System Manager certificates contain an entry of the secondary System Manager in the **SAN** field, the same trust continues to work between the secondary System Manager and IP Office.

### Related links

[IP Office configuration](#) on page 154

## Alarms

To ensure serviceability support in primary System Manager nonoperational scenarios, forward the alarms or traps from the IP Office elements to both the primary and secondary System Manager servers. Configure the IP Office device with IPs of both primary and secondary System Manager servers as a trap destination.

### Related links

[IP Office configuration](#) on page 154

## User management

IP Office elements are registered with System Manager in **Inventory > Manage Elements**. The inventory data is replicated from the primary System Manager to the secondary System Manager.

When the secondary System Manager server is activated after failover, you can use the IP Office element for user provisioning from the secondary System Manager without any changes to the IP Office device.

**Related links**

[IP Office configuration](#) on page 154

---

## Visualization, Performance, and Fault Manager

Visualization, Performance, and Fault Manager (VPFM) is Active-Active Geographic Redundancy-aware. VPFM is configured to communicate with primary and secondary System Manager servers. VPFM communicates with System Manager servers for Authentication and Authorization (A&A) operations, such as SSO and RBAC. Usually, the element leverages A&A services from the System Manager server which is closest to the element regardless of whether the server is in the primary or the secondary mode. The secondary System Manager can serve A&A requests in both the standby and active modes.

VPFM leverages System Manager for Common Service Client (SMGR-CS Client) that provides adopters with off-box SSO and RBAC solution that works with System Manager.

---

## Application Enablement Services

Application Enablement Services (AES) uses the licensing feature of System Manager. When System Manager fails, you must reconfigure the WebLM client on AES to point to the correct System Manager for using Licensing Service.

You can configure AES to integrate with centralized System Manager WebLM.

---

## Avaya Aura® Contact Center

Avaya Aura® Contact Center (AACC) is Active-Active GR-aware. AACC elements are configured to communicate with primary and secondary System Manager servers. The element communicates with System Manager servers for Authentication and Authorization (A&A) operations such as Single Sign-On (SSO) and Role Based Access Control (RBAC). Usually, the element leverages A&A services from the System Manager server that is closest to the element regardless of whether System Manager is in the primary or the secondary mode. The secondary System Manager can serve A&A requests in the standby and active modes.

---

## Avaya Multimedia Messaging configuration

Avaya Multimedia Messaging is GR-unaware. During the failover of the primary System Manager, you must configure the Avaya Multimedia Messaging server manually to use the secondary System Manager server.

For procedures to configure the System Manager connection details on the Avaya Multimedia Messaging server, see *Deploying Avaya Multimedia Messaging*. The document is available on the support site at <https://support.avaya.com>.

# Chapter 5: Managing groups and roles for resources

---

## Managing groups

---

### Group management

Group and Lookup Service (GLS) is a shared service that provides group administration and lookup service for managed resources. GLS encapsulates the mechanisms for creating, changing, searching, and deleting groups and group memberships. Use GLS to group resources in ways that work best for the business, such as organizing resources by location, organization, and function.

On the System Manager web console, with GLS, you can assign different roles to administrators and allow administrators to perform only limited tasks on group of resources. For example, you can create a user group so that only an authorized user can manage the user group.

GLS supports group administration for the following common resources:

- Shared across elements, such as roles and users
- Unshared element-specific resources

GLS contains a repository of groups and memberships from System Manager and other applications that use the GLS service. GLS synchronizes the resources with other Avaya applications and services that manage these resources. GLS maintains resource IDs and their group memberships. With GLS, you can search for one or more resources based on their attribute values and get resource attributes for one or more resources.

With GLS, you can perform the following operations:

- Create groups.
- View and change groups.
- Create duplicate groups by copying properties of existing groups.
- Move groups across hierarchies.
- Assign and remove resources for groups.
- Delete groups.
- Synchronize groups.

As a shared service, GLS reduces the time and effort involved by defining reusable groups of managed resources that more than one application or service requires. For example, you can use the group of resources to assign permissions through Role Based Access Control (RBAC).

---

## Viewing groups

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Groups**.
3. On the Group Management page, select a group and perform one of the following:
  - If the group is a selection-based group, click **View**.
  - If the group is a query-based group, click **View** and click **Execute Query**.

The system displays the View Group page with the details of the group and the resources assigned to the group.

### Related links

[View Group field descriptions](#) on page 170

---

## Creating groups

### About this task

You can create up to 300 groups.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Groups**.
3. On the Group Management page, perform one of the following:
  - Click **New** to create a group.
  - Select a group and click **New** to create a subgroup within a group.
4. On the New Group page, enter the name, type, group membership, and a description of the group.
5. Click **Commit**.

The system creates the new group.

### Related links

[New Group field descriptions](#) on page 168

---

## Modifying groups

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Groups**.
3. On the Group Management page, select a group.
4. Click **Edit** or **View > Edit**.
5. On the Edit Group page, enter the appropriate information.
6. Click **Commit** to save the changes to the database.

### Related links

[Edit Group field descriptions](#) on page 172

---

## Creating duplicate groups

### About this task

You can create a duplicate group by copying the properties of an existing group. When you create a duplicate group, the system copies all the information, except the hierarchy, from the existing group to the new group.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Groups**.
3. On the Group Management page, select a group.
4. Click **Duplicate**.
5. On the Duplicate Group page, perform one of the following:
  - Click **Root** to create a duplicate group at the root level.
  - Select a group and click **Selected Group** to create a duplicate group within another group.

The system displays a copy of the parent group on the Group Management page.

6. Click the plus sign (+) to view the subgroups in a group.

### Related links

[Duplicate Group field descriptions](#) on page 174

---

## Deleting groups

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Groups**.
3. On the Group Management page, select the groups that you want to delete.
4. Click **Delete**.
5. On the Delete Group confirmation page, click **Delete**.

The system confirms the successful deletion of groups and displays the details of groups that the system failed to delete.

The system does not delete the resources.

### Related links

[Delete Group Confirmation field descriptions](#) on page 173

---

## Moving groups

### About this task

You can move a group from one hierarchy to another.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Groups**.
3. On the Group Management page, select a group.
4. Click **More Actions > Move**.
5. On the Move Group page, perform one of the following:
  - To move a group to the root level, click **Root**.
  - To move a group to a different group or subgroup, select the target group or subgroup, and click **Selected group**.
6. To view the subgroups in a group, click the plus sign (+).

### Related links

[Move Group field descriptions](#) on page 174

---

## Synchronizing resources for a resource type

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Groups**.
3. On the Group Management page, click **More Actions > Sync**.
4. On the Resource Synchronization page, in the **Type** field, select the type of resources.
5. Click **Sync**.

### Related links

[Resource Synchronization field descriptions](#) on page 175

---

## Assigning resources to a group

### About this task

You can assign only resources of the type that is configured for the group. The type of resource that you can assign to a group is set when you create a group. For example, if the type of resource is set to Users, you can assign only user types to the group. If the type is set to ALL, you can assign all types of resource to the group.

#### **Note:**

In System Manager, the users that you add to a group can only manage the resources that are assigned to the group and cannot add new users.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Groups**.
3. On the Group Management page, click **New**.
4. Enter the name of the group, and select a group type.
5. Perform one of the following:
  - To assign a resource to a new group, click **Assign Resources**.
  - To assign a resource to an existing group, perform one of the following:
    - Click **Edit > Assign Resources**.
    - Click **View > Edit > Assign Resources**.

6. On the Resources page, select a resource.

The Resources page displays all resources available in the application. You cannot select the resources that are assigned to a group.

You can also search for a resource by using **Advance Search**.

7. Click **Add To Group**.

The system adds the selected resources to the group.

**Related links**

[Resources field descriptions](#) on page 178

---

## Searching for resources

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the left navigation pane, perform one of the following:
  - Click **Groups**.
  - Click **Resources** and continue with Step 4.
3. On the Group Management page, perform one of the following:
  - Click **New > Assign Resources**.
  - Select a group and click **Edit > Assign Resources**.
  - Select a group and click **View > Edit > Assign Resources**.
4. On the Resources page, click **Advanced Search**.
5. In the **Criteria** area, perform the following:
  - a. In the **Type** field, select the resource type.
  - b. In the **Resource Attributes** area, select the attribute name, the matching operator, and the search string from the appropriate fields.
6. To add more than one search condition, click the plus sign (+).

Click the minus sign (-) to delete a search condition. You can delete a search condition only if you have more than one search condition.
7. In the drop-down field, click **And** or **Or**.

The system displays this option only when you use the plus sign (+) to add a search condition.
8. Click **Search**.

The **Resources** section displays the resources that match the search criteria. If no resources match the search criteria, the **Resource** section displays the message `No records are found`.

---

## Searching for groups

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Groups**.
3. On the Group Management page, click **Advanced Search**.
4. In the **Resource Attributes** section, select the attribute name, the matching operator, and the search string from the appropriate fields.
5. To add more than one search condition, click the plus sign (+).  
Click the minus sign (-) to delete a search condition. You can delete a search condition only if you have more than one search condition.
6. In the drop-down field, select **And** or **Or**.

The system displays this option when you use the plus sign (+) to add a search condition.

7. Click **Search**.

## Filtering groups

### About this task

You can apply filter to the following fields:

- **Name**
- **Type**
- **Hierarchy**

You can filter groups by a single column or multiple columns.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Groups**.
3. On the Group Management page, click **Filter: Enable**.
4. In the **Name** field, enter the group name.
5. In the **Type** field, select the resource type.
6. In the **Hierarchy** field, enter the hierarchy level.

When you enter a hierarchy level, the table displays only those groups that you created under that level. For example, to view all groups that you created under root, enter / as the hierarchy level.

7. Click **Apply**.

The page displays the groups that match the filter criteria.

8. **(Optional)** Perform the following:

- To hide the column filters, click **Disable**.

This action does not clear the filter criteria that you have set.

- To clear the filter criteria, click **Clear**.

---

## Filtering resources

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the left navigation pane, perform one of the following:
  - Click **Groups**.
  - Click **Resources** and continue with Step 5.
3. On the Group Management page, select a group to assign a resource to an existing group.
4. Perform one of the following:
  - Click **New > Assign Resources**.
  - Click **Edit > Assign Resources**.
  - Click **View > Edit > Assign Resources**.
5. On the Resources page, click **Filter: Enable** and perform the following:
  - a. In the **Name** field, enter the resource name.
  - b. In the **Type** field, select the resource type.
6. Click **Apply**.
7. **(Optional)** To hide the column filters, click **Disable**. This action does not clear the filter criteria that you have set in the column filters.

### Result

The table displays the resources that match the filter criteria.

## Removing assigned resources from a group

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Groups**.
3. Perform one of the following:
  - Select the resources, and click **Remove** if you have assigned resources to the group while creating the group.
  - Select a group, and click **Edit > Remove**.
  - Select a group, and click **View > Edit > Remove**.

The system removes the association of the resource with the group.

## Group Management field descriptions

| Name                    | Description                                 |
|-------------------------|---------------------------------------------|
| <b>Select check box</b> | The option to select a group.               |
| <b>Name</b>             | The name of the group.                      |
| <b>Type</b>             | The group type based on the resources.      |
| <b>Hierarchy</b>        | The position of the group in the hierarchy. |
| <b>Description</b>      | A brief description of the group.           |

| Button                        | Description                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------------------|
| <b>View</b>                   | Displays the View Group page with details of the selected group.                                   |
| <b>Edit</b>                   | Displays the Edit Group page where you change the information of the selected group.               |
| <b>New</b>                    | Displays the Create Group page where you can create a new group.                                   |
| <b>Duplicate</b>              | Displays the Duplicate Group page where you can duplicate a group to another selected group.       |
| <b>Delete</b>                 | Deletes the selected groups.                                                                       |
| <b>More Actions &gt; Move</b> | Displays the Move page where you can move a group to another group.                                |
| <b>More Actions &gt; Sync</b> | Displays the Resource sync page that you use to synchronize resources of a specific resource type. |
| <b>Advanced Search</b>        | Displays fields where you can specify the criteria for searching a group.                          |
| <b>Filter: Enable</b>         | Displays fields where you can set the filter criteria. This button is a toggle button.             |

| <b>Assign Resources</b> | <p>Displays the Resources page where you can search and assign resources to a group.</p> <p> <b>Note:</b><br/>The <b>Assign Resources</b> button is available only when you select <b>Selection Based</b> for creating group members in the group.</p> |
| <b>Commit</b>           | Creates a new group with the specified configurations.                                                                                                                                                                                                                                                                                    |
| <b>Cancel</b>           | Discards the changes that you made to the Create Group page and displays the Group management page.                                                                                                                                                                                                                                       |

## Define Query

The page displays the following fields when you select **Query Based** for creating group members:

| Field       | Description               |
|-------------|---------------------------|
| <b>Name</b> | The name of the resource. |
| <b>Type</b> | The resource type.        |

*Table continues...*

| Field                | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Define Query</b>  | Displays the following fields: <ul style="list-style-type: none"> <li>• <b>Field 1:</b> The list of criteria that you can use to search resources.</li> <li>• <b>Field 2:</b> The list of operators for evaluating the expression. The list of operators depends on the criterion that you selected in <b>Field 1</b>.</li> <li>• <b>Field 3:</b> The value corresponding to the search criteria.</li> </ul> |
| Button               | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
| +                    | Adds a search condition row for defining the new search condition.                                                                                                                                                                                                                                                                                                                                           |
| –                    | Removes a search condition.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Execute Query</b> | Runs the query and fetches resources matching the search conditions defined in the query. The page displays the resources in the <b>Results</b> section.<br><br> <b>Note:</b><br>The system displays the <b>Execute Query</b> button only when you create a query-based group.                                              |

## Assigned Resources

The page displays the following fields when you select **Selection Based** for creating group members:

| Field                   | Description                                                                         |
|-------------------------|-------------------------------------------------------------------------------------|
| <b>Name</b>             | The name of the resource.                                                           |
| <b>Type</b>             | The resource type.                                                                  |
| Button                  | Description                                                                         |
| <b>Assign Resources</b> | Displays the Resources page that you use to search and assign resources to a group. |
| <b>Remove</b>           | Removes the selected resources from the list of assigned resources.                 |

## View Group field descriptions

### View Group

| Field       | Description                            |
|-------------|----------------------------------------|
| <b>Name</b> | The unique name of the group.          |
| <b>Type</b> | The resources that the group contains. |

*Table continues...*

| Field                   | Description                                                                                                                                                                                                                                                                                         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group Membership</b> | The group type that is based on the resources. The options are: <ul style="list-style-type: none"> <li>• If the group is selection-based, the system displays the assigned resources.</li> <li>• If the group is query-based, click <b>Execute Query</b> to view the assigned resources.</li> </ul> |
| <b>Description</b>      | A brief description of the group.                                                                                                                                                                                                                                                                   |

| Button      | Description                                                            |
|-------------|------------------------------------------------------------------------|
| <b>Edit</b> | Displays the Edit Group page where you can edit the group information. |
| <b>Done</b> | Closes the View Group page and displays the Group Management page.     |

## Define Query

The page displays the following fields when you use the **Query Based** option for creating group members:

| Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Define Query</b> | Displays the following fields: <ul style="list-style-type: none"> <li>• <b>Field 1:</b> The list of criteria that you can use to search resources.</li> <li>• <b>Field 2:</b> The list of operators for evaluating the expression. The list of operators depends on the criterion that you selected in <b>Field 1</b>.</li> <li>• <b>Field 3:</b> The value corresponding to the search criteria.</li> </ul> |

| Button               | Description                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>+</b>             | Adds a search condition row for defining a new search condition.                                                                                                                                                                                                                                                                                                      |
| <b>–</b>             | Removes the search condition.                                                                                                                                                                                                                                                                                                                                         |
| <b>Execute Query</b> | Runs the query and fetches resources matching the search conditions defined in the query. The page displays the resources in the <b>Results</b> section. <p> <b>Note:</b></p> <p>The system displays the <b>Execute Query</b> button only when you create a query-based group.</p> |

The page displays the following fields for assigned resources:

| Field       | Description              |
|-------------|--------------------------|
| <b>Name</b> | The name of the resource |
| <b>Type</b> | The resource type        |

## Edit Group field descriptions

You can edit a group. However, you cannot edit the following fields:

- **Type**
- **Group Membership**

### Edit Group

| Field                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>             | The unique name of the group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Type</b>             | The group type based on the resources. The options are: <ul style="list-style-type: none"> <li>• <b>&lt;Resource&gt;</b>: To create a group with members of the same resource type.</li> <li>• <b>All</b>: To create a group without any restrictions on the members of the group.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Group Membership</b> | The group type based on the resources. The options are: <ul style="list-style-type: none"> <li>• <b>Query Based</b>: To create a group that contains resources that match a specific query criteria. Query-based groups can have resources only of a specific type. You can create only resource type query groups. Thus, these groups cannot have subgroups.</li> <li>• <b>Selection Based</b>: To create a group that contains resources based on static assignment. The groups can have subgroups. Subgroups and parent group might have members of the same resource type or different resource types.</li> </ul> <p> <b>Note:</b><br/>You cannot change the group after you create a group.</p> |
| <b>Description</b>      | A brief description of the group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Button        | Description                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------|
| <b>Commit</b> | Saves the changes in the database.                                                                |
| <b>Cancel</b> | Discards the changes that you made on the Edit Group page and displays the Group Management page. |

### Define Query

The page displays the following fields when you select **Query Based** for creating group members:

| Field       | Description               |
|-------------|---------------------------|
| <b>Name</b> | The name of the resource. |
| <b>Type</b> | The resource type.        |

*Table continues...*

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Define Query</b> | Displays the following fields: <ul style="list-style-type: none"> <li>• <b>Field 1:</b> The list of criteria that you can use to search resources.</li> <li>• <b>Field 2:</b> The list of operators for evaluating the expression. The list of operators depends on the criterion that you selected in <b>Field 1</b>.</li> <li>• <b>Field 3:</b> The value corresponding to the search criteria.</li> </ul> |

| Button               | Description                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| +                    | Adds a row for defining a new search condition.                                                                                                                                                                                                                                                                                                                 |
| –                    | Removes the row that defines the search condition.                                                                                                                                                                                                                                                                                                              |
| <b>Execute Query</b> | Runs the query and fetches resources matching the search conditions defined in the query. The page displays the resources in the <b>Results</b> section.<br><br> <b>Note:</b><br>The system displays the <b>Execute Query</b> button only when you create a query-based group. |

## Assigned Resources

The page displays the following fields when you select the **Selection Based** option for creating group members:

| Field       | Description              |
|-------------|--------------------------|
| <b>Name</b> | The name of the resource |
| <b>Type</b> | The type of the resource |

| Button                  | Description                                                                      |
|-------------------------|----------------------------------------------------------------------------------|
| <b>Assign Resources</b> | Displays the Resources page where you can search and assign resources to a group |
| <b>Remove</b>           | Removes the selected resources from the list of assigned resources               |

## Delete Group Confirmation field descriptions

| Field                 | Description                                 |
|-----------------------|---------------------------------------------|
| <b>Name</b>           | The name of the group                       |
| <b>Type</b>           | The group type based on the resources       |
| <b>Hierarchy</b>      | The position of the group in the hierarchy  |
| <b>Description</b>    | A brief description of the group            |
| <b>Subgroup Count</b> | The number of subgroups in the parent group |
| <b>Resource Count</b> | The number of resources in the group        |

| Button | Description                                                          |
|--------|----------------------------------------------------------------------|
| Delete | Deletes the groups listed in the table.                              |
| Cancel | Cancels the delete operation and displays the Group Management page. |

---

## Duplicate Group field descriptions

| Name        | Description                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select      | The option to select a group.                                                                                                                                                                                                                                                                                                |
| Name        | The groups under which you can create a copy of the selected group. Use the plus sign (+) to expand a group.                                                                                                                                                                                                                 |
| Type        | The group type based on resources.                                                                                                                                                                                                                                                                                           |
| Dynamic     | The status that indicates whether the group uses a query to determine the members or contains static members. The options are: <ul style="list-style-type: none"> <li>• <b>true</b>: Indicates that group membership is not permanent.</li> <li>• <b>false</b>: Indicates that the group contains static members.</li> </ul> |
| Description | A brief description of the group.                                                                                                                                                                                                                                                                                            |

| Button         | Description                                                     |
|----------------|-----------------------------------------------------------------|
| Root           | Creates a copy of the selected group at the root level.         |
| Selected Group | Creates a copy of the group that you selected within the group. |
| Cancel         | Discards the changes and displays the Group Management page.    |

---

## Move Group field descriptions

Use this page to move a group to another group or to root level.

| Name        | Description                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Select      | The option to select a group.                                                                                                                                                                                                                                                                                                |
| Name        | The groups to which you can move the selected group. Use the plus sign (+) to expand a group.                                                                                                                                                                                                                                |
| Type        | The group type based on resources.                                                                                                                                                                                                                                                                                           |
| Dynamic     | The status that indicates whether the group uses a query to determine the members or contains static members. ## Resource Synchronization field descriptions

| Name        | Description       |
|-------------|-------------------|
| <b>Type</b> | The resource type |

| Button        | Description                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Sync</b>   | Synchronizes resources for the selected resource type and displays the Group Management page.                   |
| <b>Cancel</b> | Discards the changes that you made to the Resource Synchronization page and displays the Group Management page. |

---

## Managing resources

---

### Manage resources

System Manager contains different types of resources such as users and roles. You can view and filter these resources based on the search criteria. You can also add resources of the same or different types in a group.

---

## Accessing resources

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Resources**.

## Assigning resources to a new group

### About this task

Use this functionality to create a new group and assign resources to the group. You can choose to create the new group at root level or within an existing group.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Resources**.
3. On the Resources page, select a resource from the list or click **Advanced Search** to search for a resource.
4. Click **Add To New Group**.
5. To add a resource to a new group at root level, do the following:
  - a. On the Choose Parent Group page, click **Root**.
  - b. On the Create Group page, enter the appropriate information.
  - c. Click **Commit**.
6. To add a resource to a new subgroup within a group, do the following:
  - a. On the Choose Parent Group page, click a group.  
To select a subgroup of a group, click **+** and click the subgroup.
  - b. Click **Selected Group**.
  - c. On the Create Group page, enter the appropriate information.  
  
The system creates the new group and assigns the selected resources. The system adds the new group within the group that you selected on the Choose Parent Group page.
  - d. Click **Commit**.

---

## Adding resources to a selected group

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Resources**.
3. Select a resource from the resource table.

You can also click the **Advanced Search** link to search a resource.

4. Click **Add To Group**.
5. On the Choose Group page, click a group.
6. Click **Selected Group**.

The Group Management module assigns the selected resources to the selected groups on the Choose Group page.

## Searching for resources

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Resources**.
3. On the Resources page, click **Advanced Search**.
4. In the **Criteria** section, in the **Type** field, select a resource type.
5. In the **Resource Attributes** section, perform the following steps:
  - a. Select the search criterion from the first drop-down field.
  - b. Select the operator from the second drop-down field.
  - c. Enter search value in the third field.
6. **(Optional)** To add another search condition, click the plus sign (+).

Click the minus sign (–) to delete a search condition. You can delete a search condition only if you have more than one search condition.

7. In the drop-down field, click **AND** or **OR**.

The system displays this option when you use the plus sign (+) to add a search condition.

8. Click **Search**.

The Resources section displays the resources matching the search criteria. If no resources match the search criteria, system displays the message `No records are found`.

---

## Filtering resources

### About this task

You can filter and view resources that meet the specified selection criteria. Applying the filters requires you to specify the filter criteria in the fields provided under columns in the table displaying the resources. The column titles are the filter criteria. You can filter resources on multiple filter criteria.

## Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Resources**.
3. On the Resources page, click **Filter: Enable**.
4. Type the resource name in the **ID** field.

You can apply filter on one column or multiple columns.

5. Select the resource type from the **Type** field.
6. Click **Apply**.

To hide the column filters, click **Disable**. This action does not clear the filter criteria that you have set in the column filters.

The table displays resources that match the filter criteria.

| <b>Add to New Group</b> | Displays the Choose Parent Group page. Use this page to add the selected resources to a new group or to a chosen group.             |
| <b>Cancel</b>           | Closes the Resources page and take you to the Create Group page.                                                                    |
| <b>Advanced Search</b>  | Displays fields that you can use to specify the search criteria for searching a resource.                                           |
| <b>Filter: Enable</b>   | Displays fields under the columns <b>ID</b> and <b>Type</b> . You can use them to set the filter criteria. This is a toggle button. |
| <b>Filter: Disable</b>  | Hides the column filter fields without resetting the filter criteria. This is a toggle button.                                      |
| <b>Filter: Apply</b>    | Filters the resources based on the filter criteria.                                                                                 |

*Table continues...*

| Button                                                                            | Description                                               |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------|
| Select: All                                                                       | Select all the resources in the table.                    |
| Select: None                                                                      | Clears the selection for the resources that you selected. |
|  | Refreshes the resource information in the table.          |

### Attributes of Resource section

| Field | Description                                           |
|-------|-------------------------------------------------------|
| Name  | The name of the attribute.                            |
| Value | The value assigned to the attribute for the resource. |

### Resource is member of following groups section

| Field       | Description                                        |
|-------------|----------------------------------------------------|
| Name        | The unique name of the group.                      |
| Type        | The group type based on the resources it contains. |
| Hierarchy   | The position of the group in the hierarchy.        |
| Description | A brief description about the group.               |

### Criteria section

Click **Advanced Search** to view this section. The **Advanced Search** link is available at the upper-right corner of the page.

| Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                | The types based on the resources it contains.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Resource Attributes | <p>Displays the following three fields:</p> <ul style="list-style-type: none"> <li>Drop-down 1: The criteria for searching a resource. The options are attributes of resources for the attribute type selected in the <b>Type</b> drop-down list.</li> <li>Drop-down 2: The list of operators for evaluating the expression. The list of operators depends on the type of attribute selected in the Drop-down 1 list.</li> <li>Field 3 – The value corresponding to the search criteria.</li> </ul> |

| Button          | Description                                                        |
|-----------------|--------------------------------------------------------------------|
| Clear           | Clears the search value that you entered in the third field.       |
| Search          | Searches the resources matching the search conditions.             |
| Close           | Closes the Criteria section.                                       |
| Advanced Search | Cancel the search operation and hides the <b>Criteria</b> section. |

## Choose Group field descriptions

Use this page to add resources to the selected groups.

| Name               | Description                                                                                                                                                                                                                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select</b>      | The option to select a group.                                                                                                                                                                                                                                                                                                |
| <b>Name</b>        | The name of the group.                                                                                                                                                                                                                                                                                                       |
| <b>Type</b>        | The group type based on the type of resources. The options are: <ul style="list-style-type: none"> <li>• Groups with members of the same resource type.</li> <li>• All: Groups having members of any resource types.</li> </ul>                                                                                              |
| <b>Dynamic</b>     | The status that indicates whether the group uses a query to determine the members or contains static members. The options are: <ul style="list-style-type: none"> <li>• <b>true</b>: Indicates that group membership is not permanent.</li> <li>• <b>false</b>: Indicates that the group contains static members.</li> </ul> |
| <b>Description</b> | A brief description of the group.                                                                                                                                                                                                                                                                                            |

| Button                | Description                                                     |
|-----------------------|-----------------------------------------------------------------|
| <b>Expand All</b>     | Displays the subgroups of groups in the list.                   |
| <b>Collapse All</b>   | Hides the subgroups of all expanded groups.                     |
| <b>Selected Group</b> | Adds the resource as a member of the group you selected.        |
| <b>Cancel</b>         | Closes the Choose Group page and returns to the Resources page. |

## Choose Parent Group field descriptions

| Name               | Description                                                                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select</b>      | Use this option to select a group.                                                                                                                                                                                                                                                          |
| <b>Name</b>        | The name of the group.                                                                                                                                                                                                                                                                      |
| <b>Type</b>        | The group type based on the type of resources. The options are: <ul style="list-style-type: none"> <li>• Groups with members of the same resource type.</li> <li>• All: Groups with members of any resource types.</li> </ul>                                                               |
| <b>Dynamic</b>     | Indicates whether the group uses a query to determine its members or has static members. The options are: <ul style="list-style-type: none"> <li>• <b>True</b>: Indicates that group membership is not permanent.</li> <li>• <b>False</b>: Indicates groups with static members.</li> </ul> |
| <b>Description</b> | A brief description of the group.                                                                                                                                                                                                                                                           |

| Button                                                                            | Description                                                                                                          |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Expand All</b>                                                                 | Displays the subgroups of groups listed in the table.                                                                |
| <b>Collapse All</b>                                                               | Hides the subgroups of all the expanded groups.                                                                      |
| <b>Root</b>                                                                       | Displays the New Group page. Use this page to create a new group. The selected resource is the member of this group. |
| <b>Selected Group</b>                                                             | Adds the resource as a member of the selected group.                                                                 |
|  | Refreshes the resource information in the table.                                                                     |
| <b>Cancel</b>                                                                     | Closes the Choose Parent Group page and displays the Resources page.                                                 |

---

## Managing roles

---

### Role Based Access Control

In System Manager, you require appropriate permissions to perform a task. The administrator grants permissions to users by assigning appropriate roles. Role Based Access Control (RBAC) in System Manager supports the following types of roles:

- Built-in
- Custom

With these roles, you can gain access to various elements with specific permission mappings.

Built-in roles are default roles that authorize users to perform common administrative tasks. You can assign built-in roles to users, but you cannot delete roles or change permission mappings in the built-in roles.

You can perform LDAP synchronization of Microsoft Active Directory or other supported directory server administrator roles with System Manager administrator roles. The capability includes system roles and custom roles on System Manager.

 **Note:**

Granular RBAC is not supported for managing Avaya Meetings Server, Web Gateway, and Work Assignment elements by creating custom roles.

| Auditor                                | Gives read-only access to logs, configuration information, and audit files. With this role, you cannot run any command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| System Administrator                   | <p>Gives the super-user privilege.</p> <p>System Administrator is the single all powerful role. With this role, you can perform operations, such as the following:</p> <ul style="list-style-type: none"> <li>• Backup and restore</li> <li>• Scheduling jobs</li> <li>• Bulk import and export</li> <li>• Tenant administration</li> <li>• Geographic Redundancy operations</li> <li>• Element and user management</li> <li>• Software upgrade</li> </ul> <p> <b>Note:</b></p> <ul style="list-style-type: none"> <li>• The System Administrator role replaces the Network Administrator role. System Manager does not support the Network Administrator role.</li> <li>• The page might not display all privileges that the System Administrator role supports. However, the system maps the permissions by implicit wild card rules.</li> </ul> |
| Avaya Services Administrator           | <p>This role is equivalent to the System Administrator role.</p> <p>Depending on the access level that is set in the <b>E-token Authentication</b> section on the External Authentication page, System Manager assigns this role to the service personnel who logs in to the system through Etoken.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Avaya Services Maintenance and Support | <p>Gives read-only access to maintenance logs, the capability to run diagnostics, and view the output of diagnostics tools. Using this role, you cannot run any command that might provide access to another host.</p> <p>System Manager assigns the role to the service personnel who logs in to the system through Etoken. The access level for the role depends on the value that is set in the <b>E-token Authentication</b> section on the External Authentication page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Backup Administrator                   | Gives access to create backups, schedule backups, and restore backups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Role                                    | Privileges                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Provider Administrator template | <p>Gives permissions to:</p> <ul style="list-style-type: none"> <li>• Configure the solution</li> <li>• Manage the organization hierarchy of tenants. For example, site, department, and team.</li> <li>• Assign elements and resource permissions to the site</li> <li>• Manage end users for the tenant</li> <li>• Manage Tenant Administrators and Site Administrators</li> </ul> <p> <b>Note:</b><br/>Service Provider Administrator Template is a template role.</p> |
| Tenant Administrator Template           | <p>Gives permissions to:</p> <ul style="list-style-type: none"> <li>• Manage end users for the tenant</li> <li>• Communication Manager webpages</li> </ul> <p> <b>Note:</b><br/>Tenant Administrator Template is a template role.</p>                                                                                                                                                                                                                                     |
| Discovery Admin                         | Gives permissions to configure the discovery parameters such as SNMP version, SNMP credentials, the subnetworks, and devices that you require to discover. You also have the permissions to schedule and run a discovery operation.                                                                                                                                                                                                                                                                                                                        |
| End-User                                | <p>The administrator assigns this role to the telephony users.</p> <p> <b>Important:</b><br/>You cannot log in to System Manager with the End-User role.</p>                                                                                                                                                                                                                                                                                                            |
| Avaya Breeze Admin                      | Gives read-write access to the Avaya Breeze® platform configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Avaya Breeze Auditor                    | Gives read-only access to Avaya Breeze® platform logs, configuration information, and audit files. With the Auditor role, you cannot run any command that might provide access to another host.                                                                                                                                                                                                                                                                                                                                                            |
| Avaya Breeze Server Admin               | Gives read and write access to all Avaya Breeze® platform management functionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Avaya Breeze Service Profile Admin      | Gives write access only for Service Profiles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Avaya Breeze Services Admin             | Gives write access only for Service Management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Communication Manager Admin             | Gives you access and permission to perform all activities related to Communication Manager.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Messaging System Admin                  | Gives you access and permission to perform all activities related to Messaging or mailbox. You cannot perform any tasks related to Communication Manager as a Modular Messaging administrator.                                                                                                                                                                                                                                                                                                                                                             |
| Presence Admin                          | Gives read-write access to the Presence configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Presence Auditor              | Gives read-only access to logs, configuration information, and audit files. With the Auditor role you cannot run any command that might provide access to another host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Security Administrator        | Gives read-write access to create other logins, create, modify or assign roles, install ASG keys, install licenses, and install PKI certificates and keys.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SIP AS Auditor                | Gives read-only access to all SIP Foundation server management functionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SIP AS Security Administrator | Gives access to the security features provided by the SIP Foundation server. For example, Security Extension.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SIP AS System Administrator   | Gives read and write access to all SIP Foundation server management functionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CS1000_Admin1                 | <p>Gives unrestricted OAM access to most administrative functions and provisioning for all customers on all call servers and related elements. However, the role does not give access to the security and account administration. The role includes basic diagnostic (PDT1) privileges and access to network-level services for deployment, update, and SNMP management for CS 1000 systems. Gives authorization to use all roles on all User Management elements with all permissions.</p> <p>You can access the following elements:</p> <ul style="list-style-type: none"> <li>• All elements of type: CS 1000</li> <li>• All elements of type: Deployment Manager</li> <li>• All elements of type: Linux Base</li> <li>• All elements of type: Patching Manager</li> <li>• All elements of type: SNMP Manager</li> </ul> <p>As this role gives permissions to All elements of type: Linux Base, you cannot use this role if you only require authorization to manage CS 1000 systems. The administrator must create a custom role for the user who requires to manage CS 1000 systems.</p> |

| Role                 | Privileges                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CS1000_Admin2        | <p>Provides unrestricted OAM access including security and account administration, and provisioning for all customers on all call server elements. The role also includes basic diagnostic (PDT1) privileges and access to network-level services for deployment, patching, SNMP, IPsec and SFTP management for CS 1000 systems.</p> <p>You can access the following elements:</p> <ul style="list-style-type: none"> <li>• All elements of type: CS1000</li> <li>• All elements of type: Deployment Manager</li> <li>• All elements of type: IPSec Manager</li> <li>• All elements of type: Linux Base</li> <li>• All elements of type: Patching Manager</li> <li>• All elements of type: Secure FTP Token Manager</li> <li>• All elements of type: SNMP Manager</li> </ul> <p>As this role gives permissions to All elements of type: Linux Base, you cannot use this role if you only require authorization to manage CS 1000 systems. The administrator must create a custom role for the user who requires to manage CS 1000 systems.</p> |
| CS1000_CLI_Registrar | <p>Provides permission to register and unregister each CS 1000 elements, such as Call Server, MGC, and Media Card, using the local device OAM CLI. The role has a single permission value to allow or deny a user to register or unregister an element.</p> <p>You can access the following elements:</p> <ul style="list-style-type: none"> <li>• All elements of type: CS1000</li> <li>• All elements of type: Linux Base</li> </ul> <p>The role does not have CS 1000 security or network level security privileges. The installation and repair technicians specifically require this role.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CS1000_PDT2          | <p>Gives full diagnostic and operating system access to all call servers. The role restricts access to administrative functions and customer provisioning data unless combined with another role.</p> <p>You can access All elements of type: CS1000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| MemberRegistrar      | <p>Gives limited access. You can register new members to the primary server.</p> <p>You can access the following elements:</p> <ul style="list-style-type: none"> <li>• All elements of type: IPSec Manager</li> <li>• All elements of type: LinuxBase</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

*Table continues...*

| Role               | Privileges                                                                                                                                                                                                                                                           |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Patcher            | <p>Gives access to software maintenance functions, such as update and maintenance. You can access the following elements:</p> <ul style="list-style-type: none"> <li>• All elements of type: Linux Base</li> <li>• All elements of type: Patching Manager</li> </ul> |
| Service Technician | <p>The system assigns the role to the service personnel when the service personnel connects to customer systems through the e-token. The Service Technician role has limited privileges as compared to the Avaya Services Administrator role.</p>                    |

## Custom roles

On the Roles page, you can create a custom role that maps to specific elements of different types and specify customized permissions for the elements.

You can assign the roles that you created to users to perform specific tasks on an element. For example, a custom role that you create for a single element can only perform specific tasks on that element. A permission set defines the tasks that you can perform on the element with this role.

You can also define roles that apply to how elements and element types are hierarchically arranged in user-defined groups. When you map a permission to a group, the system takes that group into account when determining user permissions.

### Note:

- When a user who is associated with custom role administers various operations on Communication Manager, which is managed by System Manager, then custom role requires permissions for Scheduler and Communication Manager templates along with required Communication Manager admin permissions. Therefore, custom role must have minimum permissions:
  - For on demand job create/view permissions in Scheduler.
  - To view Communication Manager templates.
- If Communication Manager IP address is changed on the **Inventory > Manage Elements** page, custom users that have roles for that particular Communication Manager cannot access those Communication Managers.

For example, the Communication Manager IP Address can be changed on the Manage Elements page for the following reasons:

- Duplex Communication Manager gets interchanged
- Communication Manager IP Address has been updated manually

If Communication Manager IP Address is changed on the Manage Elements page, you must also update the corresponding Communication Manager role mappings.

## Viewing user roles

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select a role.

In the right pane, the system displays the role name, a description, and the number of users, and also the elements that you can access by using the role.

## Adding a custom role

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select a role, and perform one of the following:
  - Click **New**.
  - Right-click and select **New**.

The role that you select becomes the parent of the role that you create. The permissions available to the new role are limited to the permissions of the parent role.

On the Add New Role page, the system displays the parent role in the **Parent Role Name** field.

4. Type the relevant information in **Role Name** and **Role Description** fields.

5. Click **Commit and Continue**.

The system displays the Role Details page.

6. On the **Element/Service Permissions** tab, click **Add mapping** to define permissions for a role.

You can also click **Copy All From** to copy all the permissions on all types of elements or services from an existing role. For instructions, see Copying permission mapping for a role.

7. Select a group from the **Group Name** field.

Ensure that you create a group before you select the group. For instructions, see Creating groups. For instructions to assign resources to a group, see Assigning resources to a group.

8. **(Optional)** If you leave the **Group Name** field blank, in the **Element or Resource Type** field, click an element or **All**.

9. Click **Next**.

The title of the Permission Mapping page displays the element type that you selected.

10. On the Permission Mapping page, change the permissions that are available for this role as appropriate.

The system displays the permissions that are available for the parent of the role that you created. The system also displays unassigned permissions in a read-only format. Only an administrator can deny, change, or view the permissions for the role.

11. Click **Commit**.

The system displays the Role Details page and the selected permissions.

12. Click **Commit**.

## Adding a custom tenant administrator role

### Procedure

1. On the System Manager web console, click **Services > Tenant Management** and perform the following:
  - a. Create a tenant.
  - b. Add the level 1 organization hierarchy or site to the tenant.
  - c. **(Optional)** Add the level 2 and level 3 organization hierarchy to the tenant.  
For more information, see [Creating a tenant](#).
2. On the System Manager web console, click **Users > Groups & Roles**.
3. In the navigation pane, click **Roles**.
4. On the Roles page, select **System Administrator** and perform one of the following:
  - Click **New**.
  - Right-click and select **New**.
5. On the Add New Role page, enter the values in the **Role Name** and **Role Description** fields.
6. Click **Commit and Continue**.  
The system displays the Role Details page.
7. Click **Copy All From**.
8. In the **Copy from Role** field, click **Tenant Administrator Template**.
9. Click **Copy**.
10. On the Role Details page, click **Add Mapping**.
11. On the Select Element and/or Network Service to Map to Role page, perform the following:
  - a. In **Element or Resource Type**, click **Organization Unit**.
  - b. In **Element or Resource Instance**, click the name of the tenant that you created in Step 1, and click **Next**.
  - c. Select **All** or **Create, Delete, Edit**, or **View** to set the appropriate permissions.
  - d. Click **Commit**.
12. Perform Step 8 and Step 9 to provide appropriate permissions to the tenant for the following organization hierarchy:
  - Level 1 or the site
  - (Optional) Level 2 or the department
  - (Optional) Level 3 or the team

In the **Element or Resource Instance** field, click site, department, or team as appropriate to which you want to set permissions. See Step 11b.

13. **(Optional)** On the Role Details page, click **Add Mapping**, and provide permission mapping.
14. Click **Commit** to confirm your settings.

## Assigning permissions to access Solution Deployment Manager

### About this task

System Manager provides access permissions to Solution Deployment Manager through Role Based Access Control (RBAC) for elements, such as Communication Manager, Session Manager, Branch Session Manager, and IP Office. System Manager defines flexible access privileges for deployment, migration, upgrade, and update so that the users with administrator credentials can create their own roles.

With RBAC, System Manager supports access privileges at the element level and physical location level.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select an existing role, and perform one of the following steps:
  - Click **New**.
  - Right-click and select **New**.

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

4. On the Add New Role page, type the name and the description for the role.
5. Click **Commit and Continue**.
6. Click **Add Mapping**.
7. In **Group Name**, select the group of templates to which you want to apply this permission.  
You can leave **Group Name** blank if you do not want to select a group.
8. In the **Element or Resource Type** field, select **Solution Deployment Manager**.
9. In the **Element or Resource Instance** field, select **All**.
10. Click **Next**.
11. In Upgrade Management and VM Management, select appropriate permissions, and click **Commit**.

The user can now access the Solution Deployment Manager links.

To assign user permissions, select **Users** in **Element or Resource Type**. Select appropriate permissions, and click **Commit**.

## Mapping permissions by using the template

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select a role and click **Edit**.
4. In the **Element/Service Permissions** tab, click **Add Mapping**.
5. In the **Element or Resource Type** field, select an element, for example, CS 1000.

6. Click **Next**.

The system displays the permission mapping for the element that you selected.

7. Perform the following as appropriate to modify permissions:

- a. Select a different permission from the **Template for permission set** field.
- b. Select permissions.
- c. Clear permissions.

8. Click **Commit**.

## Assigning users to a role

To assign a role to an end user, follow the instructions outlined in Assigning roles to a user. An end user is a user with no role or the End-User role.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select a role and click **Edit**.
4. On the Role Details page, click the **Assigned Users** tab.
5. Click **Select Users** to assign a role to users or edit a role.

The system displays the Assigned Users page.

 **Note:**

The system does not display end users in the **Assigned Users** list. You can assign a role to an end user from **User Management > Manage Users**. For more information, see Assigning roles to a user.

6. Select users to whom you want to assign the role.
7. Click **Commit**.

The system displays the permissions for the role on the Role Details page.

---

## Unassigning users from role

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select a role and click **Edit**.
4. On the Role Details page, click the **Assigned Users** tab.
5. Click **Selected Users**.
6. On the Assigned Users page, clear the check box of the user whom you want to unassign.
7. Click **Commit**.

---

## Copying permission mapping for a role

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select a role and click **Edit**.
4. On the Role Details page, click the **Element/Service Permissions** tab.
5. Click **Copy All From**.

The system displays the Permission Mapping page.

6. In the **Copy From Role** field, select a role.

The system displays all child roles of the parent of this role and all child roles of this role.

 **Note:**

Using the **Copy From Role** option, you cannot copy permissions from the System Administrator role.

7. Click **Copy**.

The system displays the Role Details page

8. Click **Commit**.

The system displays the Roles page where you can view the details of the role.

## Editing a custom role

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select a role and click **Edit**.
4. On the Role Details page, edit the **Role Name** and **Description** fields.
5. Click **Commit and Continue**.
6. On the **Element/Service Permissions** tab, click **Add mapping** and change the permissions for a role as appropriate.  
For more information, see Mapping permissions using the template.
7. Click **Commit**.

## Deleting custom roles

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select one or more roles that you must delete and perform one of the following:
  - Click **Delete**.
  - Right-click and select **Delete**.
4. On the Delete Roles page, click **Delete** to continue with the deletion.

When you delete a role, the system deletes all child roles of the role.

You cannot delete the implicit roles from the Roles page. However, the system deletes the implicit roles when the administrator deletes the tenant or site.

---

## Roles field descriptions

The Roles page contains two panes. The left pane displays the tree structure of roles. The right pane displays the details of the role that you select on the left pane.

| Name                    | Description                                      |
|-------------------------|--------------------------------------------------|
| <b>Role Description</b> | A brief description of the role                  |
| <b>No of users</b>      | The number of users associated with the role     |
| <b>Elements</b>         | The name of elements that are mapped to the role |

| Button        | Description                                                                           |
|---------------|---------------------------------------------------------------------------------------|
| <b>New</b>    | Displays the Add New Role page where you can add a custom role.                       |
| <b>Delete</b> | Displays the Delete Roles page where you can confirm the deletion of the custom role. |
| <b>Edit</b>   | Displays the Role Details page where you can change the custom role.                  |

| Icon                                                                              | Description                                     |
|-----------------------------------------------------------------------------------|-------------------------------------------------|
|  | Searches for the role based on the search text. |
|  | Clears the search text.                         |

## Add New Role field descriptions

| Name                    | Description                                                                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parent Role Name</b> | The parent role that you selected on the Roles page to create the new role.<br><b>Parent Role Name</b> is a read-only field.                                                                |
| <b>Role Name</b>        | The name of the custom role that you want to add.<br>The name must be 1 to 256 characters long and can include characters: a-z, A-Z, 0-9, -, _, and space.<br>You can add up to 1500 roles. |
| <b>Role Description</b> | A brief description of the role.                                                                                                                                                            |

| Button                     | Description                                                                  |
|----------------------------|------------------------------------------------------------------------------|
| <b>Commit and Continue</b> | Saves the role name and description and takes you to the Roles Details page. |
| <b>Cancel</b>              | Cancels the permission mapping and returns to the Roles page.                |

## Assigned Users field descriptions

The system displays the Assigned Users page when you click **Select Users** on the **Assigned Users** tab of the Role Details page. You can select users to grant permissions that are associated with this role.

| Name             | Description                                                                                                                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Name</b> | The name of the user that you assign to the role.                                                                                                                                                                                                                                    |
| <b>Full Name</b> | The full name of the user that is assigned to the role.                                                                                                                                                                                                                              |
| <b>Type</b>      | The type of user. The options are: <ul style="list-style-type: none"> <li>• <b>local</b>: Indicates that users are stored in the directory server of System Manager.</li> <li>• <b>external</b>: Indicates that users are stored in the directory server of the customer.</li> </ul> |

| Button        | Description                                              |
|---------------|----------------------------------------------------------|
| <b>Commit</b> | Assigns the selected users to the role.                  |
| <b>Cancel</b> | Cancels the action and returns to the Role Details page. |

## Permission mapping field descriptions

The page displays the following fields when you click **Add Mapping** on the Role Details page.

| Name                               | Description                                                                                         |
|------------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Template for permission set</b> | The permission to which you want to map the role.                                                   |
| <b>Select/Unselect All</b>         | A toggle button to select or clear the functions that users with a role can perform on the element. |

| Button        | Description                              |
|---------------|------------------------------------------|
| <b>Commit</b> | Maps the permissions to the custom role. |

*Table continues...*

| Button        | Description                                                                 |
|---------------|-----------------------------------------------------------------------------|
| <b>Cancel</b> | Cancels the permission mapping action and returns to the Role Details page. |

The page displays the following fields when you click **Copy All From** on the Role Details page.

| Name                  | Description                                                                         |
|-----------------------|-------------------------------------------------------------------------------------|
| <b>Copy from Role</b> | The role from where you can copy all permission mappings for the element or service |

| Button        | Description                                                   |
|---------------|---------------------------------------------------------------|
| <b>Copy</b>   | Copies the permission mapping for your custom role.           |
| <b>Cancel</b> | Cancels the copy action and returns to the Role Details page. |

# Chapter 6: Granular role based access control

---

## Granular RBAC

With Granular role based access control (RBAC), you can restrict access to resources such as Communication Manager servers, and objects of the resources such as endpoints and hunt groups.

When you create a role, you must select the resources for which a user should have access. You can assign permissions, or a combination of permissions to users. The permissions include adding, editing, deleting, or duplicating objects.

For certain objects, you can provide restricted access for a specific range to achieve range-level granularity of permissions. For example, for endpoints, you can provide access to a particular range of extensions.

Using Granular RBAC, you can define the range for the following Communication Manager objects:

| Name                    | Supported range                                            |
|-------------------------|------------------------------------------------------------|
| Endpoint                | Endpoint extension ranges                                  |
| Agent                   | Agent extension ranges                                     |
| Announcement            | Announcement extension ranges                              |
| Audio Group             | 1–50                                                       |
| Best Service Routing    | 1–511                                                      |
| Holiday Table           | 1–999                                                      |
| Variables               | From A-Z and AA-ZZ for all Communication Manager templates |
| Vector                  | 1–8000                                                     |
| Vector Directory Number | Digits                                                     |
| Vector Routing Table    | 1–999                                                      |
| Service Hours Table     | 1–999                                                      |
| Coverage Answer Group   | 1–1500                                                     |
| Coverage Path           | 1–9999                                                     |
| Coverage Remote         | 1–10000                                                    |

*Table continues...*

| Name                        | Supported range                |
|-----------------------------|--------------------------------|
| Coverage Time of Day        | 1–1000                         |
| Off PBX Endpoint Mapping    | Off PBX Endpoint Mapping range |
| Group Page                  | 1–999                          |
| Hunt Group                  | 1–8000                         |
| Intercom Group              | 1–1024                         |
| Pickup Group                | 1–5000                         |
| Terminating Extension Group | 1–32                           |
| Route Pattern               | 1–2000                         |
| Class of Restriction        | 0–995                          |
| Uniform Dial Plan           | UDP range                      |

- The roles and permissions also apply to the classic view apart from the Communication Manager objects mentioned.
- Granular RBAC is not applicable when you view the Communication Manager objects by clicking **Element Cut Through**. However, to access **Element Cut Through**, you must have the Element Cut Through permissions.
- When you assign a role to a user, the range permissions are considered along with the operation permissions.
- You must log off and log in for any permission you assign to take effect.

## Implicit permissions required for Communication Manager objects

As a user, you require additional permissions to perform certain actions. The following table specifies the implicit permissions required for performing these actions:

| Steps | Action                                  | Implicit permissions that are required |
|-------|-----------------------------------------|----------------------------------------|
|       | Duplicating an endpoint                 | Add endpoint permission                |
|       | Adding endpoints in bulk                | Add endpoint permission                |
|       | Editing an endpoint extension           | Edit endpoint permission               |
|       | Changing global parameters of endpoints | Edit endpoint permission               |
|       | Swapping endpoints                      | Edit endpoint permission               |
|       | Deleting endpoints in bulk              | Delete endpoint permission             |

*Table continues...*

| Steps                                                                                                                                         | Action                                                                        | Implicit permissions that are required                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Edit a user with the help of the Agent communication profile.</li> <li>Import users in bulk</li> </ul> | Changing an extension with an existing extension                              | Edit permission and delete permission                                                                                                                      |
| <ul style="list-style-type: none"> <li>Edit a user using the Agent communication profile.</li> <li>Import users in bulk</li> </ul>            | Changing an extension with a new extension                                    | Add permission and delete permission                                                                                                                       |
| <ul style="list-style-type: none"> <li>Edit a user using the Agent communication profile.</li> <li>Import users in bulk</li> </ul>            | Changing other fields other than extension                                    | Edit permissions                                                                                                                                           |
| Check the port extension remove option, and assign an endpoint extension to an agent.                                                         | Deleting an endpoint                                                          | Delete agents and add agents permissions                                                                                                                   |
|                                                                                                                                               | Editing agents in bulk                                                        | Edit agents permission                                                                                                                                     |

## Sample scenario for the range feature

When you assign a range for Hunt Group, and go to the **Hunt Group > Switch to Classic View > New** page, the system prompts you to enter a qualifier. You can enter the hunt group number, or type `Next`, and click **Add** to add the next available group number.

- If you enter a group number that is not a part of the assigned range, the system displays an error message.
- If you enter a group number within the assigned range, the system displays the NCM screen, where you can complete the add operation.
- If you enter a group number that is already present, the system displays the `Identifier previously assigned` message.

---

## Assigning permissions in User Management

The range feature in endpoints and agents is also applicable in **User Management**. When you assign a range for endpoints and agents, as per the permissions that are defined, you can add, edit, delete, and duplicate only the extensions that are associated with the user. Range is validated when you assign an endpoint extension or an agent extension through the endpoint or agent editor.

---

## Assigning permissions through User Management

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select an existing role, and perform one of the following:
  - Click **New**
  - Right-click and select **New**.

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

4. On the Add New Role page, type the name and the description for the role.
5. Click **Commit and Continue**.
6. Click **Add Mapping**.
7. In **Group Name**, select the group of templates to which you want to apply this permission.  
You can leave **Group Name** blank if you do not want to select a group.
8. In the **Element or Resource Type** field, click **users**.
9. In the **Element or Resource Instance** field, click **All**.
10. Click **Next**.
11. On the Permission Mapping page, select the **Role Resource Type Action** and **Role Resource Type Attributes**. Enable **Administrative Users**, if required.
12. Click **Commit**.  
The system displays the Role Details page with the permission mapping you created.
13. Click **Add Mapping**.
14. To specify the operation resource type mapping, in the **Element or Resource Type** field, click **operation**.
15. Click **Next** and **Commit**.

---

## Field-level RBAC

System Manager supports field-level RBAC for Communication Manager objects. You can assign permissions for the following Communication Manager objects:

| Communication Manager object | Field                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

 **Note:**

Field-level RBAC is applicable only for the Edit operation.

Field-level RBAC is not applicable when you add Communication Manager objects.

## Endpoints

### Range in endpoints

You can assign a range of values in endpoints and add permissions for specific fields in an endpoint. Specify a definite range, comma separated values, or a single value in the endpoints range field.

For example, you can type 5600:6000 to assign permissions for extensions 5000 to 6000. When you use colon (:) to specify the extension range, the starting and the ending extensions must have the same number of digits.

When you enter comma separated values like 1, 3, 7, 9, and 45, you assign the permissions only to these specified extensions.

 **Note:**

Enter \* in the **Range** field, to assign the permissions for the entire extension range.

- If you assign a specific endpoint range to a user, you can view, add, delete, edit and duplicate only those endpoints within the specified range.
- You can also assign a specific range to the **COR** and **Coverage Path** fields in endpoints.
- You can manage only those endpoint extensions within the specified range.
- For a user, you can assign only those extensions that you specify in the CM Endpoint Communication Profile. For example, if you assign the range 100:200 to user A, and user A

adds an endpoint with extension 201, the system displays an error message and the endpoint add job fails.

## Assigning range for endpoints

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select an existing role, and do one of the following:
  - Click **New**
  - Right-click and select **New**

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

4. On the Add New Role page, type the name and the description for the role.
5. Click **Commit and Continue**.
6. Click **Add Mapping** under **Element/Service Permissions** section.
7. In the **Element or Resource Type** field, click **Communication Manager**.
8. On the Roles page, select an existing role, and do one of the following:
  - Click **New**
  - Right-click and select **New**

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

9. On the Add New Role page, type the name and the description for the role.
10. Click **Commit and Continue**.
11. On the Role Details page, in the **Element/Service Permissions** section, click **Add Mapping**.
12. In the **Element or Resource Type** field, click **Communication Manager**.
13. In **Group Name**, select the group of Communication Manager systems to which you want to apply this permission.  
You can leave **Group Name** blank if you do not want to select any group.
14. In the **Element or Resource Type** field, click **Communication Manager**.
15. In the **Element or Resource Instance** field, click a Communication Manager instance to which you want to apply this permission.  
When you select **Group Name**, System Manager disables this field.
16. Click **Next**.
17. On the Permission Mapping page, expand the **Endpoints** permission list by clicking on the arrow next to it. Enter the range you want to specify in the **Extension Range** field.  
You can specify a definite range, enter comma separated values, or a single value in endpoints. For example, 5600:6000, 1, 3, 7, 9, and 45.
18. You can also assign operation permissions like **Bulk Add, Bulk Edit, Delete, Edit, List Usage, Swap, List Trace Station**.  
The user can perform only the actions that are assigned in the operation permissions.
19. Click **Commit**.

## Assigning permissions for fields in endpoints

Field-level RBAC for Communication Manager objects is applicable only for the edit operation.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select an existing role, and do one of the following:
  - Click **New**
  - Right-click and select **New**

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

4. On the Add New Role page, type the name and the description for the role.
5. Click **Commit and Continue**.
6. Click **Add Mapping** under **Element/Service Permissions** section.
7. In the **Element or Resource Type** field, click **Communication Manager**.
8. On the Roles page, select an existing role, and do one of the following:
  - Click **New**
  - Right-click and select **New**

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

9. On the Add New Role page, type the name and the description for the role.
10. Click **Commit and Continue**.
11. On the Role Details page, in the **Element/Service Permissions** section, click **Add Mapping**.
12. In the **Element or Resource Type** field, click **Communication Manager**.
13. In **Group Name**, select the group of Communication Manager systems to which you want to apply this permission.  
You can leave **Group Name** blank if you do not want to select any group.
14. In the **Element or Resource Type** field, click **Communication Manager**.
15. In the **Element or Resource Instance** field, click a Communication Manager instance to which you want to apply this permission.  
When you select **Group Name**, System Manager disables this field.
16. Click **Next**.
17. On the Permission Mapping page, expand **Endpoint Attributes Permission for Edit Operation** and **Endpoint Buttons Permission for Edit Operation** by clicking on the arrow next to it. Select the buttons and attributes that you want to assign to this role.
18. Click **Commit**.

If you assign this role to a user, the user can edit only the fields that you have assigned in the Permission Mapping page.

# Hunt Group

## Assigning range for hunt group

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select an existing role, and do one of the following:
  - Click **New**
  - Right-click and select **New**

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

4. On the Add New Role page, type the name and the description for the role.
5. Click **Commit and Continue**.
6. Click **Add Mapping** under **Element/Service Permissions** section.
7. In the **Element or Resource Type** field, click **Communication Manager**.
8. On the Roles page, select an existing role, and do one of the following:
  - Click **New**
  - Right-click and select **New**

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

9. On the Add New Role page, type the name and the description for the role.
10. Click **Commit and Continue**.
11. On the Role Details page, in the **Element/Service Permissions** section, click **Add Mapping**.
12. In the **Element or Resource Type** field, click **Communication Manager**.
13. In **Group Name**, select the group of Communication Manager systems to which you want to apply this permission.  
You can leave **Group Name** blank if you do not want to select any group.
14. In the **Element or Resource Type** field, click **Communication Manager**.
15. In the **Element or Resource Instance** field, click a Communication Manager instance to which you want to apply this permission.  
When you select **Group Name**, System Manager disables this field.
16. Click **Next**.
17. On the Permission Mapping page, expand the **Hunt Group** permission list by clicking on the arrow next to it. Enter the range you want to specify in the **Group Number Range** and **Group Extension Range** fields.  
You can specify a definite range, enter comma separated values, or \* for all extensions.
18. You can also assign operation permissions like **Add**, **Edit**, **Delete**, **List Usage**, and **View**.  
The user can perform only the actions that are assigned in the operation permissions.
19. Click **Commit**.

## Assigning permissions for fields in hunt group

Field-level RBAC for Communication Manager objects is applicable only for the edit operation.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select an existing role, and do one of the following:
  - Click **New**
  - Right-click and select **New**

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

4. On the Add New Role page, type the name and the description for the role.
5. Click **Commit and Continue**.
6. Click **Add Mapping** under **Element/Service Permissions** section.
7. In the **Element or Resource Type** field, click **Communication Manager**.
8. On the Roles page, select an existing role, and do one of the following:
  - Click **New**
  - Right-click and select **New**

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

9. On the Add New Role page, type the name and the description for the role.
10. Click **Commit and Continue**.
11. On the Role Details page, in the **Element/Service Permissions** section, click **Add Mapping**.
12. In the **Element or Resource Type** field, click **Communication Manager**.
13. In **Group Name**, select the group of Communication Manager systems to which you want to apply this permission.  
You can leave **Group Name** blank if you do not want to select any group.
14. In the **Element or Resource Type** field, click **Communication Manager**.
15. In the **Element or Resource Instance** field, click a Communication Manager instance to which you want to apply this permission.  
When you select **Group Name**, System Manager disables this field.
16. Click **Next**.
17. On the Permission Mapping page, expand the **Hunt Group Attributes Permission for Edit Operation** list by clicking on the arrow next to it. Select the attributes that you want to assign to this role.
18. Click **Commit**.

If you assign this role to a user, the user can edit only the fields that you have assigned in the Permission Mapping page.

# Trunk Group

## Assigning permissions for fields in trunk group

Field-level RBAC for Communication Manager objects is applicable only for the edit operation.

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select an existing role, and do one of the following:
  - Click **New**
  - Right-click and select **New**

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

4. On the Add New Role page, type the name and the description for the role.
5. Click **Commit and Continue**.
6. Click **Add Mapping** under **Element/Service Permissions** section.
7. In the **Element or Resource Type** field, click **Communication Manager**.
8. On the Roles page, select an existing role, and do one of the following:
  - Click **New**
  - Right-click and select **New**

The role that you selected becomes the parent of the role that you create. The permissions available to the new role limit to the permissions of the parent role.

9. On the Add New Role page, type the name and the description for the role.
10. Click **Commit and Continue**.
11. On the Role Details page, in the **Element/Service Permissions** section, click **Add Mapping**.
12. In the **Element or Resource Type** field, click **Communication Manager**.
13. In **Group Name**, select the group of Communication Manager systems to which you want to apply this permission.  
You can leave **Group Name** blank if you do not want to select any group.
14. In the **Element or Resource Type** field, click **Communication Manager**.
15. In the **Element or Resource Instance** field, click a Communication Manager instance to which you want to apply this permission.  
When you select **Group Name**, System Manager disables this field.
16. Click **Next**.
17. On the Permission Mapping page, expand the **Trunk Group** permission list by clicking on the arrow next to it. Select the attributes that you want to assign to this role.
18. Click **Commit**.

If you assign this role to a user, the user can edit only the fields that you have assigned in the Permission Mapping page.

# Chapter 7: Managing users, public contacts, and shared addresses

---

## Managing users

---

### Users, public contacts, and shared addresses

#### Manage users

User Management is a shared service that users can gain access from the System Manager web console. User Management supports a logically centralized data store. Applications can gain access to this data store and get the user information that applications need. Administrators or end users do not need to enter user information for each application.

User Management provides administrators with mechanisms to:

- Administer all user attributes, contact information, group membership, user provisioning rule assignment, organization hierarchy assignment, and role assignment, also product-specific user data.
- For each product, extend the underlying user model for product-specific properties, attributes, and any relationship between the attributes.
- Manage specific aspects of user data such as changing a user name or address.

Using User Management, you can:

- Add user profiles.
- View, change, and delete existing user profiles.
- Assign or remove permissions, roles, groups, addresses, and contacts for users.
- Assign user provisioning rule and organization hierarchy.
- Add and change the communication profile of users.
- Change the identity and communication profile data of users in bulk.
- Bulk import users and their attributes, public contact, and shared addresses from an XML file.  
Bulk import users and their attributes from an Excel file.
- Bulk export users and their attributes to an XML and Excel file from the System Manager web console and command line interface.
- Search users.

User Management uses data synchronization to achieve a single-point user administration. User Management synchronizes the user data event that the system generates at the application level with the central user space and other connected applications. If an enterprise directory is connected, then User Management maintains synchronization at the enterprise level. User Management directly adjusts to the changes that occur in the enterprise directory, specifically additions, deletions, and modifications. For more information, see the Directory synchronization overview section.

Roles based access control (RBAC) applies to User Management so that the user role determines the access to user level tasks and access to administrative tasks. Users with login privileges must have permissions to add, change, and delete user accounts on the management console.

To perform the user provisioning by using User Management, map the user to the role with the following permissions:

| Resource type                 | Permissions                 |
|-------------------------------|-----------------------------|
| All elements of type:elements | add, delete, edit, and view |

To perform the user provisioning by using the user provisioning rule, map the user to the role with the following permissions:

| Resource type                 | Permissions |
|-------------------------------|-------------|
| All elements of type:elements | view        |

### Manage public contacts

As an administrator, you can define public contacts of users in System Manager for an enterprise. You can share public contacts by all users in System Manager.

### Manage shared address

All users in the enterprise can share the common addresses called shared address. As an administrator, you can create, change, and delete a shared address of users in the enterprise.

---

## Access to administrative users

Starting from System Manager Release 6.3.8, when you create a role with access to **User Management**, you can restrict the access to the Administrative Users page.

The roles that are created earlier than Release 6.3.8 with permissions to access **User Management** can access the Administrative Users page by default. The roles continue to have permission after the upgrade to Release 6.3.8 or later. To restrict access to the Administrative Users page, clear the **Allow access to Administrative Users Web UI** check box on the Permission Mapping page.

To gain access to the Administrative Users page, log on to the System Manager web console and click the **Users > Administrators** link. The Administrative Users page displays the list of administrative users that are available in the system. By default, when you add user-related permissions to a role, the system selects the **Allow access to Administrative Users Web UI** permission.

---

## End user self provisioning

Using the URL that administrator provides, end users can access the Self Provisioning web interface to change or reset the communication profile password.

End users can start the self provisioning interface from any device that supports a web browser. For example, from a web browser on the computer, mobile phone, and notebook.

By default, **Self Provisioning Status** is set to **true** so that the end user can change the communication profile password.

[Changing the communication profile password from the self provisioning interface](#) on page 223

---

## Enabling self provisioning

### About this task

Administrator must disable self provisioning on System Manager for the end user to change the communication profile password.

### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Settings > SMGR**.
3. On the Edit Profile:SMGR page, set **Self Provisioning Status** to **true**.
4. Click **Commit**.

---

## Disabling self provisioning

### About this task

Administrator must disable self provisioning on System Manager so that the end user cannot change the communication profile password.

### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. In the navigation pane, click **Settings > SMGR**.
3. On the Edit Profile:SMGR page, set **Self Provisioning Status** to **false**.

If you set the status to false, the system displays the following message: The provisioning application is currently disabled. Please contact your system administrator.

[Changing the communication profile password from the self provisioning interface](#) on page 223

---

## Generating the communication profile password from the self provisioning interface

### About this task

Use this procedure to reset only the Communication Profile password.

### Before you begin

The System Manager administrator must do the following:

- Enable Self Provisioning. For more information, see “Enabling self provisioning”.
- Configure email properties. For more information, see “Configuring email properties”.
- Add the user’s email address in the user profile. For more information, see “User Profile Edit field descriptions”.

### Procedure

1. To gain access to the Self Provisioning web interface, on the web browser, type `https://<IP address of System Manager>/selfprovisioning/`.
2. On the Login page, type the user’s Avaya SIP handle and click **Reset Password**.

#### **Note:**

Avaya SIP handle is in the following format: `handle@domain`.

3. Access the inbox of the email address associated with the provided Avaya SIP handle.
4. In the **Avaya Aura System Manager Password Reset** email, click on the password activation link.

The system sends a new email with a system generated password.

### Next steps

Change the system generated communication profile password. For more information, see “Changing the communication profile password from the self provisioning interface”.

### Related links

[Disabling self provisioning](#) on page 221

[Changing the communication profile password from the self provisioning interface](#) on page 223

---

## Changing the communication profile password from the self provisioning interface

### About this task

Using this procedure, the end user can change the communication profile password from the Self Provisioning web interface.

When the system is overloaded, the Self Provisioning web interface displays the message The Provisioning Application has reached maximum supported load. Please try again after some time.

### Before you begin

The System Manager administrator must Enable Self Provisioning. For more information, see “Enabling self provisioning”.

### Procedure

1. To gain access to the Self Provisioning web interface, on the web browser, type `https://<IP address of System Manager>/selfprovisioning/`.
2. On the Login page, type the user ID and password and click **Login**.

#### **Note:**

- Use the communication address as username and communication profile password or SIP password as password.
  - For users with Communication Manager communication profile, use the Communication Manager extension and security password.
  - Do not leave the user name and password fields blank.
3. On the Password Change for Communication Profile page, in the **Profile Type** field, click one of the following:
    - **SIP**
    - **H.323**
    - **Agent**
    - **Messaging**

### Password Change for Communication Profile

**Profile Type**

**Current Password**

**New Password**

**Confirm New Password**

Submit

Clear

4. Type the current password and the new password, and do one of the following:
  - To clear the values, click **Clear**.
  - To change the password, click **Submit**.

#### Related links

[Disabling self provisioning](#) on page 221

---

## Viewing details of a user

### Before you begin

You require appropriate permissions.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user.
3. To view details of the selected user account, click **View**.

 **Note:**

You can only view details of one user account at a time.

#### Related links

[User Profile | View | <User Name> field descriptions](#) on page 333

## Creating a new user account

You can create new user account using this section or by providing the user provisioning rule.

### Before you begin

- You require permission to add a new user account.
- The role must have the following permissions assigned:

For resource type elements, all permissions in the **Role Resource Type Actions** section.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, click **New**.
3. On the User Profile | Add page, complete the following steps:

- a. **(Optional)** In the **Organization** section, select a tenant from the **Tenant** field.

You must select a tenant only if the user must belong to a tenant.

- b. **(Optional)** On the **Identity** tab, in the Basic Info section, in the **User Provisioning Rule** field, select a user provisioning rule.

You can provide only one user provisioning rule.

#### **Note:**

When you use the user provisioning rule to create a user, the system populates the values of user attributes from the user provisioning rule.

- c. Enter the required information in the remaining fields.

4. Perform one of the following:

- To save the changes, click **Commit**.
- To save the changes and stay on the same page, click **Commit & Continue**.

Before you click **Commit**, ensure that all mandatory fields have valid information.

#### **Important:**

The Communication Manager systems that are undergoing synchronization or are busy, displays the following behavior:

- In Firefox, the system displays the status of the Communication Manager systems that are undergoing synchronization as disabled. The Communication Manager systems are available only after the synchronization is complete. To view the Communication Manager systems, you must start the new user operation again.
- In Internet Explorer, the system does not display the Communication Manager systems that are undergoing synchronization in the list. The Communication

Manager systems are available only after the synchronization is complete. To view the Communication Manager systems, you must start the new user operation again.

## Creating a new user profile using the user provisioning rule

### Before you begin

Ensure that the role has the following permissions:

For resource type elements, all permissions in the **Role Resource Type Actions** section.

### About this task

When you use the user provisioning rule to create a user, the system populates the values of user attributes from the user provisioning rule.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, click **New**.
3. On the User Profile | Add page, complete the following fields:

- **User Provisioning Rule**

You can provide only one user provisioning rule.

- **Last Name**

- **First Name**

- **Login Name**

4. Perform one of the following:

- To save the changes, click **Commit**.
- To save the changes and stay on the same page for making further changes, click **Commit & Continue**.

Before you click **Commit**, ensure that all mandatory fields contain valid information.

The system creates the user with attributes that are defined in the user provisioning rule.

## Results of using the user provisioning rule

You can expect the following results when you provision the user using the user provisioning rule.

| Provisioning method | Scenario                                                                                                                                                                               | Expected result                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                     | The user provisioning rule is not associated with the existing user. The new user provisioning rule values are configured in LDAP for the user.                      | User synchronization fails if the communication profile exists for the user and the same profile is present in the new user provisioning rule that is configured in LDAP.<br><br>If no conflicts in communication profile, the system merges the communication profile with the existing communication profile and the new user provisioning rule that you select. |
|                     | The communication profile that is created using the user provisioning rule exists for the user, and the value of the user provisioning rule is set to blank in LDAP. | The system disassociates the user provisioning rule with the user. The communication profiles that are created using the user provisioning rule remain unchanged.                                                                                                                                                                                                  |

## Modifying user accounts

### Before you begin

- You require permissions to modify the user details. If you select a user that does not have the permission to modify the details, the system does not display the **Edit** button.
- The role must have the following permissions assigned:  
For resource type elements, all permissions in the **Role Resource Type Actions** section.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user.

#### **Note:**

At one time, you can edit only one user account.

3. To edit a user account, click one of the following:
  - **Edit**.
  - **View > Edit**.
4. On the User Profile | Edit | <User Name> page, do the following:
  - a. **(Optional)** In the **Organization** section, select a tenant from the **Tenant** field.  
You must select a tenant only if the user must belong to a tenant.
  - b. **(Optional)** On the **Identity** tab, in the Basic Info section, in the **User Provisioning Rule** field, select a user provisioning rule.  
You can provide only one user provisioning rule.

 **Note:**

When you use the user provisioning rule to create a user, the system populates the values of user attributes from the user provisioning rule.

- c. Enter the required information in the remaining fields.

For information, see “User Profile | Edit | <User Name> field descriptions”.

- You cannot edit the tenant. If you select a different level 1 for the tenant from the organization hierarchy, the **Level 2** and **Level 3** fields become blank. You can select new values for level 2 and level 3. If you select a different level 2 for the tenant from the organization hierarchy, the **Level 3** field becomes blank. You can select a new value for level 3.
- If you must change the tenant, delete the user and associate the user with the tenant.
- System Manager does not automatically modify the user if the user provisioning rule changes.
- You can select a different user provisioning rule when you modify the user information.

 **Note:**

You can associate the user to an existing tenant.

5. Perform one of the following:

- To save the changes, click **Commit**.
- To save the changes and stay on the same page, click **Commit & Continue**.

## Creating duplicate users

You can duplicate the user details to create a new user account by copying information from an existing user account. Using the Duplicate feature, you cannot copy the confidential information, such as addresses, private contacts and associated contacts in the contact list, password, and login name of the user.

Using the Duplicate feature, you can also copy the communication profiles like CM Endpoint and Session Manager. However, you cannot copy CS 1000 Endpoint Profile. You must add the CS 1000 Endpoint Profile after you create a duplicate user.

### Before you begin

You require permission to copy the user details.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.

2. On the Manage Users page, select the user account that you must duplicate.
3. Click **Duplicate**.
4. On the User Profile | Duplicate | <User Name> page, enter the appropriate information.
5. Perform one of the following:
  - To save the changes, click **Commit**.
  - To save the changes and stay on the same page, click **Commit & Continue**.

---

## Removing user accounts

### About this task

When you remove a user, the system marks the user as deleted and saves the user in a list of deleted users. The system removes the roles associated with the user. However, the contacts, addresses, and communication profiles of the user still exist in the database. You can permanently remove the deleted users from the database.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select one or more users from the table, and click **Delete**.
3. On the User Delete Confirmation page, click **Delete**.

#### **Note:**

You cannot delete users:

- With the login name *admin* from the Manage Users page.
- Synchronized from LDAP.

## Removing the deleted users from the database

Using this procedure, you can permanently delete a user from the database.

### Before you begin

Ensure you have the permission to delete the selected user.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, click **More Actions > Show Deleted Users**.
3. On the Show Deleted Users page, select the users to delete, and click **Delete**.

4. On the User Delete Confirmation page, click **Delete**.

## Editing users in bulk

### About this task

On the System Manager web console, you can change the identity and communication profile data of users in bulk.

#### **Note:**

With **Bulk Edit Users**, you can select multiple users and create or update the communication profile data for the users. However, you cannot delete communication profiles.

While performing bulk edit operation, you do not validate the details of the users because bulk operation impacts all users.

You can schedule the bulk edit job to run at a later time.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. Select one or more users and click **More Actions > Bulk Edit Users**.
3. On the User Bulk Editor page, in the **Basic** and **Communication Profile** tabs, change the fields as appropriate.  
  
When you provide the communication profile password during the bulk edit of users, the system overwrites the existing communication profile password of the user.
4. Click **Run Now** or **Schedule**.
5. To view the status of the bulk edit job, click **More Actions > Status of Bulk Edit Users Jobs**.

For more information, see Viewing bulk user edit jobs.

---

## Viewing bulk user edit jobs

### Before you begin

Create a bulk user edit job and run the job.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.

2. Click **More Actions > Status of Bulk Edit Users Jobs**.
3. On the Schedule Bulk Edit of Users page, select a bulk edit job and click **View**.  
The system displays job details on the Bulk Edit Job Details page.
4. To view any latest changes in job details, click **Refresh**.

---

## Deleting the bulk user edit job

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. Click **More Actions > Status of Bulk Edit Users Jobs**.
3. On the Schedule Bulk Edit of Users page, select one or more bulk edit jobs and click **Delete**.
4. On the Filter Profile Delete Confirmation page, click **Delete**.

The system deletes the bulk edit job.

---

## Create new profile option

During add and edit profile operations, based on the selection of the **Create New Profile if it doesn't exist for the user** check box and the availability of the communication profile, System Manager provides the following:

| Create New Profile if it doesn't exist for the user check box | Communication profile | Add operation                                                        | Edit operation                                                              |
|---------------------------------------------------------------|-----------------------|----------------------------------------------------------------------|-----------------------------------------------------------------------------|
| Selected                                                      | Exists                | You cannot update the existing communication profile.                | The profile remains unchanged.                                              |
| Selected                                                      | Does not exist        | The system creates the communication profile.                        | The profile remains unchanged.                                              |
| Not selected                                                  | Exists                | The communication profile that is already created remains unchanged. | The system updates the communication profile based on the changes you make. |
| Not selected                                                  | Does not exist        | No change because you have not selected the check box.               | No change. You cannot update a communication profile that does not exist.   |

## User Provisioning Rules and User Bulk Editor

You can edit the users in bulk from one of the following:

- On the User Provisioning Rules page, from the **User Provisioning Rule** link. For more information, see [User Provisioning Rule field descriptions](#) on page 619.
- On the User Bulk Editor page, from the **User Management > Manage Users > More Actions > Bulk Edit Users** link. For more information, see [User Bulk Editor field description](#) on page 235.

## User Bulk Editor field descriptions

### Basic

 **Note:**

On the **Basic** tab, when you provide the value in a field, the system applies the same value for all selected users.

| Name                                                | Description                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Name                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Communication Profile Password</b>                 | <p>The communication profile password.</p> <p>The field is available only if you enable the communication profile. The password policy is configured on the <b>Users &gt; User Management &gt; Communication Profile Password Policy</b> page.</p> <p>When you provide the communication password value during bulk edit of users, the system overwrites any existing communication profile passwords of the user.</p>                                                                                      |
| <b>Edit</b>                                           | <p>The link to change the Communication Profile password.</p> <p>When you click the <b>Edit</b> link, the system displays the <b>Confirm Password</b> field along with the <b>Generate</b> and <b>Cancel</b> links.</p>                                                                                                                                                                                                                                                                                     |
| <b>Confirm Password</b>                               | The communication profile password that you reenter for confirmation.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Generate</b>                                       | <p>The option to automatically generate the communication profile password.</p> <p>System Manager sends the generated password to the user, if:</p> <ul style="list-style-type: none"> <li>• Email configuration properties are set on the <b>Services &gt; Configurations &gt; Settings &gt; SMGR</b> page.</li> </ul> <p>For more information, see “Configuring email properties”.</p> <ul style="list-style-type: none"> <li>• <b>Email Address</b> is configured on the <b>Identity</b> tab.</li> </ul> |
| <b>Cancel</b>                                         | Cancels the password change operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Prefix for Avaya E164 Handle</b>                   | The digits that the system must prefix to the telephone number or Avaya E.164 handle. The default is plus (+).                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Language Preference</b>                            | The preferred written or spoken language of the user. For example, English.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Time Zone</b>                                      | The preferred time zone of the user. For example, (+05:30) Chennai, Kolkata, Mumbai, New Delhi.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Allow H.323 and SIP Endpoint Dual Registration</b> | <p>The option to register an H.323 endpoint and a SIP endpoint together at the same time to the same extension. For more information about the SIP and H.323 dual registration feature, see <i>Avaya Aura® Communication Manager Feature Description and Implementation</i> on the Avaya Support website at <a href="http://support.avaya.com">http://support.avaya.com</a>.</p>                                                                                                                            |

## Communication Profile: Session Manager Profile

**\* Note:**

The system displays the following fields only if a communication profile of the user exists for the product:

| Name                                                       | Description                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Create New Profile if it doesn't exist for the user</b> | <p>An option to create the profile for the user if a profile does not already exist.</p> <p>The system displays the check box only when you select the communication profile. If the communication profile already exists, the system does not make any changes to the profile data.</p> <p>For more information, see <a href="#">Create new profile option</a> on page 234.</p> |

| Name                             | Description                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Primary Session Manager</b>   | The instance that you want to use as the home server for the currently displayed communication profile. As a home server, the selected primary Session Manager instance is used as the default access point for connecting devices associated with the communication profile to the Avaya Aura <sup>®</sup> network. You must select the primary Session Manager server. |
| <b>Secondary Session Manager</b> | The Session Manager instance that you select as the secondary Session Manager. It provides continued service to SIP devices associated with this communication profile when the primary Session Manager server becomes unavailable. A selection is optional.                                                                                                             |

*Table continues...*

| Name                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Survivability Server</b>                                     | <p>For local survivability, you can specify a survivability server to provide survivability communication services for devices associated with a communication profile when the local connectivity to Session Manager instances in Avaya is lost. If you select Branch Session Manager, and the termination and origination application sequences contain a Communication Manager application, sequencing to this application continues, locally, to Communication Manager survivable remote server resident with Branch Session Manager. A selection is optional.</p> <p> <b>Note:</b></p> <p>If a termination or origination application sequence contains a Communication Manager application, the Communication Manager instance associated with the application must be the main server for the Communication Manager survivable remote server that resides with Branch Session Manager.</p> <p>After typing minimum of 3 characters, wait for three seconds to capture the final keyword, and fetch the required results.</p> |
| <b>Max. Simultaneous Devices</b>                                | <p>The maximum number of endpoints that you can register at a time by using this communication profile. If you register more than one endpoint, all the endpoints receive calls simultaneously.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Block New Registration When Maximum Registrations Active</b> | <p>If you select the check box and an endpoint attempts to register using this communication profile after the registration requests exceed the administered limit, the system denies any new registrations with Session Manager. The system sends a warning message and stops the SIP service to the endpoint.</p> <p> <b>Note:</b></p> <p><b>Block New Registration When Maximum Registrations Active</b> is available only when you select the <b>Create New Profile if it doesn't exist for the user</b> check box while creating the user profile.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

*Table continues...*

| Name                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Origination Application Sequence</b> | <p>The application sequence that the system invokes when routing calls from this user. A selection is optional.</p> <p> <b>Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p> |
| <b>Termination Application Sequence</b> | <p>The application sequence that is invoked when the system routes calls to this user. A selection is optional.</p> <p> <b>Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p> |
| <b>Home Location</b>                    | <p>The home location to support mobility for the currently displayed user. Session Manager uses the home location specifically when the IP address of the calling phone does not match the IP Address Pattern of any location. You must specify a value.</p>                                                                                                                                                                        |
| <b>Conference Factory Set</b>           | <p>The conference factory set to enable media capability-based call routing to the Conferencing SIP entities.</p> <p>Use the <b>Session Manager &gt; Application Configuration &gt; Conference Factories</b> webpage to administer the Conference Factory Sets.</p>                                                                                                                                                                 |

### Communication Profile tab: Avaya Breeze® platform Profile

| Name                                                       | Description                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Create New Profile if it doesn't exist for the user</b> | <p>An option to create the profile for the user if a profile does not already exist.</p> <p>The system displays the check box only when you select the communication profile. If the communication profile already exists, the system does not make any changes to the profile data.</p> <p>For more information, see <a href="#">Create new profile option</a> on page 234.</p> |

| Name                   | Description                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Service Profile</b> | The profile that you assign to the user. The user can gain access to the service contained in the profile. |

### Communication Profile: CM Endpoint Profile

| Name                                                       | Description                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Create New Profile if it doesn't exist for the user</b> | <p>An option to create the profile for the user if a profile does not already exist.</p> <p>The system displays the check box only when you select the communication profile. If the communication profile already exists, the system does not make any changes to the profile data.</p> <p>For more information, see <a href="#">Create new profile option</a> on page 234.</p> |

By default, the system displays only **Profile Type**, **Template**, **Security Code**, and **Preferred Handle** fields. The system displays the remaining fields only when you select the **Create New Profile if it doesn't exist for the user** check box while creating the communication profile.

| Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Next Available Extension</b> | <p>The option to instruct the system to create a new extension for the user.</p> <p> <b>Note:</b></p> <p>For LDAP synchronization, the value in the <b>Use Phone Number last ..... digits for Extension</b> field takes priority.</p>                                                                      |
| <b>Template</b>                     | The template, system defined or user defined, that you associate with the endpoint. Select the template based on the set type you add.                                                                                                                                                                                                                                                        |
| <b>Sub Type</b>                     | This field is configured for CS 1000 station types only. You can select the specific set for <b>Set Type</b> . On the Manage Endpoint page, <b>Sub Type</b> is labeled as <b>Set</b> .                                                                                                                                                                                                        |
| <b>System ID</b>                    | <p>This field is configured for CS 1000 station types only. This field allows you to leave the field blank or enter a string of up to 9 characters. With Release 8.0 more than one station can use the combination of <b>System ID</b> and <b>Terminal Number</b>.</p> <p>With Release 8.0.1, each station must have a unique combination of <b>System ID</b> and <b>Terminal Number</b>.</p> |
| <b>Security Code</b>                | The security code for authorized access to the endpoint.                                                                                                                                                                                                                                                                                                                                      |

*Table continues...*

| Name                                                  | Description                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Preferred Handle</b>                               | Avaya SIP or Avaya E.164 handle that is administered for the user. The field is optional. By default, the field is blank.                                                                                                                                                                                                                                                  |
| <b>Password</b>                                       | The password to gain access to the endpoint.<br><br>The system displays the field if you select <b>Agent</b> in <b>Profile Type</b> .                                                                                                                                                                                                                                      |
| <b>Allow H.323 and SIP Endpoint Dual Registration</b> | The option to register an H.323 endpoint and a SIP endpoint together at the same time to the same extension. For more information about the SIP and H.323 dual registration feature, see <i>Avaya Aura® Communication Manager Feature Description and Implementation</i> on the Avaya Support website at <a href="http://support.avaya.com">http://support.avaya.com</a> . |

### Communication Profile: CS 1000 Endpoint Profile

The communication profile is available only for creating a user profile.

| Name                                                       | Description                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Create New Profile if it doesn't exist for the user</b> | An option to create the profile for the user if a profile does not already exist.<br><br>The system displays the check box only when you select the communication profile. If the communication profile already exists, the system does not make any changes to the profile data.<br><br>For more information, see <a href="#">Create new profile option</a> on page 234. |

| Name                                                     | Description                                                                                                                               |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                                            | The system that will be the element manager of the CS 1000 endpoint profile. You must select the system.                                  |
| <b>Target</b>                                            | The phone or endpoint template that you can choose for the user. The element manager maintains all templates. You must select a template. |
| <b>Template</b>                                          | The phone or endpoint template that you can choose for the user. The element manager maintains all templates. You must select a template. |
| <b>Include in Corporate Directory</b>                    | The option to add this profile to the CS 1000 Corporate Directory feature.                                                                |
| <b>Delete Endpoint on Unassign of Endpoint from User</b> | An option to specify whether to delete the endpoint from the CS 1000 system when you unassign the endpoint from the user.                 |

## Communication Profile: Messaging Profile

| Name                                                       | Description                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Create New Profile if it doesn't exist for the user</b> | <p>An option to create the profile for the user if a profile does not already exist.</p> <p>The system displays the check box only when you select the communication profile. If the communication profile already exists, the system does not make any changes to the profile data.</p> <p>For more information, see <a href="#">Create new profile option</a> on page 234.</p> |

By default, the system displays only **Template** and **Password** fields. The system displays the remaining fields only when you select the **Create New Profile if it doesn't exist for the user** check box while creating the communication profile.

| Name                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                       |

| <b>SIP Entity</b>                          | The option to route the SIP-based messages through Presence Services.<br><br>This system selects the SIP entity only if you select a Presence Services instance in the <b>System</b> field. <b>SIP Entity</b> is read-only. If the system cannot identify a SIP entity, an appropriate error message is displayed in the field.                                                         |
| <b>IM Gateway SIP Entity</b>               | The Presence Services instance for the user.                                                                                                                                                                                                                                                                                                                                            |
| <b>Publish Presence with AES Collector</b> | The option that determines if Presence Services must publish presence with AES Collector. The options are: <ul style="list-style-type: none"> <li>• <b>System Default</b></li> <li>• <b>Off</b></li> <li>• <b>On</b></li> </ul> The default is <b>System Default</b> . You can change the default value. You do not require to configure AES Collector in the Presence Services server. |

### Communication Profile: IP Office Profile

| Name                                                       | Description                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Create New Profile if it doesn't exist for the user</b> | An option to create the profile for the user if a profile does not already exist.<br><br>The system displays the check box only when you select the communication profile. If the communication profile already exists, the system does not make any changes to the profile data.<br><br>For more information, see <a href="#">Create new profile option</a> on page 234. |

By default, the system displays only **Extension**, **Template**, and **Set Type** fields. The system displays the remaining fields only when you select the **Create New Profile if it doesn't exist for the user** check box for creating the communication profile.

| Name             | Description                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>    | The list of IP Office device names from which you can select the IP Office device that you associate with the user. You must select the template.                                                                                                                                                                                                               |
| <b>Extension</b> | The extension of the endpoint to which you associate the profile. The options are: <ul style="list-style-type: none"> <li>• Use CM Extension: Use this option only if Communication Manager profile is specified.</li> <li>• Use Next Available Extension: Use this option if the system must use the next extension to associate with this profile.</li> </ul> |

*Table continues...*

| Name            | Description                                                                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Template</b> | A list of user templates from which you can select a template to set the user configurations.                                                                                        |
| <b>Set Type</b> | The set type for the IP Office endpoint profile. By default, the <b>Set Type</b> field is disabled. If you select a template, the system automatically populates the set type value. |

### Communication Profile: Conferencing Profile

The communication profile is available only for creating a user profile.

| Name                                                       | Description                                                                                                                                                                                                                                                                                                                                                                      |

## Filtering users

### About this task

You can apply filter to the following user information:

- First Name
- Surname
- Display Name
- Login Name
- SIP Handle

You can apply one or more filters to view users that match the filter criteria. Table filter works based on “starts with” mechanism.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.

2.

On the Manage Users page, click the **Filter menu** icon  displayed next to the column according to which you want to filter.

3. Enter the information for one or more of the following filter criteria:

- To filter users by the first name, in the **First Name** column, enter the first name of the user.  
To filter names that begin with a specific letter, enter the letter in the field. You can enter a string of letters to filter the names that begin with the string.
- To filter users by the surname, in the **Surname** column, enter the last name of the user.
- To filter users by the display name, in the **Display Name** column, enter the display name of the user.
- To filter users by the login name, in the **Login Name** column, enter the login name.  
To filter the login names that begin with a specific letter, enter the letter in the field. You can enter a string of letters to filter login names that begin with the string.
- To filter users by the SIP handle, in the **SIP Handle** column, enter the SIP handle (E.164 handle and Avaya SIP Handle) of the user.

4. **(Optional)** To hide the column filters, click **Disable**.

This action does not clear any filter criteria that you had set.

5. Press Enter from keyboard to apply filters.

The table displays the users that match the filter criteria.

6.

To clear the filter criteria, click the **Clear Filter** icon  displayed on the lower-right corner of the table.

## User searchable fields

System Manager supports user search for **User Management** objects.

The following table lists the user searchable fields in the search component:

| User Management object | Field Names                                                                               | Supported Actions  |
|------------------------|-------------------------------------------------------------------------------------------|--------------------|
| User                   | User Name, First Name, Last Name, Display Name, Endpoint Display Name, Login Name, Handle | View, Edit, Delete |

### \* Note:

- In the **Search** component, you can find a user match only when the searchable field starts with the search query.

- For handle search, all the handles get concatenated in one string. If you have multiple handles, you can only search using the start of the first handle string.

For information about the search component, see “Search component for Communication Manager objects”.

---

## Searching for users by using Search component

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. In the **Search** component, at the top of the **Manage Users** page, search for users.

---

## Searching for users by using Advanced Search

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, click **Options > Advanced Search** on the upper-right corner of the page.
3. In the Criteria section, do the following:
  - a. In the first field, select the operator.

**Note:**

This field appears dimmed if there is only one search criteria section.

  - b. In the second field, select the search criterion.
  - c. In the third field, enter the condition.
  - d. In the fourth field, enter the search value.
4. To add another search criterion, click plus (+) and repeat Step 3a through Step 3d.  
To delete a search criterion, you must click the **Delete** icon. The system displays this icon when more than one search criterion is available.
5. Click **Apply Filter**.  
The **Users** table lists the users that match the search criteria.

---

## Assigning roles to a user

To provide access to resources, you must assign roles to users. Use this procedure to assign an admin role to an end user. You can assign up to 20 roles per user.

You can also assign roles to users by using the Roles page, on the System Manager web console. During the tenant administration, the **Membership** tab is unavailable for the tenant administrator.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, perform one of the following:
  - To assign roles while setting up a new user account, click **New**.
  - To assign roles to an existing user, select the user and click **Edit** or **View > Edit**.
3. On the User Profile | Edit | <User Name> or User Profile | Add page, click the Membership tab.
4. Click **Assign Roles**.
5. In the Assign Roles section, select the roles.
6. To assign the roles to the selected user, click **Select**.
7. On the User Profile | Edit | <User Name> or User Profile | Add page, click **Commit**.

#### **Note:**

- For a new user, if you assign a role other than the End-User role, the system prompts for the password.
- For an existing user, the system resets the password to match the login name of the user when you:
  - Change the login name.
  - Assign a role other than End-User role and you do not provide a new password.

When the user logs in, the system prompts the user to change the password on the next login.

---

## Assigning roles to multiple users

To provide access to resources, you must assign roles to the user accounts. Use this procedure to assign admin role to an end user.

You can also assign roles to the users using the Roles service provided by System Manager. To access the Roles service, click **Groups & Roles > Roles**.

During the tenant administration, the **Membership** tab is unavailable for the tenant administrator.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select the users and click **More Actions > Assign Roles**.
3. On the Assign Roles page, select the roles from the **Available Roles** section.

4. Click **Commit** to assign the roles to the selected users.

---

## Removing roles from a user

### Before you begin

You must have permissions to remove the roles for the user.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user and click **Edit**.
3. On the User Profile | Edit | <User Name> page, click the **Membership** tab.
4. Select the roles you want to remove and click **UnAssign Roles**.

You can also assign roles to users using the Roles functionality in System Manager. To access Roles, on the System Manager console, click **Groups & Roles > Roles**

5. Click **Commit** to save the changes.

 **Note:**

You can also assign roles to users using the Roles functionality in System Manager. To access Roles, on the System Manager console, click **Groups & Roles > Roles**.

6. Perform one of the following:
  - To save the changes, click **Commit**.
  - To save the changes and stay on the same page, click **Commit & Continue**.

---

## Assigning groups to a user

You can also assign groups to users using the groups functionality in System Manager. To gain access to **Groups**, on System Manager web console, click **Groups & Roles > Groups**.

During the tenant administration, the **Membership** tab is unavailable for the tenant administrator.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, perform one of the following steps:
  - To assign groups while setting up a new user account, click **New**.
  - To assign groups to an existing user, select the user and click **Edit**.
3. On the User Profile | Edit | <User Name> page or the User Profile | Add page, click the **Membership** tab.
4. In the Group Membership section, click **Add To Group**.

5. On the Assign Groups page, select the groups from the **Available Groups** section.
6. Click **Select** to assign the groups to the user.
7. Perform one of the following:
  - To save the changes, click **Commit**.
  - To save the changes and stay on the same page, click **Commit & Continue**.

---

## Assigning groups to multiple users

You can also assign groups to users using the groups functionality in System Manager. To access **Groups**, on System Manager web console, click **Groups & Roles > Groups**.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select the users and click **More Actions > Add To Group**.
3. On the Add to Group page, select the groups from the **Available Groups** section.
4. Click **Commit** to assign groups to the selected users.

---

## Removing a user from groups

You can also assign groups to users using the groups functionality in System Manager. To access **Groups**, on System Manager web console, click **Groups & Roles > Groups**.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, perform one of the following steps:
  - To remove a group in the edit mode, select the user and click **Edit**.
  - To remove a group in the view mode, select the user and click **View > Edit**.
3. On the User Profile | Edit | <User Name> page, click the **Membership** tab.
4. In the Group Membership section, select the groups from which you want to remove the user and click **Remove From Group**.
5. Click **Commit** to save the changes.

---

## Viewing deleted users

### About this task

When you remove a user from the Manage Users page by using the **Delete** option, the system temporarily removes and stores the user in the **Deleted Users** table.

## Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, click **More Actions > Show Deleted Users**.

On the Soft Deleted Users page, the system displays the temporarily deleted users in the Deleted Users table.

---

## Restoring a deleted user

### About this task

Use this procedure to restore a user that you deleted by using the **Delete** option on the Manage Users page.

### Before you begin

Ensure that you have permission to restore the selected deleted user.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, click **More Actions > Show Deleted Users**.
3. On the Soft Deleted Users page, select the user that you want to restore, and click **Restore**.
4. On the User Restore Confirmation page, click **OK**.
5. Click **Commit**.

#### **Note:**

For a restored user, if you assign a role other than End-User, the system prompts for a password.

---

## Assigning users to roles

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. From the list of roles, click the name of the role.
4. On the **Assigned Users** tab, click **Select Users**.

The system displays the list of users.

5. Select the users and click **Commit**.

---

## Unassigning users from role

### Procedure

1. On the System Manager web console, click **Users > Groups & Roles**.
2. In the navigation pane, click **Roles**.
3. On the Roles page, select a role and click **Edit**.
4. On the Role Details page, click the **Assigned Users** tab.
5. Click **Selected Users**.
6. On the Assigned Users page, clear the check box of the user whom you want to unassign.
7. Click **Commit**.

---

## Managing addresses

### Adding a user address

#### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, do one of the following:
  - To add an address for a new user account, click **New > Identity > Address > New**.
  - To add a new address for an existing user, select the user and click **Edit > Identity > Address > New**.
3. On the Add/Edit Address page, enter the address details.
4. Click **OK** to add the address.
5. Perform one of the following:
  - To save the changes, click **Commit**.
  - To save the changes and stay on the same page, click **Commit & Continue**.

#### Related links

[Add Address field descriptions](#) on page 256

### Editing an address

#### About this task

Use this procedure to modify the address of a user. Note that you cannot edit a shared address.

#### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.

2. On the Manage Users page, select a user, and click **Edit > Identity > Address**.
3. In the **Address** area, select the mailing address that you want to modify and click **Edit**.

You cannot modify a shared address by using this feature.

4. On the Add/Edit Address page, modify the information.
5. Click **OK**.
6. Click **Commit**.

## Deleting an address

### About this task

Use this procedure to delete a private mailing address from the database.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. Do one of the following :
  - If you are on the User Profile | Add page or on the User Profile | Duplicate | <User Name> page and have added an address, then navigate to **Identity > Address**.
  - On the Manage Users page, select a user and click **Edit > Identity > Address**.

3. Select the address that you want to delete and click **Delete**.

If the address that you delete is a shared address, the system removes the address from the address list of the user, but not from the database

4. Perform one of the following:
  - To save the changes, click **Commit**.
  - To save the changes and stay on the same page, click **Commit & Continue**.

## Assigning a shared address to the user

### About this task

Use this procedure to choose a shared address for a user from the common addresses database. You can assign and remove a shared address.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, do one of the following:
  - To assign shared addresses to a new user while creating the user, click **New**.
  - To assign shared addresses to an existing user, select the user, and click **Edit**.
3. On the User Profile | Add page or the User Profile | Edit | <User Name> page, click **Identity > Address > Choose Shared Address**.
4. On the Choose Shared Address page, click one or more shared addresses.

For a new user, enter valid information in all mandatory fields on all tabs of the User Profile | Add page before you click **Commit**. If you enter invalid information, the system displays an error message.

5. Click **Select**.
6. Click one of the following:
  - **Commit**: To save the changes.
  - **Commit & Continue**: To save the changes and stay on the same page for making further modifications.

## Managing communication profiles

### Communication profiles

You can provide communication profiles to associate elements with users. Communication profiles support communication interactions established through Avaya Communication Services.

Communication profiles can be associated to the following entities:

- CM Endpoint
- Messaging
- Avaya Messaging
- Session Manager
- CS 1000
- IP Office
- Presence

- Avaya Breeze® platform
- Conferencing
- Avaya Meetings Server

You can provide communication profiles in User Management through Communication Profile Extension Pack (EP). You can use a communication profile to represent a subscription of the user to a communication subsystem and the specific configuration needs of the user. A communication subsystem is a service or infrastructure that manages the establishment and controls or routes the communication interactions.

System Manager supports maximum five communication profile sets for each user. You can add maximum three CM Endpoint profiles and one Messaging profile for each user, and the remaining two communication profile sets can contain other profiles.

## Adding a communication profile for the user

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, do one of the following:
  - To create a new user account, click **New**.
  - To add a communication profile to an existing user, select the user and click **Edit**.
3. On the User Profile | Add or the User Profile | Edit | <User Name> page, click the **Communication Profile** tab.
4. In the communication profile section, click **New**.
5. In the **Name** field, enter the name of the new communication profile.
6. **(Optional)** To mark the profile as default, select the **Default** check box.
7. Click **Done**.
8. Click **Commit**.

## Deleting the communication profile of a user

### About this task

You cannot delete default communication profiles.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user and click **Edit**.
3. On the User Profile | Edit | <User Name> page, click the **Communication Profile** tab.
4. In the **Communication Profile** section, select a profile.

5. Click **Delete**.
6. Click **Commit**.

### Result

When you delete a communication profile, System Manager deletes all associated communication addresses.

## Creating a new communication address for a communication profile

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, do one of the following :
  - To create a new user account, click **New**.
  - To add a communication profile address to an existing user, select the user and click **Edit**.
3. On the User Profile | Add or User Profile | Edit | <User Name> page, click the **Communication Profile** tab.
4. In the **Communication Profile** section, select a communication profile.
5. In the **Communication Address** section, click **New**.
6. In the **Type** field, enter a communication protocol.
7. In the **Fully Qualified Address** field, enter a contact address in the format supported by the value that you selected in the **Type** field. A contact address can be an e-mail ID, an instant messenger ID, or the SIP address of a SIP-enabled device.
8. Enter the domain name in the field next to **Fully Qualified Address** field.
9. Click **OK**.
10. Click **Commit**.

## Deleting a communication address from a communication profile

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user and click **Edit**.
3. On the User Profile | Edit | <User Name> page, click the **Communication Profile** tab.
4. In the **Communication Profile** section, click a communication profile.
5. In the **Communication Address** section, select a communication address from the table.
6. Click **Delete**.
7. Click **Commit**.

#### Related links

[User Profile | Edit | <User Name> field descriptions](#) on page 315

[User Profile | Add field descriptions](#) on page 295

## Session Manager communication profile administration

In the Session Manager Communication Profile section, you can associate a primary Session Manager instance as a home server for the currently displayed communication profile. As a home server, the selected primary Session Manager instance is used as the default access point for connecting devices associated with the communication profile to the Avaya Aura<sup>®</sup> network.

All communication addresses of type SIP for the communication profile are associated with the Avaya Aura<sup>®</sup> network. If you select a secondary Session Manager instance, Session Manager provides continued service to SIP devices associated with this communication profile when the primary Session Manager is unavailable.

You can configure the system to invoke application sequences when routing calls from (origination application sequence) or to (termination application sequence) the currently displayed user.

You can specify a conference factory set for users for improved voice, video and text conferencing.

For local survivability, you can specify a survivability server to provide survivability communication services for devices associated with a communication profile that is used when local connectivity to Session Manager instances in the Aura core is lost. If you select a Branch Session Manager, and the termination and origination application sequences contain a Communication Manager application, sequencing to this application continues locally to the Communication Manager remote survivable server resident with the Branch Session Manager.

When this user calls numbers that are not associated with an administered user, the system applies dial-plan rules to complete the call based on this home location if the IP address of the SIP device used to make the call is unassigned to a location.

### Related links

[Multi Device Access](#) on page 261

[User Profile | Add field descriptions](#) on page 295

## Multi Device Access

With the Multi Device Access feature, a SIP user can register multiple SIP endpoints with the same extension. You can specify the maximum number of SIP endpoints that can simultaneously register and receive calls in the **Max. Simultaneous Devices** field of the Session Manager communication profile section on the User Profile page. The default is 1. For more information, see *Avaya Aura® Multi Device Access White Paper* on the Avaya Support site at <http://support.avaya.com/>.

If the number of registration requests exceed the administered limit, and if the **Block New Registration When Maximum Registrations Active** field is:

- Cleared, the system accepts the new registration and unregisters the endpoint with the oldest registration. If the endpoint with the oldest registration is active on a call, the system waits for the call to complete before unregistering.
- Selected, the system denies any new registrations and sends the 403 Forbidden response with an appropriate warning header to the registering device.

The system routes incoming INVITE requests or call attempts to all the registered devices for a given user simultaneously. When the caller answers the call, the system cancels the INVITE request to the other devices.

The system routes an incoming CANCEL request to all the registered devices if the caller hangs up before the call is answered.

## Lync integration simplification

In releases earlier than 7.0, for Lync integration, the administrator had to administer the Presence Services handle of an Avaya Aura® user twice as:

1. Avaya Presence/IM (formerly XMPP) handle
2. Avaya SIP handle

The duplicate administration was required for proper routing of the Lync originated subscription and IM requests.

Starting with Session Manager Release 7.0, the Presence Services handle is administered only once.

To support tighter integration with Microsoft Lync, Session Manager:

- Supports routing rules, configured in System Manager, to deliver Lync Presence/IM traffic to Presence and Avaya Multimedia Messaging as appropriate.
- Recognizes and routes on the Presence/IM handle type.

- Inserts the media type (mtype) parameter in the Route header when routing to SIP entities.

 **Note:**

The Lync server does not connect with a Branch Session Manager in branch locations.

## Presence communication profile administration

You can configure attributes for the Presence communication profile when you create a user or edit the existing user. You can also configure the Presence-related attributes by using the user provisioning rule.

In System Manager, you must configure the Avaya Aura® users and assign typically some or all of the following attributes:

- Avaya E.164 communication address
- Avaya SIP communication address
- CM Endpoint profile
- Session Manager profile

You can configure the attributes from **User Management > Manage Users**.

You can create Presence profiles only for the default communication profile.

 **Note:**

To create the Presence communication profile, you must select **Avaya Presence/IM** and provide the communication address.

## CM Endpoint profile administration

### CM Endpoint profile of a user

With User Profile Management, you can create the CM Endpoint communication profile for a user to create an association between an endpoint and a user.

You can add, view, modify, and delete endpoint profile. You can go to Endpoint Management pages to modify any of the endpoint fields that are not available through User Profile Management.

### Login name of endpoint profile

The login name in the Identity section on the User Profile | Add and User Profile | Edit | <User Name> pages is the user name that is associated with the CM Endpoint communication profile. This user name appears in the **User** column in the Endpoint List.

For endpoints, the **Localized Display Name** and **Endpoint Display Name** fields in the Identity section of the User Profile Management user profile map to the **Name** and **Localized Display Name** fields of CM Endpoint. The **Localized Display Name** and **Endpoint Display Name** fields are optional. They default to the **Last Name** and **First Name** as given in the General section of the User Profile Management user profile. You can also fill in any other name of your choice.

 **Note:**

**Endpoint Display Name** and **Localized Display Name** are auto populated while user creation is based on **Last Name** and **First Name**. **Endpoint Display Name** and **Localized Display Name** values get automatically changed if any change is made to **Last Name** and **First Name** value from User Import, Web Console or Web Service operation for user update.

If the **Endpoint Display Name** and **Localized Display Name** are edited manually (not based on Last Name/First Name) during user creation or user edit operation, then these values will never get auto changed even if changes are made to user's **Last Name** and **First Name** from User Import, Web Console or Web Service operation for user update.

## Creating CM Endpoint profile

You can create one default or primary Communication Profile for a user. To this default profile, you can add one CM Endpoint profile. You can add a maximum of three CM Endpoint profile per user.

## Adding a CM Endpoint profile for a user

### Before you begin

Add Communication Manager by using Manage Elements or Discovery from **Inventory**.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, do one of the following:
  - To create a CM Endpoint profile for a new user profile, click **New**.
  - To create a CM Endpoint profile for an existing user, select the user and click **Edit**.
3. Click the **Communication Profile** tab.
4. In the PROFILES section, click the toggle button next to **CM Endpoint Profile**.

System Manager enables **CM Endpoint Profile** and displays the fields of the CM Endpoint profile.

5. Perform the following:
  - a. In the **System** field, select the Communication Manager system to add an endpoint.
  - b. In the **Profile Type** field, select **Endpoint**.
  - c. In the **Extension** field, type the extension number, and then click the **Editor** button next to the given extension number.
  - d. In the **Template** field, select the required template for the endpoint.
  - e. In the **Set Type** field, select the required set type for the endpoint.
6. **(Optional)** To delete the endpoint from the communication management device after removing the association between the endpoint and the user, select the **Delete on Unassign from User or on Delete User** check box.
7. Perform one of the following:
  - To save the changes, click **Commit**.

- To save the changes and stay on the same page, click **Commit & Continue**.

### Using the automatically generated call routes for SIP routing

#### About this task

Based on the primary or secondary Session Manager that you specified in **Session Manager Communication Profile**, the system automatically determines a route pattern.

#### Before you begin

In the Communication Manager instance that you associated with System Manager, do the following:

1. On the Route Pattern page, specify the primary Session Manager.
2. Select a SIP endpoint.

#### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. Click **Communication Profile**.
3. In **Session Manager Profile > SIP Registration > Primary Session Manager**, click a primary Session Manager.

Ensure that you have added a primary Session Manager. To add a primary Session Manager, see *Administering Avaya Aura® Communication Manager*.

4. In **CM Endpoint Profile**, do the following:
  - a. In the **Set Type** field, enter the details of a SIP set type.
  - b. Select the **Calculate Route Pattern** check box.

### Result

The system automatically generates route patterns for the user that you specified and for the Session Manager that you set as the primary Session Manager.

## Removing association between an CM Endpoint and a user

### Before you begin

Ensure that you have not selected the **Delete Endpoint on Unassign of Endpoint from User or Delete User** check box while associating a station with a user.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user and perform one of the following steps:
  - Click **Edit**.
  - Click **View > Edit**.
3. On the User Profile | Edit | <User Name> page, click the **Communication Profile** tab.
4. In the **CM Endpoint Profile** section, clear the check box next to the **CM Endpoint Profile** label.
5. Click **Commit**.

### Result

The system removes the association between the endpoint and the user. The endpoint is still provisioned on the communication management device.

## Deleting a CM Endpoint profile of a user

### Before you begin

Select the **Delete Endpoint on Unassign of Endpoint from User or Delete User** check box while associating a endpoint to a user.

### About this task

The delete functionality removes the association between the endpoint and the user, and deletes the endpoint from the communication management device.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user, and click **Edit**.

3. On the User Profile | Edit | <User Name> page, click the **Communication Profile** tab.
4. In the **CM Endpoint Profile** section, clear the check box next to the **CM Endpoint Profile** label.
5. Click **Commit**.

 **Note:**

You can delete only those endpoints that are associated with a user through User Management. You can delete nonuser associated endpoints through Endpoint management.

## Messaging profile administration

### Messaging profile of a user

With User Profile Management, you can create the Messaging communication profile for a user to create an association between a subscriber mailbox and a user.

You can add, view, modify, and delete messaging profile. You can go to Subscriber Management pages to modify any of the subscriber fields that are not available through User Profile Management.

### Login name of messaging profile

The login name in the Identity section on the User Profile | Add and User Profile | Edit | <User Name> pages is the user name that is associated with the Messaging communication profile. This user name appears in the **User** column in the Subscriber List.

For Subscribers, the **Last Name** and **First Name** fields in the General section of User Profile Management user profile directly map to the **Last Name** and **First Name** fields in Subscriber. The **Localized Display Name** and **Endpoint Display Name** fields are not applicable for Subscribers.

### Creating Messaging profile

You can create one default or primary Communication Profile for a user. To this default profile, you can add one Messaging profile per user.

### Adding a messaging profile for a user

#### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, perform one of the following steps:
  - If you are creating a messaging profile for a new user profile, click **New**.
  - If you are creating a messaging profile for an existing user, select the user and click **Edit**.
3. Click the **Communication Profile** tab.
4. In the Messaging Profile section, select the check box next to the **Messaging Profile** label.

5. In the Messaging Profile section, complete the relevant fields.

 **Note:**

To delete the subscriber mailbox from the communication management device after removing the association between the subscriber and the user, select the **Delete Messaging on Unassign of Subscriber from User or Delete User** check box.

6. Click **Commit** or **Commit & Continue** to add the messaging profile, or click **Cancel** to return to the previous page.

The field names that are marked with an asterisk (\*) are mandatory fields. You must enter valid information in these fields to create the CM Endpoint profile.

 **Note:**

You must add the messaging devices through Runtime Topology System (RTS) before you add a messaging profile for a user. After you create the user-subscriber association, the user name appears in the **User** column in the subscriber list.

## Modifying a messaging profile of a user

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user and click **Edit**.
3. On the User Profile | Edit | <User Name> page, click the **Communication Profile** tab.
4. In the PROFILES section, click Messaging Profile, and modify the relevant information in the fields.
5. Perform one of the following:
  - To save the changes to the database, click **Commit**.
  - To save the changes to the database and remain on the same page, click **Commit & Continue**.
  - To cancel the action and return to the previous page, click **Cancel**.

## Removing association between a subscriber mailbox and a user

### Before you begin

The **Delete Subscriber on Unassign of Subscriber from User or Delete User** check box is clear while associating a mailbox with a user.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user and click **Edit**.
3. On the User Profile | Edit | <User Name> page, click the **Communication Profile** tab.
4. In the Messaging Profile tab, clear the check box next to the **Messaging Profile** label.
5. Click **Commit**.

## Result

The system removes the association between the subscriber mailbox and the user. The subscriber mailbox is still provisioned on the communication management device.

## Deleting a subscriber mailbox

### Before you begin

You have selected the **Delete Subscriber on Unassign of Subscriber from User or on Delete User** check box while associating a subscriber mailbox to a user.

### About this task

This functionality deletes the subscriber mailbox from the messaging device after removing the association between the subscriber mailbox and the user.

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user and click **Edit**.
3. On the User Profile | Edit | <User Name> page, click the **Communication Profile** tab.
4. In the Messaging Profile section, clear the check box next to the **Messaging Profile** label.
5. Click **Commit**.

### **Note:**

You can delete only those subscribers that are associated with a user through User Management. You can delete non-user associated subscriber mailboxes only through Subscriber Management.

## CS 1000 profile administration

### CS 1000 profile administration

With User Management, you can create CS 1000 Endpoint Profile to create an association between an endpoint and a user.

To modify an endpoint or subscriber field that is not available through User Management, navigate to the Endpoint or Subscriber Management pages and modify the information. For information, see [Redirecting the CS 1000 user to Element Manager](#).

### Related links

[Redirecting the CS 1000 user to Element Manager](#) on page 269

### Redirecting the CS 1000 user to Element Manager

#### Before you begin

A user must exist with at least one communication profile.

To create a new user, navigate to **Users > User Management > Manage Users > New**.

#### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user and click **Edit**.
3. On the User Profile | Edit | <User Name> page, click the **Communication Profile** tab.
4. In the PROFILES section, click **CS 1000 Endpoint Profile** that you must update and click **Update**.

The system displays the user profile in the element manager that you select.

#### **Note:**

The system discards all unsaved changes that you make to the current user including the changes to communication profiles.

5. Enter the relevant information and click **Save**.

The system displays the Manage Users page.

### Adding a CS 1000 profile for a user

#### Before you begin

A user must exist.

To create a new user, navigate to **Users > User Management > Manage Users > New**.

#### About this task

For a communication profile, you can provide a maximum of one CS 1000 phone. To add additional phones for a user, you must add another communication profile.

#### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.

2. On the Manage User page, perform one of the following steps:
    - To create a profile for a new user profile, click **New**.
    - To create a profile for an existing user, select the user and click **Edit**.
  3. On the User Profile | Edit | <User Name> page, click the **Communication Profile** tab.
  4. In the **CS1000 Endpoint Profile** section, select the check box and complete the following fields:
    - a. In the **System** field, select a CS 1000 system.

The system displays a list of systems that are registered with the element registry.
    - b. Perform one of the following:
      - Click **Add new** and complete the following fields:
        - a. In the **Target** field, select a CS 1000 customer number.
        - b. In the **Template** field, select a template that CS 1000 Element Manager provides.
        - c. In the **Primary DN** field, enter a preferred primary DN.
    -  **Note:**

If you do not provide a primary DN, CS 1000 Element Manager automatically assigns a primary DN.
    - d. In the **Terminal Number** field, enter a preferred TN.
  - Click **Link existing**, and in the **Existing TN** field, enter the terminal number from the list of existing numbers.
  - c. Clear the **Include in Corporate Directory** check box to exclude the profile in the CS 1000 corporate directory.
  - d. **(Optional)** Select **Delete Endpoint on Unassign of Endpoint from User** if you must delete the endpoint from CS 1000 when you remove the association between the endpoint and the user.
5. Perform one of the following:
  - To save the changes to the database, click **Commit**.
  - To save the changes to the database and remain on the same page, click **Commit & Continue**.
  - To cancel the action and return to the previous page, click **Cancel**.

## Modifying a CS 1000 user profile

### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, select a user and click **Edit**.
3. On the User Profile | Edit | <User Name> page, click the **Communication Profile** tab.

4. Click **Update**.
5. In the CS 1000 Element Manager window, enter the relevant information in the fields.

 **Note:**

In CS 1000 Element Manager, do not update the CPND name. The system maps the CPND name to the System Manager UPM user **Localized Display Name**. Use System Manager UPM to update the CPND name. For more details, see the “Communication profiles synchronization” section.

6. Perform one of the following:
  - To save the changes to the database, click **Commit**.
  - To save the changes to the database and remain on the same page, click **Commit & Continue**.
  - To cancel the action and return to the previous page, click **Cancel**.

## Changing passwords of CS 1000 Presence users

### Procedure

1. To log on to the System Manager personal agent console, enter `http://<SMGR server-name>/pa`.
2. Click **Change Password**.
3. Enter the old and new passwords, and then click **Save**.

Presence Services recognizes the password change.

 **Note:**

The system needs a synchronized password that is the same password as the password that Presence Services uses to update CS 1000.

## IP Office profile administration

### Adding an IP Office endpoint profile on a user

#### Procedure

1. On the System Manager web console, click **Users > User Management**.
2. In the navigation pane, click **Manage Users**.
3. On the User Management page, perform one of the following steps:
  - To create a profile for a new user, click **New**.
  - To create a profile for an existing user, select the user and click **Edit**.
4. On the User Profile page, click the **Communication Profile** tab.
5. Select the **IP Office Endpoint Profile** check box.
6. Complete the **IP Office Endpoint Profile** section.

7. Perform one of the following:

- To save the changes to the database, click **Commit**.
- To save the changes to the database and remain on the same page, click **Commit & Continue**.
- To cancel the action and return to the previous page, click **Cancel**.

 **Note:**

To assign an extension to the user, perform one of the following actions:

- Assign an available extension to the user, select the **Use Existing Extension** check box, and select an unassigned extension from the drop-down box.
- Or assign an available module-port to the user from the **Module-Port** drop-down box, and type the new extension. The module-port combination is valid only when you associate a digital or an analog extension type to the user.

To assign an extension to a user with other set types, perform one of the following actions:

- Type an appropriate extension.
- Select the **Use Existing Extension** check box to choose an existing extension.
- Select an unassigned extension from the drop-down field.

## Removing the association between an IP Office endpoint profile and a user

### About this task

You must add, edit, or delete the end point profile for a user with an IP Office Endpoint profile only when IP Office is active and connected to System Manager.

 **Note:**

Do not perform the add, edit, or delete operations when IP Office is temporarily unreachable. However, in situations when IP Office is unused or corrupted, you must set the `force_delete_user` property to true in the `IPOffice.properties` file by using putty to delete IP Office Endpoint Profile from System Manager users.

### Procedure

1. On the System Manager web console, click **Users > User Management**.
2. In the navigation pane, click **Manage Users**.

3. On the User Management page, select a user, and perform one of the following:
  - Click **Edit**.
  - Click **View > Edit**.
4. On the User Profile Edit page, click the **Communication Profile** tab.
5. Clear the **IP Office Endpoint Profile** check box.
6. Click **Commit**.

#### *Removing the association between an IP Office endpoint profile and a user from the properties file*

##### About this task

Use the procedure to remove association between an IP Office endpoint profile and a user only when IP Office is unused or corrupted.

##### Procedure

1. Using putty, navigate to the `$ABG_Home/tools` folder.
2. Open the `IPOffice.properties` file, and set the `force_delete_user` property to true.  
By default, the `force_delete_user` property is set to false to ensure that the user data on IP Office and System Manager is synchronized.
3. Save the properties file.
4. To restart the JBoss service, at the prompt, type `service jboss restart`.  
Wait until the JBoss service starts.
5. On System Manager web console, click **Users > User Management** and delete the IP Office Endpoint Profile of the user that exist on the abandoned or corrupted IP Office.
6. Set the `force_delete_user` property to false and restart the JBoss service.

## Managing default contact list of the user

### Adding a contact in the Default Contact list

#### Procedure

1. On the System Manager web console, click **Users > User Management**.
2. In the navigation pane, click **Manage Users**.

3. On the User Management page, perform one of the following:
  - To add a contact for a new user, click **New**.
  - To add a contact for an existing user, select a user and click **Edit**.
4. Click the **Contacts** tab.
5. In the **Default Contact List** section, enter a brief description of the contact list in the **Description** field.
6. In the **Associated Contacts** section, click **Add**.
7. On the Attach Contacts page, select one or more contacts and click **Select**.

 **Note:**

In the Multi Tenancy environment, when the tenant administrator of a tenant creates or updates the user, the administrator can attach only the following contacts:

- Private contacts of the user
- Public contacts
- Users who belong to that tenant

The system displays the new contacts in the table in the **Associated Contacts** section.

## Modifying membership details of a contact in a contact list

### About this task

Use this feature to set the speed dial and presence buddy information for the contacts in the Default Contact list.

### Procedure

1. On the System Manager web console, click **Users > User Management**.
2. In the navigation pane, click **Manage Users**.
3. On the User Management page, select a user and click **Edit**.
4. On the User Profile Edit page, click the **Contacts** tab.
5. In the **Associated Contacts** section, select a contact and click **Edit**.
6. On the Edit Contact List Member page, in the **Contact Membership Details** section, change the required information in the fields.

You can only change the information in the fields displayed in the **Contact Membership Details** section.

7. Click **Add**.
8. Click **Commit** to save the changes.

4. On the User Profile Edit page, click the **Contacts** tab.
5. Select one or more contacts from the Associated Contacts section and click **Remove**.

## Attach Contacts field descriptions

In the Multi Tenancy environment, when the tenant administrator of a tenant creates or updates the user, the administrator can attach only the following contacts:

- Private contacts of the user
- Public contacts
- Users who belong to that tenant

| Name               | Description                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------|
| Last Name          | The last name of the contact.                                                                         |
| First Name         | The first name of the contact.                                                                        |
| Scope              | The categorization of the contact based on whether the contact is a user, public, or private contact. |
| Display/Login Name | The unique login name or display name of the contact.                                                 |

*Table continues...*

| Name                   | Description                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Contact Address</b> | The address of a private or public contact. No contact address is associated with a contact type user.                |
| <b>User Handles</b>    | The communication handles associated with the user. These handles are defined in the communication profile of a user. |
| <b>Filter: Disable</b> | Hides the column filter fields without resetting the filter criteria. This is a toggle button.                        |

### Contact Membership Details

| Field                    | Description                                                                                                                                    |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Label</b>             | The text description for classifying this contact.                                                                                             |
| <b>Alternative Label</b> | The text description for classifying this contact. The field is similar to <b>Label</b> , and is used to store label in an alternate language. |
| <b>Description</b>       | The brief description about the contact.                                                                                                       |
| <b>Presence Buddy</b>    | An option to indicate whether to allow monitoring of the presence information of the contact.                                                  |
| <b>Speed Dial</b>        | An option to indicate whether to allow speed dial for the contact.                                                                             |
| <b>Address/Handle</b>    | The fully qualified URI for interacting with the contact. This field is available only if you select the <b>Speed Dial</b> check box.          |
| <b>Speed Dial Entry</b>  | The reduced number that represents the speed dial number. This field is available only if you select the <b>Speed Dial</b> check box.          |

### Contact Details

| Field                         | Description                                                                                    |
|-------------------------------|------------------------------------------------------------------------------------------------|
| <b>Last Name</b>              | The last name of the contact.                                                                  |
| <b>First Name</b>             | The first name of the contact.                                                                 |
| <b>Middle Name</b>            | The middle name of the contact.                                                                |
| <b>Description</b>            | The brief description about the contact.                                                       |
| <b>Company</b>                | The name of the company to which the contact belongs.                                          |
| <b>Localized Display Name</b> | The localized display name of a user. The name is usually the localized full name.             |
| <b>Endpoint Display Name</b>  | The endpoint display name of the contact.                                                      |
| <b>Language Preference</b>    | The list of languages from which you set a language as the preferred language for the contact. |
| <b>Update Time</b>            | The time when the contact information was last updated.                                        |
| <b>Source</b>                 | The source of provisioning the contact.                                                        |

### Postal Address

| Field                | Description                                                  |
|----------------------|--------------------------------------------------------------|
| <b>Name</b>          | The name of the contact.                                     |
| <b>Address Type</b>  | The type of mailing address such as, home or office address. |
| <b>Street</b>        | The name of the street.                                      |
| <b>Locality Name</b> | The name of the city or town.                                |
| <b>Postal Code</b>   | The postal code of the locality of the city or town.         |

*Table continues...*

| Field           | Description                                   |
|-----------------|-----------------------------------------------|
| <b>Province</b> | The full name of the province of the contact. |
| <b>Country</b>  | The name of the country of the contact.       |

### Contact Address

| Field                    | Description                                                                                                                               |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Address</b>           | The address that you can use to communicate with the contact. The address can be a phone number, email address, or IM of the contact.     |
| <b>Type</b>              | The type of communication medium for interacting with the user.                                                                           |
| <b>Category</b>          | The categorization of the address based on the location.                                                                                  |
| <b>Label</b>             | The description for classifying this contact.                                                                                             |
| <b>Alternative Label</b> | The description for classifying this contact. The field is similar to <b>Label</b> , and is used to store label in an alternate language. |

| Button     | Description                                     |
|------------|-------------------------------------------------|
| <b>Add</b> | Saves the modified information in the database. |

|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>More Actions &gt; Export Selected Users</b>                                      | Displays the Export users page where you can export the user-related data in bulk of selected users.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>More Actions &gt; Export Delta Users</b>                                         | <p>Displays the Export users page where you can export the added, updated, or deleted user-related data for the specific delta period.</p> <p> <b>Note:</b></p> <p>The permanently deleted users login-names in the delta period are identified on the basis of audit logs of permanently deleted users in the system. Therefore, if you change the Data Retention settings for <b>LogPurgeRule</b>, the system might affect the permanently deleted users list in the exported zip file.</p> |
| <b>More Actions &gt; Import Global Settings</b>                                     | Displays the Import global settings page where you can import shared addresses, public contacts, and presence access control list (ACLs) in bulk.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>More Actions &gt; Download Excel Template</b>                                    | Navigates to the location from where you can download the Excel template that System Manager supports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options &gt; Advanced Search</b>                                                 | Displays fields where you can specify the search criteria for searching a user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options &gt; Clear Filters</b>                                                   | Clears the filter criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Filter menu</b>                                                                  | You can find the <b>Filter menu</b> icon next to the name of each column. Filters the data based on the search criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Select: All</b>                                                                  | Selects all users in the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Select: None</b>                                                                 | Clears the check box selections.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|  | Refreshes the user information in the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Criteria

Click **Advanced Search** to view this section. You can find the **Advanced Search** link in the **Options** drop-down list in the upper-right corner of the page.

| Name            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Criteria</b> | <p>The criteria to search. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Field 1:</b> Lists the criteria that you can use to search users.</li> <li>• <b>Field 2:</b> Lists the operators for evaluating the expression. The operators displayed depends on the criterion that you selected in <b>Field 1</b>.</li> <li>• <b>Field 3:</b> Lists the value for the search criterion. The User Management service retrieves and displays users that match this value.</li> </ul> |

## User Profile | Add field descriptions

Use the User Profile | Add page to create or add a new user. This page has four tabs:

- Identity
- Communication Profile
- Membership
- Contacts

 **Note:**

Fields marked with an asterisk are mandatory, and you must enter appropriate information in these fields.

### Organization

| Name           | Description                                                                                                                                                        |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tenant</b>  | The name of the tenant that you select.                                                                                                                            |
| <b>Level 1</b> | The name of the level 1 hierarchy of the tenant organization. For example, Site.<br>The tenant administrator provides the hierarchy on the Tenant Management page. |
| <b>Level 2</b> | The name of the level 2 hierarchy of the tenant organization. For example, Department.                                                                             |
| <b>Level 3</b> | The name of the level 3 hierarchy of the tenant organization. For example, Team.                                                                                   |

### User Provisioning Rule

| Name                          | Description                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------|
| <b>User Provisioning Rule</b> | The name of the user provisioning rule.<br>You can provide only one user provisioning rule. |

 **Note:**

When you use the user provisioning rule to create a user, the system populates the values of user attributes from the user provisioning rule.

### Identity tab: Identity

| Name             | Description                                     |
|------------------|-------------------------------------------------|
| <b>Last Name</b> | The last name of the user. For example, Miller. |

| Name                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last Name (Latin Translation)</b>  | <p>The user-preferred last name that the system must display on the endpoints. For example, Miller.</p> <p>Typically, the name is in the written or spoken language of the user.</p> <p> <b>Note:</b></p> <p>When you create a user, if the <b>Last Name (Latin Translation)</b> and <b>First Name (Latin Translation)</b> fields are:</p> <ul style="list-style-type: none"> <li>• Blank, the system displays the last name and first name in the fields. The values change when the last and first names change.</li> <li>• Filled, the values remain the same even after you change the values in the <b>Last Name</b> and <b>First Name</b> fields.</li> </ul> |
| <b>First Name</b>                     | The first name of the user. For example, John.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>First Name (Latin Translation)</b> | <p>The user-preferred first name that the system must display on the endpoints. For example, John.</p> <p>Typically, the name is in the written or spoken language of the user.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Middle Name</b>                    | The middle name of the user, if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>                    | A brief description of the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

*Table continues...*

| Name                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Login Name</b>    | <p>The login name of the user.</p> <p>With Release 8.1.3, the <b>Login Name</b> field supports the login name with apostrophe ('). For example, aine'mars@xyz.com.</p> <p>The following characters are supported:</p> <ul style="list-style-type: none"> <li>• ,</li> <li>• -</li> <li>• _</li> <li>• ?</li> <li>• %</li> <li>• !</li> <li>• ~</li> <li>• *</li> <li>• (</li> <li>• )</li> <li>• =</li> <li>• +</li> <li>• \$</li> <li>• ,,</li> <li>• ;</li> <li>• .</li> <li>• '.</li> </ul> <p>The login name is not case-sensitive. For example, if you enter JMILLER@AVAYA.COM, the system converts the login name to lowercase, that is, jmiller@avaya.com. However, on the login page, you can enter the login name in uppercase or lowercase.</p> <p>If you log in to the system as admin, you cannot edit the login name.</p> <p> <b>Note:</b></p> <p>To create the user data by using a blank excel template, append the login name with #ProfileSetName in all worksheets, except Basic and Profile Set. The system associates the user records with the communication profile that you have provided. For example, jmiller@avaya.com#ProfileSetName.</p> |
| <b>Email Address</b> | The email address of the user for receiving email notifications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Name                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Type</b>              | <p>The authentication type that defines how the system authenticates the user. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Enterprise</b>: Directory servers that are external to System Manager authenticate the user login.</li> <li>• <b>Basic</b>: Avaya authentication service authenticates the user login.</li> </ul> <p>For bulk import of users by using Excel, <b>User Type</b> is always Basic. Therefore, the <b>User Type</b> field remains invisible in the Excel file.</p> |
| <b>Password</b>               | The password to log in to the System Manager web console.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Confirm Password</b>       | The password that you reenter for confirmation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Localized Display Name</b> | The localized display name of a user. The name is typically the localized full name.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Endpoint Display Name</b>  | The full text name of the user represented in ASCII. The display name supports displays that cannot handle localized text, for example, some endpoints.                                                                                                                                                                                                                                                                                                                                                        |
| <b>Title</b>                  | The personal title that is set to address a user. The title is typically a social title and not the work title. For example, Mr.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Language Preference</b>    | The preferred written or spoken language of the user. For example, English.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Time Zone</b>              | The preferred time zone of the user. For example, (+05:30) Chennai, Kolkata, Mumbai, New Delhi.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Employee ID</b>            | The employee number of the user. For example, 20081234.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Department</b>             | The department to which the user belongs. For example, Human Resources.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Company</b>                | The organization where the user works. For example, Avaya Inc.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Identity tab: Address

| Name                    | Description                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select check box</b> | The option to select an address in the table.                                                                                                    |
| <b>Name</b>             | The name of the addressee. For example, Avaya.                                                                                                   |
| <b>Address Type</b>     | <p>The type of address. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Office</b></li> <li>• <b>Home</b></li> </ul>            |
| <b>Street</b>           | The name of the street. For example, Magarpatta.                                                                                                 |
| <b>City</b>             | The name of the city or town. For example, Pune.                                                                                                 |
| <b>Postal Code</b>      | The postal code used by postal services to route mail to a destination. For example, 411028. For United States, the postal code is the Zip code. |
| <b>Province</b>         | The full name of the province. For example, Maharashtra.                                                                                         |
| <b>Country</b>          | The name of the country. For example, India.                                                                                                     |

| Button                       | Description                                                              |
|------------------------------|--------------------------------------------------------------------------|
| <b>New</b>                   | Displays the Add Address page to add the address details.                |
| <b>Edit</b>                  | Displays the Edit Address page to modify the address.                    |
| <b>Delete</b>                | Deletes the selected address.                                            |
| <b>Choose Shared Address</b> | Displays the Choose Address where you choose a shared or common address. |

## Identity tab: Localized Names

### \* Note:

Use the **Localized Names** section only for the CS 1000 system, not for Session Manager and Communication Manager.

| Name                | Description                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------|
| <b>Language</b>     | The localized language for displaying the user name. For example, English. You must select the language. |
| <b>Display Name</b> | The user name in the localized language you choose. For example, John Miller.                            |

| Button        | Description                                                                   |
|---------------|-------------------------------------------------------------------------------|
| <b>New</b>    | Displays fields that you can use to create a new localized name for the user. |
| <b>Edit</b>   | Displays fields that you can use to modify the localized name of the user.    |
| <b>Delete</b> | Deletes the localized names that you select for the user.                     |
| <b>Add</b>    | Adds or edits the localized name of the user.                                 |
| <b>Cancel</b> | Cancels the addition or edits of the localized name.                          |

## Communication Profile tab: Communication Profile

Use this section to create, modify, and delete a communication profile of the user. Each communication profile can contain one or more communication addresses for a user.

| Name                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Communication Profile Password</b> | <p>The communication profile password.</p> <p>The field is available only if you enable the communication profile. The password policy is configured on the <b>Users &gt; User Management &gt; Communication Profile Password Policy</b> page.</p> <p>When you provide the communication password value during bulk edit of users, the system overwrites any existing communication profile passwords of the user.</p> <p>For information about password policy, see “Communication profile password policy”.</p> |
| <b>Confirm Password</b>               | The communication profile password that you reenter for confirmation.                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Button        | Description                                                                          |
|---------------|--------------------------------------------------------------------------------------|
| <b>New</b>    | Creates a new communication profile for the user.                                    |
| <b>Delete</b> | Deletes the selected communication profile.                                          |
| <b>Done</b>   | Saves the communication profile information that you updated or added for a profile. |
| <b>Cancel</b> | Cancels the operation of adding a communication profile.                             |

The system enables the following fields when you click **New** in the **Communication Profile** section.

| Name           | Description                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>    | The name of the communication profile for the user.                                                                          |
| <b>Default</b> | <p>The option to select a profile as default or the active profile.</p> <p>At a time, only one active profile can exist.</p> |

### Communication Profile tab: Communication Address

Use this section to create, modify, and delete the communication address of a user. Each communication profile can contain one or more communication addresses for a user.

| Name          | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>   | The type of handle.                                                                                                          |
| <b>Handle</b> | A unique communication address of the user. Communication Manager Release 7.1.2 and later also support alphanumeric handles. |
| <b>Domain</b> | The name of the domain with which the handle is registered.                                                                  |

| Button     | Description                         |
|------------|-------------------------------------|
| <b>New</b> | To add a new communication address. |

*Table continues...*

| Button        | Description                                                  |
|---------------|--------------------------------------------------------------|
| <b>Edit</b>   | To edit the information of a selected communication address. |
| <b>Delete</b> | To delete the selected communication address.                |

When you click **New** and **Edit** in the Communication Address section, the page displays the following fields that define the communication address of the user:

| Name        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b> | <p>The type of handle. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Avaya SIP</b>: Indicates that the handle supports Avaya SIP-based communication.</li> <li>• <b>Avaya E.164</b>: Indicates that the handle refers to an E.164 formatted address. E.164 numbers can have maximum 13 digits and are usually written with a + prefix.</li> <li>• <b>Microsoft SIP</b>: Indicates that the handle supports SIP-based communication.</li> <li>• <b>Microsoft Exchange</b>: Indicates that the handle is an email address and supports communication with Microsoft SMTP server.</li> <li>• <b>Lotus Notes</b>: Indicates that the handle is for Lotus Notes and domino calendar.</li> <li>• <b>IBM Sametime</b>: Indicates that the handle is for IBM Sametime. The address must be in the DN=IBMHandle format.</li> <li>• <b>Avaya Presence/IM</b>: Indicates that the handle is an address that is used for Extensible Messaging and Presence Protocol (XMPP)-based Internet Messaging (IM) services and XMPP or Session Initiation Protocol-based (SIP) Presence services.</li> </ul> <p> <b>Note:</b></p> <p>To create the Presence communication profile, you must select <b>Avaya Presence/IM</b> and provide the communication address.</p> <ul style="list-style-type: none"> <li>• <b>GoogleTalk</b>: Indicates that the handle supports XMPP-based communication with the Google Talk service.</li> <li>• <b>Other Email</b>: Indicates that the handle is an email address other than MS Exchange email addresses.</li> <li>• <b>Other SIP</b>: Indicates that the handle supports SIP-based communication other than the listed ones.</li> <li>• <b>Other XMPP</b>: Indicates that the handle supports XMPP-based communication other than the listed ones.</li> <li>• <b>Work Assignment</b>: Indicates that the handle supports accounts that can be assigned to an agent for Work Assignment.</li> </ul> |

| Name                           | Description                                                                                                                                                                                                                                               |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fully Qualified Address</b> | The fully qualified domain name or uniform resource identifier. The address can be an email address, IM user, or an address of a communication device by using which the user can send or receive messages. You must provide the fully qualified address. |

| Button        | Description                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------|
| <b>Add</b>    | Saves the new communication address or modified communication address information in the database. |
| <b>Cancel</b> | Cancels the addition of communication address.                                                     |

### Communication Profile tab: Session Manager

 **Note:**

The system displays the following fields only if a communication profile of the user exists for the product:

| Name                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Primary Session Manager</b>   | The instance that you want to use as the home server for the currently displayed communication profile. As a home server, the selected primary Session Manager instance is used as the default access point for connecting devices associated with the communication profile to the Avaya Aura <sup>®</sup> network. You must select the primary Session Manager server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Secondary Session Manager</b> | The Session Manager instance that you select as the secondary Session Manager. It provides continued service to SIP devices associated with this communication profile when the primary Session Manager server becomes unavailable. A selection is optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Survivability Server</b>      | <p>For local survivability, you can specify a survivability server to provide survivability communication services for devices associated with a communication profile when the local connectivity to Session Manager instances in Avaya is lost. If you select Branch Session Manager, and the termination and origination application sequences contain a Communication Manager application, sequencing to this application continues, locally, to Communication Manager survivable remote server resident with Branch Session Manager. A selection is optional.</p> <p> <b>Note:</b></p> <p>If a termination or origination application sequence contains a Communication Manager application, the Communication Manager instance associated with the application must be the main server for the Communication Manager survivable remote server that resides with Branch Session Manager.</p> <p>After typing minimum of 3 characters, wait for three seconds to capture the final keyword, and fetch the required results.</p> |

*Table continues...*

| Name                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Max. Simultaneous Devices</b>                                | The maximum number of endpoints that you can register at a time by using this communication profile. If you register more than one endpoint, all the endpoints receive calls simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Block New Registration When Maximum Registrations Active</b> | <p>If you select the check box and an endpoint attempts to register using this communication profile after the registration requests exceed the administered limit, the system denies any new registrations with Session Manager. The system sends a warning message and stops the SIP service to the endpoint.</p> <p>If you clear the check box, the system accepts the new registration and unregisters the endpoint with the oldest registration. However, if the endpoint with the oldest registration is active on a call, then the system does not unregister the endpoint until the call is completed.</p> |
| <b>Origination Application Sequence</b>                         | <p>The application sequence that the system invokes when routing calls from this user. A selection is optional.</p> <p> <b>Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p>                                                                                                                                                                                |
| <b>Termination Application Sequence</b>                         | <p>The application sequence that is invoked when the system routes calls to this user. A selection is optional.</p> <p> <b>Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p>                                                                                                                                                                               |
| <b>Emergency Calling Origination Sequence</b>                   | The list of application sequences invoked when the system routes emergency calls from this user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Emergency Calling Termination Sequence</b>                   | The list of application sequences invoked when the system routes emergency calls to this user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Home Location</b>                                            | The home location to support mobility for the currently displayed user. Session Manager uses the home location specifically when the IP address of the calling phone does not match the IP Address Pattern of any location. You must specify a value.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Conference Factory Set</b>                                   | <p>The conference factory set to enable media capability-based call routing to the Conferencing SIP entities.</p> <p>Use the <b>Session Manager &gt; Application Configuration &gt; Conference Factories</b> webpage to administer the Conference Factory Sets.</p>                                                                                                                                                                                                                                                                                                                                                |
| <b>Enable Centralized Call History</b>                          | <p>The option to enable the call history feature for SIP users.</p> <p>By default, the system disables the call history feature. The maximum number of call logs per communication profile is 100.</p>                                                                                                                                                                                                                                                                                                                                                                                                             |

**Communication Profile tab: Avaya Breeze® platform Profile**

| Name                   | Description                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Service Profile</b> | The profile that you assign to the user. The user can gain access to the service contained in the profile. |

**Communication Profile tab: CM Endpoint Profile****\* Note:**

The system displays these fields only if a Communication Manager Endpoint profile exists for the user.

| Name                          | Description                                                                                                                                                                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                 | The Communication Manager system on which you add the endpoint. You must select the system.                                                                                                                                                                                                                    |
| <b>Profile Type</b>           | The type of Communication Manager Endpoint profile that you create. You must select the profile type.                                                                                                                                                                                                          |
| <b>Use Existing Endpoints</b> | The existing endpoint extension to associate with this profile. If you do not select this check box, the system uses the available extensions.                                                                                                                                                                 |
| <b>Extension</b>              | The extension of the endpoint that you associate this profile with. You must select the extension.<br><br>The field lists the endpoints, existing or available, based on the option you selected in the <b>Use Existing Endpoints</b> check box.                                                               |
| <b>Endpoint Editor</b> button | To start the Communication Manager application where you can edit or view details of the endpoint.<br><br>After you save the changes in Communication Manager, the system updates the modified data on the device or database only after you commit the changes on the User Profile   Edit   <User Name> page. |
| <b>Template</b>               | The template, system defined or user defined, that you associate with the endpoint. Select the template based on the set type you add.                                                                                                                                                                         |
| <b>Set Type</b>               | The set type of the endpoint you associate with. When you select a template, the system populates the corresponding set types.                                                                                                                                                                                 |
| <b>Sub Type</b>               | This field is configured for CS 1000 station types only. You can select the specific set for <b>Set Type</b> . On the Manage Endpoint page, <b>Sub Type</b> is labeled as <b>Set</b> .                                                                                                                         |
| <b>Terminal Number</b>        | This field is configured for CS 1000 station types only. You can enter numbers in the following range: 0.0.0.0 to 252.1.15.31.<br><br>The first digit must be divisible by 4. For example: 0, 4, 8, ..., 252.                                                                                                  |

| <b>System ID</b>               | <p>This field is configured for CS 1000 station types only. This field allows you to leave the field blank or enter a string of up to 9 characters. With Release 8.0 more than one station can use the combination of <b>System ID</b> and <b>Terminal Number</b>.</p> <p>With Release 8.0.1, each station must have a unique combination of <b>System ID</b> and <b>Terminal Number</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Security Code</b>           | The security code for authorized access to the endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Port</b>                    | <p>The relevant port for the set type you select. You must select the port.</p> <p>The field lists the possible ports based on the selected set type.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Voice Mail Number</b>       | <p>The voice mail number of the endpoint you associate with.</p> <p> <b>Note:</b></p> <p>You must clear Local Device Services Data on all Avaya Aura® Web Gateway nodes if you change the value of <b>Voice Mail Number</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Preferred Handle</b>        | <p>Numeric only handles, SIP handles, or nonSIP handles, that are administered for a user.</p> <p>The <b>Preferred Handle</b> field is optional. Select numeric handle for alphanumeric support. By default, the field is blank.</p> <p>If the type of SIP entity is Communication Manager, Session Manager uses the preferred handle in the CM Endpoint profile. By default, for a SIP station, Communication Manager uses the extension number as the phone number entry on an OPS station-mapping table. If your enterprise dial plan has SIP handles that are different from the Communication Manager extension, then use the <b>Preferred Handle</b> field to change the phone number entry on the OPS station-mapping table on the Communication Manager.</p> <p>To modify the phone number entry, the Communication Address in System Manager should have a SIP handle. In the CM Endpoint Communication Profile, set the <b>Preferred Handle</b> field to the SIP handle format. After you click <b>Commit</b>, System Manager sets the <b>Phone Number</b> field in the OPS station-mapping table on Communication Manager to the SIP handle format. If you do not need this feature, then set the <b>Preferred Handle</b> value to <b>None</b>.</p> |
| <b>Calculate Route Pattern</b> | The option to automatically select the route pattern based on the primary or secondary Session Manager configured in <b>Session Manager Communication Profile</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

If you clear the check box, the system does not override the localized display name in the <b>Localized Display Name</b> field.</li> </ul> |
| <b>Allow H.323 and SIP Endpoint Dual Registration</b> | <p>The option to register an H.323 endpoint and a SIP endpoint together at the same time to the same extension. For more information about the SIP and H.323 dual registration feature, see <i>Avaya Aura® Communication Manager Feature Description and Implementation</i> on the Avaya Support website at <a href="http://support.avaya.com">http://support.avaya.com</a>.</p>                                                                                                                                                                                                                                                                                                                                                     |

### Communication Profile tab: CS 1000 Endpoint Profile

| Name                   | Description                                                                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>          | The system that will be the element manager of the CS 1000 endpoint profile. You must select the system.                                                                                                                   |
| <b>Add new</b>         | The option to create a new phone.                                                                                                                                                                                          |
| <b>Target</b>          | <p>The system customer number of the CS 1000 system. You must select the target.</p> <p>The system displays the field only when you select <b>Add new</b>.</p>                                                             |
| <b>Template</b>        | <p>The phone or endpoint template that you can choose for the user. The element manager maintains all templates. You must select a template.</p> <p>The system displays the field only when you select <b>Add new</b>.</p> |
| <b>Update</b>          | The station profile information updated for the user. When you click <b>Update</b> , the system takes you to the element manager cut-through for the updates.                                                              |
| <b>Service Details</b> | The service details of endpoints, such as set type, after phone creation.                                                                                                                                                  |
| <b>Primary DN</b>      | <p>The primary directory number of the phone. You can enter only numeric values in this field.</p> <p>The system displays the field only when you select <b>Add new</b>.</p>                                               |
| <b>Terminal Number</b> | <p>The terminal number of the phone.</p> <p>The system displays the field only when you select <b>Add new</b>.</p>                                                                                                         |
| <b>Link existing</b>   | The option to associate with the existing phone.                                                                                                                                                                           |
| <b>Existing TN</b>     | <p>The terminal number from the list of existing numbers.</p> <p>The system displays the field only when you select <b>Link existing</b>.</p>                                                                              |

Table continues...

| Name                                  | Description                                                                |
|---------------------------------------|----------------------------------------------------------------------------|
| <b>Include in Corporate Directory</b> | The option to add this profile to the CS 1000 Corporate Directory feature. |

### Communication Profile tab: Messaging Profile

**\* Note:**

The system displays the following fields only if you can configure a messaging profile for the user

| Name                                                                           | Description                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                                                                  | The messaging system on which you add the subscriber. You must select the system.                                                                                                                                                                                                                                    |
| <b>Use Existing Subscriber on System</b>                                       | The option to specify whether to use an existing subscriber mailbox number to associate with this profile.                                                                                                                                                                                                           |
| <b>Mailbox Number</b>                                                          | The mailbox number of the subscriber. You must select the mailbox number.<br><br>The field takes the existing mailbox number that you associate with this profile. The value in the field is valid only if you select the <b>Use Existing Subscriber on System</b> check box.                                        |
| <b>Messaging Editor</b>                                                        | The Messaging application where you can edit or view details of the profile of the messaging endpoint.<br><br>After you save the changes in the Messaging system, the system does not update the modified data on the device or database until you commit the changes on the User Profile   Edit   <User Name> page. |
| <b>Template</b>                                                                | The system-defined or user-defined template that you associate with the subscriber.                                                                                                                                                                                                                                  |
| <b>Password</b>                                                                | The password for logging in to the mailbox. You must provide the password.                                                                                                                                                                                                                                           |
| <b>Delete Subscriber on Unassign of Subscriber from User or on Delete User</b> | The option to specify whether to delete the subscriber mailbox from the Messaging device or Communication System Management when you remove this Messaging profile or delete the user.                                                                                                                               |

### Communication Profile tab: Avaya Messaging Profile

| Name                     | Description                                                                                                                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Officelinx System</b> | The Avaya Messaging system to which you add a mailbox.                                                                                                                                                    |
| <b>Refresh</b>           | The option to get information about company, departments, and feature groups from Avaya Messaging and save locally on System Manager for future use.<br><br>You do not require to refresh for every user. |
| <b>Mailbox Number</b>    | The mailbox number of the subscriber.                                                                                                                                                                     |

*Table continues...*

| Name                                     | Description                                                                                                                                                                                                                                                           |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Numeric Password</b>                  | The numeric password that is used to log in to the Avaya Messaging system.                                                                                                                                                                                            |
| <b>Confirm Numeric Password</b>          | The numeric password that you retype to confirm.                                                                                                                                                                                                                      |
| <b>Application User Password</b>         | The password that is used to gain access to non-telephone applications, such as Web Client, iLink Pro, iLink Pro Mobile, and iLink Pro Desktop.                                                                                                                       |
| <b>Confirm Application User Password</b> | The password that you retype to confirm.                                                                                                                                                                                                                              |
| <b>Company</b>                           | The name of the company to which the user belongs.                                                                                                                                                                                                                    |
| <b>Department</b>                        | The department to which the user belongs.                                                                                                                                                                                                                             |
| <b>Feature Group</b>                     | The feature group name that determines the rules for the mailboxes associated with it.                                                                                                                                                                                |
| <b>Capability</b>                        | The type of functionality that the user contains. The values are: <ul style="list-style-type: none"> <li>• <b>Standard</b></li> <li>• <b>Fax</b></li> <li>• <b>Messaging</b></li> <li>• <b>Collaboration</b></li> <li>• <b>Messaging and Collaboration</b></li> </ul> |
| <b>Domain Account Name</b>               | The mailbox NT account name of the Avaya Messaging profile.                                                                                                                                                                                                           |
| <b>Synchronization User Name</b>         | The account name that is used to gain access to the email server, for example, Microsoft Exchange and Google Gmail.                                                                                                                                                   |

**\* Note:**

Only one-way update is supported for Officelinx elements. If you make any change directly on Officelinx, it does not reflect on System Manager. If you edit the user from System Manager, it overrides the changes you made directly on Officelinx.

### Communication Profile tab: IP Office Endpoint Profile

Use this profile to assign a new or an existing user to a System Manager device in User Management.

While adding a user, if you choose to assign a CM endpoint profile and an IP Office endpoint profile to the user, then the system uses the IP Office endpoint profile as the survivability option for the CM endpoint profile. That is, the endpoint extension used in the CM endpoint profile is also used for creating an IP Office endpoint profile so that when Communication Manager is unavailable, the IP Office device can serve the extension.

**\* Note:**

If a Communication Manager endpoint profile is present while adding or editing a user, the user administration functions in the centralized mode. If a Communication Manager endpoint profile is present, the user administration functions in the distributed mode.

Before you add an IP Office endpoint profile for a centralized user, commit the changes to the Communication Manager endpoint profile and the Session Manager endpoint profile.

| Name                                   | Description                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                          | The list of IP Office device names from which you can select the IP Office device that you associate with the user. You must select the template.                                                                                                                                                             |
| <b>Template</b>                        | The list of user templates from which you can select your preferred template to set the user configurations. You must select the template.                                                                                                                                                                    |
| <b>Use Existing Extension</b>          | Select the check box to use an existing endpoint extension to associate with this profile. If you do not select this check box, the system uses the available extensions.                                                                                                                                     |
| <b>Extension</b>                       | The extension of the endpoint you associate with. You must select the extension.<br><br>The field lists the endpoints, existing or available, based on the option you selected in the <b>Use Existing Endpoints</b> check box.                                                                                |
| <b>Endpoint Editor</b>                 | Starts the IP Office application where you can edit or view the details of the IP Office endpoint.<br><br>After you save the changes in the IP Office manager, the system updates the modified data on the device or database only when you commit the changes on the User Profile   Edit   <User Name> page. |
| <b>Module-Port</b>                     | The module port combination list for IP Office analog extensions. You must select <b>Module-Port</b> for centralized users with Set Type as <b>Analog</b> .                                                                                                                                                   |
| <b>Set Type</b>                        | The set type for the IP Office endpoint profile. By default, the <b>Set Type</b> field is disabled. If you select a template, the system populates the set type.                                                                                                                                              |
| <b>Delete Extension On User Delete</b> | The option to delete the extension associated with the user while deleting the user. By default, this check box is clear. This option is available for communication profiles associated with <b>Analog</b> and <b>Digital</b> set types.                                                                     |

### Communication Profile tab: Equinox Conferencing

| Name                         | Description                                  |
|------------------------------|----------------------------------------------|
| <b>Equinox User Password</b> | The Equinox user password.                   |
| <b>Virtual Room Number</b>   | The virtual room number of the Equinox user. |

### Communication Profile tab: Presence Profile

You can create Presence profiles only for the default communication profile.

| Name          | Description                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b> | The Presence Services instance that is the home Presence Services server for the user. You must select an instance. As a home server, the Presence Services instance can perform the following for the communication profile: <ul style="list-style-type: none"> <li>Aggregate presence</li> <li>Archive instant messages if the Instant Messages option is enabled</li> </ul> |

*Table continues...*

| Name                                       | Description                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SIP Entity</b>                          | The option to route the SIP-based messages through Presence Services.<br><br>This system selects the SIP entity only if you select a Presence Services instance in the <b>System</b> field. <b>SIP Entity</b> is read-only. If the system cannot identify a SIP entity, an appropriate error message is displayed in the field.                                                         |
| <b>IM Gateway SIP Entity</b>               | The Presence Services instance for the user.                                                                                                                                                                                                                                                                                                                                            |
| <b>Publish Presence with AES Collector</b> | The option that determines if Presence Services must publish presence with AES Collector. The options are: <ul style="list-style-type: none"> <li>• <b>System Default</b></li> <li>• <b>Off</b></li> <li>• <b>On</b></li> </ul> The default is <b>System Default</b> . You can change the default value. You do not require to configure AES Collector in the Presence Services server. |

### Communication Profile tab: Conferencing Profile

| Name                                                         | Description                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Auto-generated Code Length</b>                     | The number of characters in PIN. The default is 6.<br><br>The system displays this field if you select the <b>Auto Generate Participant and Moderator Security Code</b> check box.                                                                             |
| <b>Auto Generate Participant and Moderator Security Code</b> | Select the check box if the system must generate the participant security code and moderator security code for this user.<br><br>Clear the check box to assign a specific participant security code or moderator security code for this user.                  |
| <b>Participant Security Code</b>                             | The participant security code that you assign for this user.<br><br>The system displays this field only when the <b>Auto Generate Participant and Moderator Security Code</b> check box is clear.                                                              |
| <b>Moderator Security Code</b>                               | The moderator security code that you assign for this user.<br><br>The system displays this field if the <b>Auto Generate Participant and Moderator Security Code</b> check box is clear.                                                                       |
| <b>Location</b>                                              | The location of the user. This field is mandatory for non-SIP users without a Session Manager profile and optional for SIP users.<br><br>For SIP users, the system uses the location value from the <b>Home Location</b> field in the Session Manager profile. |
| <b>Template</b>                                              | The Conferencing template that you assign to this user.                                                                                                                                                                                                        |

| Button               | Description                                                                     |
|----------------------|---------------------------------------------------------------------------------|
| <b>Get Templates</b> | Displays the list of Conferencing templates, which you can assign to this user. |

**Communication Profile tab: Work Assignment Profile**

| Name                   | Description          |
|------------------------|----------------------|
| <b>Account</b>         | The account name.    |
| <b>Account Address</b> | The account address. |
| <b>Source</b>          | The source name.     |
| <b>Source Address</b>  | The source address.  |

When you click **Resource Details**, **Account Details**, or **Source Details**, the system displays the Assignment Management page in Work Assignment.

| Button                  | Description                                                                                                                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Resource Details</b> | Displays the Assignment Management page where you can configure assignment targets for the user.<br><br>You can assign resource details to an agent only when the user has the Work Assignment profile assigned to the user. |
| <b>Account Details</b>  | Displays the text box where you can add or modify the account name and account address.<br><br>You can add attributes to the account only when the account is added to the agent.                                            |
| <b>Source Details</b>   | Displays the text box where you can add or modify the source name and source address.<br><br>You can add properties and attributes to the source only when the source already exists.                                        |

**Membership tab: Roles**

| Name                    | Description                                                                                                                                                  |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select check box</b> | Use this check box to select a role. Use the check box displayed in the first column of the header row to select all the roles assigned to the user account. |
| <b>Name</b>             | The name of the role.                                                                                                                                        |
| <b>Description</b>      | A brief description about the role.                                                                                                                          |

| Button                | Description                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------|
| <b>Assign Roles</b>   | Displays the Assign Role page that you can use to assign the roles to the user account. |
| <b>Unassign Roles</b> | Removes the selected role from the list of roles associated with the user account.      |

**Membership tab: Group Membership**

| Name                    | Description                                 |
|-------------------------|---------------------------------------------|
| <b>Select check box</b> | Use this check box to select a group.       |
| <b>Name</b>             | The name of the group.                      |
| <b>Type</b>             | The group type based on the resources.      |
| <b>Hierarchy</b>        | The position of the group in the hierarchy. |
| <b>Description</b>      | A brief description about the group.        |

| Button                   | Description                                                                  |
|--------------------------|------------------------------------------------------------------------------|
| <b>Add To group</b>      | Displays the Assign Groups page that you can use to add the user to a group. |
| <b>Remove From Group</b> | Removes the user from the selected group.                                    |

**Contacts tab: Default Contact List**

| Name               | Description                              |
|--------------------|------------------------------------------|
| <b>Description</b> | A brief description of the contact list. |

**Contacts tab: Associated Contacts**

| Name                    | Description                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last Name</b>        | The last name of the contact.                                                                                                                                          |
| <b>First Name</b>       | The first name of the contact.                                                                                                                                         |
| <b>Scope</b>            | The categorization of the contact based on whether the contact is a public or private contact.                                                                         |
| <b>Speed Dial</b>       | The value specifies whether the speed dial is set for the contact or not.                                                                                              |
| <b>Speed Dial Entry</b> | The reduced number that represents the speed dial number.                                                                                                              |
| <b>Presence Buddy</b>   | The value specifies whether you can monitor the presence information of the contact or not. A false value indicates that you cannot track the presence of the contact. |

| Button      | Description                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------|
| <b>Edit</b> | Displays the Edit Contact List Member page. Use this page to modify the information of the selected contact. |

### Organization

| Name           | Description                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tenant</b>  | The name of the tenant that you select.                                                                                                                                |
| <b>Level 1</b> | The name of the level 1 hierarchy of the tenant organization. For example, Site.<br><br>The tenant administrator provides the hierarchy on the Tenant Management page. |
| <b>Level 2</b> | The name of the level 2 hierarchy of the tenant organization. For example, Department.                                                                                 |
| <b>Level 3</b> | The name of the level 3 hierarchy of the tenant organization. For example, Team.                                                                                       |

 **Note:**

You cannot edit the tenant. If you select a different level 1 for the tenant from the organization hierarchy, the **Level 2** and **Level 3** fields become blank. You can select new values for level 2 and level 3. If you select a different level 2 for the tenant from the organization hierarchy, the **Level 3** field becomes blank. You can select a new value for level 3.

### User Provisioning Rule

| Name                          | Description                                    |
|-------------------------------|------------------------------------------------|
| <b>User Provisioning Rule</b> | The user provisioning rule that you must edit. |

### Identity tab — Identity section

| Name             | Description                                     |
|------------------|-------------------------------------------------|
| <b>Last Name</b> | The last name of the user. For example, Miller. |

| Name                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Login Name</b>    | <p>The login name of the user.</p> <p>With Release 8.1.3, the <b>Login Name</b> field supports the login name with apostrophe ('). For example, aine'mars@xyz.com.</p> <p>The following characters are supported:</p> <ul style="list-style-type: none"> <li>• ,</li> <li>• -</li> <li>• _</li> <li>• ?</li> <li>• %</li> <li>• !</li> <li>• ~</li> <li>• *</li> <li>• (</li> <li>• )</li> <li>• =</li> <li>• +</li> <li>• \$</li> <li>• ,,</li> <li>• ;</li> <li>• .</li> <li>• '.</li> </ul> <p>The login name is not case-sensitive. For example, if you enter JMILLER@AVAYA.COM, the system converts the login name to lowercase, that is, jmiller@avaya.com. However, on the login page, you can enter the login name in uppercase or lowercase.</p> <p>If you log in to the system as admin, you cannot edit the login name.</p> <p> <b>Note:</b></p> <p>To create the user data by using a blank excel template, append the login name with #ProfileSetName in all worksheets, except Basic and Profile Set. The system associates the user records with the communication profile that you have provided. For example, jmiller@avaya.com#ProfileSetName.</p> |
| <b>Email Address</b> | The email address of the user                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Name                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Type</b>              | The authentication type that defines how the system authenticates the user. The options are: <ul style="list-style-type: none"> <li>• <b>Enterprise</b>: Directory servers that are external to System Manager authenticate the user login.</li> <li>• <b>Basic</b>: Avaya authentication service authenticates the user login.</li> </ul> For bulk import of users by using Excel, <b>User Type</b> is always Basic. Therefore, the <b>User Type</b> field remains invisible in the Excel file. |
| <b>Change Password</b>        | Displays two new fields: <b>New Password</b> and <b>Confirm Password</b> .                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>New Password</b>           | The new password to log in to the System Manager web console.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Confirm Password</b>       | The password that you reenter for confirmation.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Source</b>                 | The entity that created this user record. The possible values for this field is either an IP Address/Port, or a name representing an enterprise LDAP, or Avaya.                                                                                                                                                                                                                                                                                                                                  |
| <b>Localized Display Name</b> | The localized display name of a user. The name is typically the localized full name.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Endpoint Display Name</b>  | The full text name of the user represented in ASCII. The display name supports displays that cannot handle localized text, for example, some endpoints.                                                                                                                                                                                                                                                                                                                                          |
| <b>Title</b>                  | The personal title that is set to address a user. The title is typically a social title and not the work title. For example, Mr.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Language Preference</b>    | The preferred written or spoken language of the user. For example, English.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Time Zone</b>              | The preferred time zone of the user. For example, (+05:30) Chennai, Kolkata, Mumbai, New Delhi.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Employee ID</b>            | The employee number of the user. For example, 20081234.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Department</b>             | The department to which the user belongs. For example, Human Resources.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Company</b>                | The organization where the user works. For example, Avaya Inc.                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Identity tab — Address section

| Name                | Description                                                                                                                    |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Time Zone</b>    | The preferred time zone of the user. For example, (+05:30) Chennai, Kolkata, Mumbai, New Delhi.                                |
| <b>Department</b>   | The department to which the user belongs. For example, Human Resources.                                                        |
| <b>Address Type</b> | The type of address. The options are: <ul style="list-style-type: none"> <li>• <b>Office</b></li> <li>• <b>Home</b></li> </ul> |
| <b>Street</b>       | The name of the street. For example, Magarpatta.                                                                               |

*Table continues...*

| Name               | Description                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>City</b>        | The name of the city or town. For example, Pune.                                                                                                 |
| <b>Postal Code</b> | The postal code used by postal services to route mail to a destination. For example, 411028. For United States, the postal code is the Zip code. |
| <b>Province</b>    | The full name of the province. For example, Maharashtra.                                                                                         |
| <b>Country</b>     | The name of the country. For example, India.                                                                                                     |

| Button                       | Description                                                              |
|------------------------------|--------------------------------------------------------------------------|
| <b>New</b>                   | Displays the Add Address page to add the address details.                |
| <b>Edit</b>                  | Displays the Edit Address page to modify the address.                    |
| <b>Delete</b>                | Deletes the selected address.                                            |
| <b>Choose Shared Address</b> | Displays the Choose Address where you choose a shared or common address. |

### Identity tab — Localized Names section

| Name                | Description                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------|
| <b>Language</b>     | The localized language for displaying the user name. For example, English. You must select the language. |
| <b>Display Name</b> | The user name in the localized language you choose. For example, John Miller.                            |

| Button        | Description                                                                   |
|---------------|-------------------------------------------------------------------------------|
| <b>New</b>    | Displays fields that you can use to create a new localized name for the user. |
| <b>Edit</b>   | Displays fields that you can use to modify the localized name of the user.    |
| <b>Delete</b> | Deletes the localized names that you select for the user.                     |
| <b>Add</b>    | Adds or edits the localized name of the user.                                 |
| <b>Cancel</b> | Cancels the addition or edits of the localized name.                          |

### Communication Profile tab — Communication Profile

Use this section to create, modify, and delete a communication profile of the user. Each communication profile can contain one or more communication addresses for a user.

| Name                           | Description                                                                                                                                                                                                         |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Calculate Route Pattern</b> | The option to automatically select the route pattern based on the primary or secondary Session Manager configured in the <b>Session Manager Communication Profile</b> .                                             |
| <b>Sip Trunk</b>               | The system makes this field available only for the SIP set type.<br><br>If you select the <b>Calculate Route Pattern</b> check box, the system populates the <b>Sip Trunk</b> field, and makes the field read-only. |

*Table continues...*

| Name                                                  | Description                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allow H.323 and SIP Endpoint Dual Registration</b> | The option to register an H.323 endpoint and a SIP endpoint together at the same time to the same extension. For more information about the SIP and H.323 dual registration feature, see <i>Avaya Aura® Communication Manager Feature Description and Implementation</i> on the Avaya Support website at <a href="http://support.avaya.com">http://support.avaya.com</a> . |

| Button        | Description                                                                          |
|---------------|--------------------------------------------------------------------------------------|
| <b>New</b>    | Creates a new communication profile for the user.                                    |
| <b>Delete</b> | Deletes the selected communication profile.                                          |
| <b>Done</b>   | Saves the communication profile information that you updated or added for a profile. |
| <b>Cancel</b> | Cancels the operation of adding a communication profile.                             |

The system enables the following fields when you click **New** in the Communication Profile section.

| Name           | Description                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------|
| <b>Name</b>    | The name of the communication profile for the user.                                                     |
| <b>Default</b> | The profile that is made default as the active profile. There can be only one active profile at a time. |

### Communication Profile tab — Communication Address

Use this section to create, modify, and delete the communication address of a user. Each communication profile can contain one or more communication addresses for a user.

| Name          | Description                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>   | The type of handle.                                                                                                          |
| <b>Handle</b> | A unique communication address of the user. Communication Manager Release 7.1.2 and later also support alphanumeric handles. |
| <b>Domain</b> | The name of the domain with which the handle is registered.                                                                  |

| Button        | Description                                                  |
|---------------|--------------------------------------------------------------|
| <b>New</b>    | To add a new communication address.                          |
| <b>Edit</b>   | To edit the information of a selected communication address. |
| <b>Delete</b> | To delete the selected communication address.                |

The page displays the following fields when you click **New** or **Edit** in the Communication Address section.

| Name                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>                    | <p>The type of handle. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Avaya SIP</b>: Indicates that the handle supports Avaya SIP-based communication.</li> <li>• <b>Avaya E.164</b>: Indicates that the handle refers to an E.164 formatted address. E.164 numbers can have maximum 13 digits and are usually written with a + prefix.</li> <li>• <b>Microsoft SIP</b>: Indicates that the handle supports SIP-based communication.</li> <li>• <b>Microsoft Exchange</b>: Indicates that the handle is an email address and supports communication with Microsoft SMTP server.</li> <li>• <b>Lotus Notes</b>: Indicates that the handle is for Lotus Notes and domino calendar.</li> <li>• <b>IBM Sametime</b>: Indicates that the handle is for IBM Sametime. The address must be in the DN=IBMHandle format.</li> <li>• <b>Avaya Presence/IM</b>: Indicates that the handle is an address that is used for Extensible Messaging and Presence Protocol (XMPP)-based Internet Messaging (IM) services and XMPP or Session Initiation Protocol-based (SIP) Presence services.</li> </ul> <p> <b>Note:</b></p> <p>To create the Presence communication profile, you must select <b>Avaya Presence/IM</b> and provide the communication address.</p> <ul style="list-style-type: none"> <li>• <b>GoogleTalk</b>: Indicates that the handle supports XMPP-based communication with the Google Talk service.</li> <li>• <b>Other Email</b>: Indicates that the handle is an email address other than MS Exchange email addresses.</li> <li>• <b>Other SIP</b>: Indicates that the handle supports SIP-based communication other than the listed ones.</li> <li>• <b>Other XMPP</b>: Indicates that the handle supports XMPP-based communication other than the listed ones.</li> <li>• <b>Work Assignment</b>: Indicates that the handle supports accounts that can be assigned to an agent for Work Assignment.</li> </ul> |
| <b>Fully Qualified Address</b> | The fully qualified domain name or uniform resource identifier. The address can be an email address, IM user, or an address of a communication device by using which the user can send or receive messages. You must provide the fully qualified address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Button        | Description                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------|
| <b>Add</b>    | Saves the new communication address or modified communication address information in the database. |
| <b>Cancel</b> | Cancels the addition of communication address.                                                     |

**Communication Profile tab:— Session Manager****\* Note:**

The system displays the following fields only if a communication profile of the user exists for the product:

| Name                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Primary Session Manager</b>                                  | The instance that you want to use as the home server for the currently displayed communication profile. As a home server, the selected primary Session Manager instance is used as the default access point for connecting devices associated with the communication profile to the Avaya Aura <sup>®</sup> network. You must select the primary Session Manager server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Secondary Session Manager</b>                                | The Session Manager instance that you select as the secondary Session Manager. It provides continued service to SIP devices associated with this communication profile when the primary Session Manager server becomes unavailable. A selection is optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Survivability Server</b>                                     | <p>For local survivability, you can specify a survivability server to provide survivability communication services for devices associated with a communication profile when the local connectivity to Session Manager instances in Avaya is lost. If you select Branch Session Manager, and the termination and origination application sequences contain a Communication Manager application, sequencing to this application continues, locally, to Communication Manager survivable remote server resident with Branch Session Manager. A selection is optional.</p> <p><b>* Note:</b></p> <p>If a termination or origination application sequence contains a Communication Manager application, the Communication Manager instance associated with the application must be the main server for the Communication Manager survivable remote server that resides with Branch Session Manager.</p> <p>After typing minimum of 3 characters, wait for three seconds to capture the final keyword, and fetch the required results.</p> |
| <b>Max. Simultaneous Devices</b>                                | The maximum number of endpoints that you can register at a time by using this communication profile. If you register more than one endpoint, all the endpoints receive calls simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Block New Registration When Maximum Registrations Active</b> | If you select the check box and an endpoint attempts to register using this communication profile after the registration requests exceed the administered limit, the system denies any new registrations with Session Manager. The system sends a warning message and stops the SIP service to the endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Name                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Origination Application Sequence</b> | <p>The application sequence that the system invokes when routing calls from this user. A selection is optional.</p> <p> <b>Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p> |
| <b>Termination Application Sequence</b> | <p>The application sequence that is invoked when the system routes calls to this user. A selection is optional.</p> <p> <b>Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p> |
| <b>Home Location</b>                    | <p>The home location to support mobility for the currently displayed user. Session Manager uses the home location specifically when the IP address of the calling phone does not match the IP Address Pattern of any location. You must specify a value.</p>                                                                                                                                                                        |
| <b>Conference Factory Set</b>           | <p>The conference factory set to enable media capability-based call routing to the Conferencing SIP entities.</p> <p>Use the <b>Session Manager &gt; Application Configuration &gt; Conference Factories</b> webpage to administer the Conference Factory Sets.</p>                                                                                                                                                                 |

### Communication Profile tab: Avaya Breeze® platform Profile

| Name                   | Description                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Service Profile</b> | The profile that you assign to the user. The user can gain access to the service contained in the profile. |

### Communication Profile tab — CM Endpoint Profile

 **Note:**

The system displays these fields only if a Communication Manager Endpoint profile exists for the user.

| Name/Button                   | Description                                                                                                                                    |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                 | The Communication Manager system on which you add the endpoint. You must select the system.                                                    |
| <b>Profile Type</b>           | The type of Communication Manager Endpoint profile that you create. You must select the profile type.                                          |
| <b>Use Existing Endpoints</b> | The existing endpoint extension to associate with this profile. If you do not select this check box, the system uses the available extensions. |

| Name/Button              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Extension</b>         | <p>The extension of the endpoint that you associate this profile with. You must select the extension.</p> <p>The field lists the endpoints, existing or available, based on the option you selected in the <b>Use Existing Endpoints</b> check box.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Template</b>          | The template, system defined or user defined, that you associate with the endpoint. Select the template based on the set type you add.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Set Type</b>          | The set type of the endpoint you associate with. When you select a template, the system populates the corresponding set types.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Security Code</b>     | The security code for authorized access to the endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Port</b>              | <p>The relevant port for the set type you select. You must select the port.</p> <p>The field lists the possible ports based on the selected set type.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Voice Mail Number</b> | <p>The voice mail number of the endpoint you associate with.</p> <p> <b>Note:</b></p> <p>You must clear Local Device Services Data on all Avaya Aura® Web Gateway nodes if you change the value of <b>Voice Mail Number</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Preferred Handle</b>  | <p>Numeric only handles, SIP handles, or nonSIP handles, that are administered for a user.</p> <p>The <b>Preferred Handle</b> field is optional. Select numeric handle for alphanumeric support. By default, the field is blank.</p> <p>If the type of SIP entity is Communication Manager, Session Manager uses the preferred handle in the CM Endpoint profile. By default, for a SIP station, Communication Manager uses the extension number as the phone number entry on an OPS station-mapping table. If your enterprise dial plan has SIP handles that are different from the Communication Manager extension, then use the <b>Preferred Handle</b> field to change the phone number entry on the OPS station-mapping table on the Communication Manager.</p> <p>To modify the phone number entry, the Communication Address in System Manager should have a SIP handle. In the CM Endpoint Communication Profile, set the <b>Preferred Handle</b> field to the SIP handle format. After you click <b>Commit</b>, System Manager sets the <b>Phone Number</b> field in the OPS station-mapping table on Communication Manager to the SIP handle format. If you do not need this feature, then set the <b>Preferred Handle</b> value to <b>None</b>.</p> |
| <b>SIP URI</b>           | A unique alphanumeric communication address of the user to make and receive voice or video calls. The <b>SIP URI</b> address can be: <username-projectname>@<xyz.com>.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Attendant</b>         | <p>The option to enable the attendant feature on the endpoint. If you select this check box, you can administer the endpoint as an attendant.</p> <p>When you select the 9641SIP template type from <b>Template</b>, the system enables the <b>Attendant</b> check box.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Enhanced Callr-Info display for 1-line phones</b>                       | <p>The option to activate the enhanced Callr-info operation on the phone.</p> <p>The <b>Enhanced Callr-Info display for 1-line phones</b> field on the station form is valid for the following set types:</p> <ul style="list-style-type: none"> <li>• 1603, 1608, 1616, 1408, 1416</li> <li>• 2402, 2410, 2420</li> <li>• 4606, 4612, 4612CL, 4624, 4602, 4602+, 4630, 4610, 4622, 4620, 4621, 4625,</li> <li>• 6402D, 6408D, 6408D+, 6416D+, 6424D+, 607A1</li> <li>• 7506D, 7507D</li> <li>• 8405D+, 8410D, 8405D, 8411D</li> <li>• 9404, 9408, 9601, 9601+, 9610, 9620, 9621, 9608, 9611, 9630, 9640, 9641, 9650</li> </ul> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>No</b>: Does not change the callr-info interactions with the connected phone. The default setting.</li> <li>• <b>Yes</b>: Activates the enhanced Callr-info operation including the application of the existing feature related system parameters. Clear Callr-Info option settings of leave-ACW, next-call, and on-call-release. If the <b>callr-info</b> button is not assigned to the phone on the station form, <b>Enhanced Callr-Info display for 1-line phones</b> does not apply.</li> </ul> |
| <b>Delete Endpoint on Unassign of Endpoint from User or on Delete User</b> | <p>The option to specify whether to delete the endpoint from the Communication Manager device when you remove the association between the endpoint and the user or delete the user.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Override Endpoint Name and Localized Name</b>                           | <p>The option to override the following endpoint names:</p> <ul style="list-style-type: none"> <li>• The endpoint name on Communication Manager with the value you configured on the Manage users page during synchronization.</li> </ul> <p>If you clear the check box, the system does not override the endpoint name on Communication Manager with the name you configured in System Manager during synchronization.</p> <ul style="list-style-type: none"> <li>• The localized display name on the Manage Users page in the <b>Localized Display Name</b> field of Communication Manager. If you clear the check box, the system does not override the localized display name in the <b>Localized Display Name</b> field.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Communication Profile tab - CS1000 Endpoint Profile

| Field         | Description                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------|
| <b>System</b> | The system that will be the element manager of the CS 1000 endpoint profile. You must select the system. |

*Table continues...*

| Field                                 | Description                                                                                                                                                                                                      |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Target</b>                         | The system customer number of the CS 1000 system. You must select the target.<br>The system displays the field only when you select <b>Add new</b> .                                                             |
| <b>Template</b>                       | The phone or endpoint template that you can choose for the user. The element manager maintains all templates. You must select a template.<br>The system displays the field only when you select <b>Add new</b> . |
| <b>Update</b>                         | The station profile information updated for the user. When you click <b>Update</b> , the system takes you to the element manager cut-through for the updates.                                                    |
| <b>Service Details</b>                | The service details of endpoints, such as set type, after phone creation.                                                                                                                                        |
| <b>Primary DN</b>                     | The primary directory number of the phone. You can enter only numeric values in this field.<br>The system displays the field only when you select <b>Add new</b> .                                               |
| <b>Include in Corporate Directory</b> | The option to add this profile to the CS 1000 Corporate Directory feature.                                                                                                                                       |

### Communication Profile tab — Messaging Profile

 **Note:**

The system displays the following fields only if you can configure a messaging profile for the user

| Name                                     | Description                                                                                                                                                                                                                                                                                                      |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                            | The messaging system on which you add the subscriber. You must select the system.                                                                                                                                                                                                                                |
| <b>Use Existing Subscriber on System</b> | The option to specify whether to use an existing subscriber mailbox number to associate with this profile.                                                                                                                                                                                                       |
| <b>Mailbox Number</b>                    | The mailbox number of the subscriber. You must select the mailbox number.<br>The field takes the existing mailbox number that you associate with this profile. The value in the field is valid only if you select the <b>Use Existing Subscriber on System</b> check box.                                        |
| <b>Messaging Editor</b>                  | The Messaging application where you can edit or view details of the profile of the messaging endpoint.<br>After you save the changes in the Messaging system, the system does not update the modified data on the device or database until you commit the changes on the User Profile   Edit   <User Name> page. |
| <b>Template</b>                          | The system-defined or user-defined template that you associate with the subscriber.                                                                                                                                                                                                                              |
| <b>Password</b>                          | The password for logging in to the mailbox. You must provide the password.                                                                                                                                                                                                                                       |

*Table continues...*

| Name                                                                           | Description                                                                                                                                                                            |
|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Delete Subscriber on Unassign of Subscriber from User or on Delete User</b> | The option to specify whether to delete the subscriber mailbox from the Messaging device or Communication System Management when you remove this Messaging profile or delete the user. |

### Communication Profile tab: Avaya Messaging Profile

| Name                                     | Description                                                                                                                                                                                                                                                           |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Officelinx System</b>                 | The Avaya Messaging system to which you add a mailbox.                                                                                                                                                                                                                |
| <b>Refresh</b>                           | The option to get information about company, departments, and feature groups from Avaya Messaging and save locally on System Manager for future use.<br><br>You do not require to refresh for every user.                                                             |
| <b>Mailbox Number</b>                    | The mailbox number of the subscriber.                                                                                                                                                                                                                                 |
| <b>Numeric Password</b>                  | The numeric password that is used to log in to the Avaya Messaging system.                                                                                                                                                                                            |
| <b>Confirm Numeric Password</b>          | The numeric password that you retype to confirm.                                                                                                                                                                                                                      |
| <b>Application User Password</b>         | The password that is used to gain access to non-telephone applications, such as Web Client, iLink Pro, iLink Pro Mobile, and iLink Pro Desktop.                                                                                                                       |
| <b>Confirm Application User Password</b> | The password that you retype to confirm.                                                                                                                                                                                                                              |
| <b>Company</b>                           | The name of the company to which the user belongs.                                                                                                                                                                                                                    |
| <b>Department</b>                        | The department to which the user belongs.                                                                                                                                                                                                                             |
| <b>Feature Group</b>                     | The feature group name that determines the rules for the mailboxes associated with it.                                                                                                                                                                                |
| <b>Capability</b>                        | The type of functionality that the user contains. The values are: <ul style="list-style-type: none"> <li>• <b>Standard</b></li> <li>• <b>Fax</b></li> <li>• <b>Messaging</b></li> <li>• <b>Collaboration</b></li> <li>• <b>Messaging and Collaboration</b></li> </ul> |
| <b>Domain Account Name</b>               | The mailbox NT account name of the Avaya Messaging profile.                                                                                                                                                                                                           |
| <b>Synchronization User Name</b>         | The account name that is used to gain access to the email server, for example, Microsoft Exchange and Google Gmail.                                                                                                                                                   |

 **Note:**

Only one-way update is supported for Officelinx elements. If you make any change directly on Officelinx, it does not reflect on System Manager. If you edit the user from System Manager, it overrides the changes you made directly on Officelinx.

## Communication Profile tab — IP Office Endpoint Profile

Use this profile to assign a new or an existing user to a System Manager device in User Management.

While adding a user, if you choose to assign a CM endpoint profile and an IP Office endpoint profile to the user, then the system uses the IP Office endpoint profile as the survivability option for the CM endpoint profile. That is, the endpoint extension used in the CM endpoint profile is also used for creating an IP Office endpoint profile so that when Communication Manager is unavailable, the IP Office device can serve the extension.

### \* Note:

If a Communication Manager endpoint profile is present while adding or editing a user, the user administration functions in the centralized mode. If a Communication Manager endpoint profile is present, the user administration functions in the distributed mode.

Commit the Communication Manager endpoint profile and the Session Manager endpoint profile before you add an IP Office endpoint profile for a centralized user.

| Name/Button                            | Description                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                          | The list of IP Office device names from which you can select the IP Office device that you associate with the user. You must select the template.                                                                                                                                                                           |
| <b>Template</b>                        | The list of user templates from which you can select your preferred template to set the user configurations.                                                                                                                                                                                                                |
| <b>Use Existing Extension</b>          | Select the check box to use an existing endpoint extension to associate with this profile. If you do not select this check box, the system uses the available extensions.                                                                                                                                                   |
| <b>Extension</b>                       | The extension of the endpoint you associate with. You must select the extension.<br><br>The field lists the endpoints, existing or available, based on the option you selected in the <b>Use Existing Endpoints</b> check box.                                                                                              |
| <b>Endpoint Editor</b> button          | The option to start the IP Office application, where you can edit or view the details of the IP Office endpoint.<br><br>After you save the changes in IP Office manager, the system does not update the modified data on the device or database until you commit the changes on the User Profile   Edit   <User Name> page. |
| <b>Module-Port</b>                     | The module port combination list for IP Office analog extensions. You must select <b>Module-Port</b> for centralized users with Set Type as <b>Analog</b> .                                                                                                                                                                 |
| <b>Set Type</b>                        | The set type for the IP Office endpoint profile. By default, the <b>Set Type</b> field is disabled. If you select a template, the system populates the set type.                                                                                                                                                            |
| <b>Delete Extension On User Delete</b> | The option to delete the extension associated with the user while deleting the user. By default, this check box is clear. This option is available for communication profiles associated with <b>Analog</b> and <b>Digital</b> set types.                                                                                   |

## Communication Profile tab: Equinox Conferencing

| Name                         | Description                                  |
|------------------------------|----------------------------------------------|
| <b>Equinox User Password</b> | The Equinox user password.                   |
| <b>Virtual Room Number</b>   | The virtual room number of the Equinox user. |

## Communication Profile tab — Presence Profile

| Name                                       | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                              | <p>The Presence Services instance that is the home Presence Services server for the user. You must select an instance. As a home server, the Presence Services instance can perform the following for the communication profile:</p> <ul style="list-style-type: none"> <li>• Aggregate presence</li> <li>• Archive instant messages if the Instant Messages option is enabled</li> </ul>            |
| <b>SIP Entity</b>                          | <p>The option to route the SIP-based messages through Presence Services. This system selects the SIP entity only if you select a Presence Services instance in the <b>System</b> field. <b>SIP Entity</b> is read-only. If the system cannot identify a SIP entity, an appropriate error message is displayed in the field.</p>                                                                      |
| <b>IM Gateway SIP Entity</b>               | The Presence Services instance for the user.                                                                                                                                                                                                                                                                                                                                                         |
| <b>Publish Presence with AES Collector</b> | <p>The option that determines if Presence Services must publish presence with AES Collector. The options are:</p> <ul style="list-style-type: none"> <li>• <b>System Default</b></li> <li>• <b>Off</b></li> <li>• <b>On</b></li> </ul> <p>The default is <b>System Default</b>. You can change the default value. You do not require to configure AES Collector in the Presence Services server.</p> |

## Communication Profile tab: Conferencing Profile

| Name                                                         | Description                                                                                                                                                                                                                                          |
|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Auto-generated Code Length</b>                     | <p>The number of characters in PIN. The default is 6.</p> <p>The system displays this field if you select the <b>Auto Generate Participant and Moderator Security Code</b> check box.</p>                                                            |
| <b>Auto Generate Participant and Moderator Security Code</b> | <p>Select the check box if the system must generate the participant security code and moderator security code for this user.</p> <p>Clear the check box to assign a specific participant security code or moderator security code for this user.</p> |
| <b>Participant Security Code</b>                             | <p>The participant security code that you assign for this user.</p> <p>The system displays this field only when the <b>Auto Generate Participant and Moderator Security Code</b> check box is clear.</p>                                             |

*Table continues...*

| Name                           | Description                                                                                                                                                                                                                                                    |

*Table continues...*

| Name                  | Description                                                                                                                                                            |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Presence Buddy</b> | The value specifies whether you can monitor the presence information of the contact or not. A false value indicates that you cannot track the presence of the contact. |

| Button             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Edit</b>        | Displays the Edit Contact List Member page. Use this page to modify the information of the selected contact.                                                                                                                                                                                                                                                                                                                                       |
| <b>Add</b>         | <p>Displays the Attach Contacts page. Use this page to select one or more contacts from the list of contacts.</p> <p>In the Multi Tenancy environment, when the tenant administrator of a tenant creates or updates the user, the administrator can attach only the following contacts:</p> <ul style="list-style-type: none"> <li>• Private contacts of the user</li> <li>• Public contacts</li> <li>• Users who belong to that tenant</li> </ul> |
| <b>Remove</b>      | Removes one or more selected contacts from the list of the associated contacts.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Filter menu</b> | <p>You can find the <b>Filter menu</b> icon next to the name of each column.</p> <p>Filters the data based on the search criteria.</p>                                                                                                                                                                                                                                                                                                             |

## Contacts tab — Private Contacts

Use this section to add new private contacts, modify and deletes existing contacts.

| Name                   | Description                              |
|------------------------|------------------------------------------|
| <b>Last Name</b>       | The last name of the private contact.    |
| <b>First Name</b>      | The first name of the contact.           |
| <b>Display Name</b>    | The display name of the private contact. |
| <b>Contact Address</b> | The address of the private contact.      |
| <b>Description</b>     | A brief description about the contact.   |

| Button             | Description                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Edit</b>        | Displays the Edit Private Contact page. Use this page to edit the information of the contact you selected.                             |
| <b>New</b>         | Displays the <b>New Private Contact</b> page. Use this page to add a new private contact.                                              |
| <b>Delete</b>      | Deletes the selected contacts.                                                                                                         |
| <b>Filter menu</b> | <p>You can find the <b>Filter menu</b> icon next to the name of each column.</p> <p>Filters the data based on the search criteria.</p> |

## Common buttons

| Button                       | Description                                                                                                                                                                                                                                                                                                                      |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Commit &amp; Continue</b> | Saves your changes and retains you on the same page for further modifications.                                                                                                                                                                                                                                                   |
| <b>Commit</b>                | <p>Modifies the user account and takes you back to the User Management or User Profile   View   &lt;User Name&gt; page.</p> <p> <b>Note:</b></p> <p>While restoring a deleted user, use the <b>Commit</b> button to restore a deleted user.</p> |
| <b>Cancel</b>                | Cancels the operation of modifying the user information and takes you back to the User Management or User Profile   View   <User Name> page.                                                                                                                                                                                     |

## User Profile | View | <User Name> field descriptions

### Organization

| Name           | Description                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tenant</b>  | The name of the tenant that you select.                                                                                                                                       |
| <b>Level 1</b> | <p>The name of the level 1 hierarchy of the tenant organization. For example, Site.</p> <p>The tenant administrator provides the hierarchy on the Tenant Management page.</p> |
| <b>Level 2</b> | The name of the level 2 hierarchy of the tenant organization. For example, Department.                                                                                        |
| <b>Level 3</b> | The name of the level 3 hierarchy of the tenant organization. For example, Team.                                                                                              |

### User Provisioning Rule

| Name                          | Description                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>User Provisioning Rule</b> | <p>The name of the user provisioning rule.</p> <p>You can provide only one user provisioning rule.</p> |

 **Note:**

When you use the user provisioning rule to create a user, the system populates the values of user attributes from the user provisioning rule.

**Identity tab — Identity section**

| Name                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last Name</b>                      | The last name of the user. For example, Miller.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Last Name (Latin Translation)</b>  | <p>The user-preferred last name that the system must display on the endpoints. For example, Miller.</p> <p>Typically, the name is in the written or spoken language of the user.</p> <p> <b>Note:</b></p> <p>When you create a user, if the <b>Last Name (Latin Translation)</b> and <b>First Name (Latin Translation)</b> fields are:</p> <ul style="list-style-type: none"> <li>• Blank, the system displays the last name and first name in the fields. The values change when the last and first names change.</li> <li>• Filled, the values remain the same even after you change the values in the <b>Last Name</b> and <b>First Name</b> fields.</li> </ul> |
| <b>First Name</b>                     | The first name of the user. For example, John.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>First Name (Latin Translation)</b> | <p>The user-preferred first name that the system must display on the endpoints. For example, John.</p> <p>Typically, the name is in the written or spoken language of the user.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Middle Name</b>                    | The middle name of the user, if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>                    | A brief description of the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Status</b>                         | The login status of the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Update Time</b>                    | The time when the user details were last modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Login Name</b>                     | <p>The unique system login name given to the user. The login name takes the form of username@domain. You use the login name to create the user's primary handle.</p> <p>The login name is not case-sensitive. For example, if you enter JMILLER@AVAYA.COM, the system converts the login name to lowercase, that is, jmiller@avaya.com. However, on the login page, you can enter the login name in uppercase or lowercase.</p> <p>You cannot edit the <b>Login Name</b> field for users with the login name admin.</p>                                                                                                                                                                                                                             |
| <b>Email Address</b>                  | The email address of the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

*Table continues...*

| Name                          | Description                                                                                                                                                                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authentication Type</b>    | Authentication type defines how the system performs user authentication. The options are: <ul style="list-style-type: none"> <li>• <b>Enterprise:</b> The enterprise authenticates the user login.</li> <li>• <b>Basic:</b> Avaya Authentication Service authenticates the user login.</li> </ul> |
| <b>Source</b>                 | The entity that created this user record. The options are IP Address/Port, or a name representing an enterprise LDAP, or Avaya.                                                                                                                                                                   |
| <b>Localized Display Name</b> | The localized display name of a user. Usually, the name is the localized full name.                                                                                                                                                                                                               |
| <b>Endpoint Display Name</b>  | The full text name of the user represented in ASCII. The field supports display names that cannot handle localized text, for example, some endpoints.                                                                                                                                             |
| <b>Title</b>                  | The personal title for address a user. Usually, the title is a social title and not the work title.                                                                                                                                                                                               |
| <b>Language Preference</b>    | The preferred written or spoken language of the user.                                                                                                                                                                                                                                             |
| <b>Time Zone</b>              | The preferred time zone of the user.                                                                                                                                                                                                                                                              |
| <b>Employee ID</b>            | The employee number for the user.                                                                                                                                                                                                                                                                 |
| <b>Department</b>             | The department to which the user belongs.                                                                                                                                                                                                                                                         |
| <b>Company</b>                | The organization where the user works.                                                                                                                                                                                                                                                            |

### Identity tab — Address section

| Name                | Description                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>         | The unique label that identifies the address.                                                                               |
| <b>Address Type</b> | The type of the address. Types of addresses are: <ul style="list-style-type: none"> <li>• Office</li> <li>• Home</li> </ul> |
| <b>Street</b>       | The name of the street.                                                                                                     |
| <b>City</b>         | The name of the city or town.                                                                                               |
| <b>Postal Code</b>  | The postal code used by postal services to route mail to a destination. In United States, this is Zip code.                 |
| <b>Province</b>     | The full name of the province.                                                                                              |
| <b>Country</b>      | The name of the country.                                                                                                    |

**Identity tab — Localized Names section**

| Name         | Description                                           |
|--------------|-------------------------------------------------------|
| Language     | The localized languages for displaying the user name. |
| Display Name | The user name in the localized language you choose.   |

| Button | Description                                          |
|--------|------------------------------------------------------|
| New    | Allows you to add a new localized name for the user. |
| Edit   | Allows you to edit the localized name for the user.  |
| Delete | Deletes the localized names you select for the user. |
| Add    | Adds or edits the localized name for the user.       |
| Cancel | Cancels your add or edit of the localized name.      |

**Communication Profile tab — Communication Profile**

Use this section to create, modify, and delete a communication profile of the user. Each communication profile can contain one or more communication addresses for a user.

| Name                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Communication Profile Password | <p>The communication profile password.</p> <p>The field is available only if you enable the communication profile. The password policy is configured on the <b>Users &gt; User Management &gt; Communication Profile Password Policy</b> page.</p> <p>When you provide the communication password value during bulk edit of users, the system overwrites any existing communication profile passwords of the user.</p> <p>For information about password policy, see “Communication profile password policy”.</p> |

*Table continues...*

| Name            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Generate</b> | <p>The option to automatically generate the communication profile password.</p> <p>System Manager sends the generated password to the user if you:</p> <ul style="list-style-type: none"> <li>Set the email configuration properties on the <b>Services &gt; Configurations &gt; Settings &gt; SMGR</b> page.</li> </ul> <p>For more information, see “Configuring email properties”.</p> <ul style="list-style-type: none"> <li>Configure <b>Email Address</b> on the <b>Identity</b> tab.</li> </ul> <p>By default, the <b>Generate</b> link is available for creating a new user account.</p> <p>The <b>Edit</b> link is available for modifying user accounts. When you click the <b>Edit</b> link, the system displays <b>Confirm Password</b> along with the <b>Generate</b> and <b>Cancel</b> links.</p> |
| <b>Name</b>     | The name of the communication profile that you must select .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Button        | Description                                                                          |
|---------------|--------------------------------------------------------------------------------------|
| <b>New</b>    | Creates a new communication profile for the user.                                    |
| <b>Delete</b> | Deletes the selected communication profile.                                          |
| <b>Done</b>   | Saves the communication profile information that you updated or added for a profile. |
| <b>Cancel</b> | Cancels the operation of adding a communication profile.                             |

The system enables the following fields when you click **New** in the Communication Profile section.

### Communication Profile tab — Communication Address section

| Name          | Description                                                 |
|---------------|-------------------------------------------------------------|
| <b>Type</b>   | The type of the handle.                                     |
| <b>Handle</b> | The unique communication address for the user.              |
| <b>Domain</b> | The name of the domain with which the handle is registered. |

### Communication Profile tab — Session Manager section

#### **Note:**

The system displays the following fields only if a communication profile of the user exists for the product:

| Name                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Primary Session Manager</b>                                  | The Session Manager instance that you use as home server for the currently displayed communication profile. As a home server, the selected primary Session Manager instance is used as the default access point to connect devices that are associated with the communication profile to the Avaya network. A selection is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Secondary Session Manager</b>                                | If you select a secondary Session Manager instance, this Session Manager provides continued service to SIP devices associated with this Communication Profile when the primary Session Manager becomes unavailable. A selection is optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Survivability Server</b>                                     | <p>For local survivability, a survivability server that you can specify to provide survivability communication services for devices associated with a communication profile if local connectivity to Session Manager instances in Avaya Aura® is lost. If Branch Session Manager is selected, and the termination and origination application sequences contain a Communication Manager application, sequencing to this application continues, locally, to the Communication Manager survivable remote server resident with Branch Session Manager. A selection is optional.</p> <p> <b>Note:</b></p> <p>If a termination or origination application sequence contains a Communication Manager application, the Communication Manager associated with the application must be the main Communication Manager for the Communication Manager survivable remote server that is resident with Branch Session Manager.</p> |
| <b>Max. Simultaneous Devices</b>                                | The maximum number of endpoints that you can register at a time by using this communication profile. If you register more than one endpoint, all the endpoints receive calls simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Block New Registration When Maximum Registrations Active</b> | If you select the check box and an endpoint attempts to register using this communication profile after the registration requests exceed the administered limit, the system denies any new registrations with Session Manager. The system sends a warning message and stops the SIP service to the endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Name                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Origination Application Sequence</b> | <p>An application sequence that will be invoked when the system routes the calls from this user. A selection is optional.</p> <p> <b>Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p> |
| <b>Termination Application Sequence</b> | <p>An application sequence that will be invoked when calls are routed to this user. A selection is optional.</p> <p> <b>Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p>              |
| <b>Conference Factory Set</b>           | <p>The conference factory set to enable media capability-based call routing to the Conferencing SIP entities.</p> <p>Use the <b>Session Manager &gt; Application Configuration &gt; Conference Factories</b> webpage to administer the Conference Factory Sets.</p>                                                                                                                                                                           |
| <b>Home Location</b>                    | <p>The location that Session Manager uses when the IP address of the calling phone does not match any IP address pattern of any location. This field is specified to support mobility of the user.</p>                                                                                                                                                                                                                                        |

### Communication Profile tab: Avaya Breeze® platform Profile

| Name                   | Description                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Service Profile</b> | The profile that you assign to the user. The user can gain access to the service contained in the profile. |

### Communication Profile tab — CM Endpoint Profile

 **Note:**

The system displays these fields only if a Communication Manager Endpoint profile exists for the user.

| Name/Button              | Description                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>            | Communication Manager on which you add the endpoint.<br><br>The Communication Manager system on which you add the endpoint. You must select the system.                                                                                                                                                                                                |
| <b>Profile Type</b>      | The type of the profile for the user.                                                                                                                                                                                                                                                                                                                  |
| <b>Extension</b>         | The extension of the endpoint that you associate this profile with. You must select the extension.                                                                                                                                                                                                                                                     |
| <b>View Endpoint</b>     | The list of existing or available endpoints based on the selection of the <b>Use Existing Endpoints</b> check box.                                                                                                                                                                                                                                     |
| <b>Set Type</b>          | The set type of the endpoint you associate with. When you select a template, the system populates the corresponding set types.                                                                                                                                                                                                                         |
| <b>Security Code</b>     | The security code for authorized access to the endpoint.                                                                                                                                                                                                                                                                                               |
| <b>Port</b>              | The relevant port for the set type you select. You must select the port.                                                                                                                                                                                                                                                                               |
| <b>Voice Mail Number</b> | The voice mail number of the endpoint you associate with.<br><br> <b>Note:</b><br><br>You must clear Local Device Services Data on all Avaya Aura® Web Gateway nodes if you change the value of <b>Voice Mail Number</b> .                                           |
| <b>Preferred Handle</b>  | Numeric only handles, SIP handles, or nonSIP handles, that are administered for a user.<br><br>The <b>Preferred Handle</b> field is optional. Select numeric handle for alphanumeric support. By default, the field is blank.<br><br>If SIP entity is of the Communication Manager type, Session Manager uses preferred handle in CM Endpoint profile. |
| <b>SIP URI</b>           | A unique alphanumeric communication address of the user to make and receive voice or video calls. The <b>SIP URI</b> address can be: <username-projectname>@<xyz.com>.                                                                                                                                                                                 |
| <b>Attendant</b>         | The option to enable the attendant feature on the endpoint. If you select this check box, you can administer the endpoint as an attendant.<br><br>When you select the 9641SIP template type from <b>Template</b> , the system enables the <b>Attendant</b> check box.                                                                                  |

Clear Callr-Info option settings of leave-ACW, next-call, and on-call-release. If the <b>callr-info</b> button is not assigned to the phone on the station form, <b>Enhanced Callr-Info display for 1-line phones</b> does not apply.</li> </ul> |
| <b>Delete Endpoint on Unassign of Endpoint from User or Delete User</b> | <p>The option to specify whether to delete the endpoint from the Communication Manager device when you remove the association between the endpoint and the user or delete the user.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Override Endpoint Name</b>                                           | <p>The option to override the following:</p> <ul style="list-style-type: none"> <li>• The endpoint name on Communication Manager with the value you configured on the Manage users page during synchronization.</li> </ul> <p>If you clear the check box, the system does not override the endpoint name on Communication Manager with the name you configured in System Manager during synchronization.</p> <ul style="list-style-type: none"> <li>• The localized display name on the Manage Users page in the <b>Localized Display Name</b> field of Communication Manager. If you clear the check box, the system does not override the localized display name in the <b>Localized Display Name</b> field.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Communication Profile tab - CS1000 Endpoint Profile**

| Name                                  | Description                                                                                                                                                                   |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                         | The CS 1000 system of the endpoint.                                                                                                                                           |
| <b>Target</b>                         | The system customer number for the Communication Server.                                                                                                                      |
| <b>Template</b>                       | The phone or endpoint template that you can choose for the user. The element manager maintains all templates.                                                                 |
| <b>Update</b>                         | The option to update the endpoint profile information for the user. When you click <b>Update</b> , the system takes displays the element manager cut through for the updates. |
| <b>Service Details</b>                | The service details, such as set type of endpoints that the system displays after phone creation.                                                                             |
| <b>Primary DN</b>                     | The primary directory number of the phone. You can enter only numeric values.                                                                                                 |
| <b>Include in Corporate Directory</b> | The option to add this profile to the CS 1000 corporate directory.                                                                                                            |

**Communication Profile tab — Messaging Profile****\* Note:**

The system displays the following fields only if you can configure a messaging profile for the user

| Name                                                         | Description                                                                                                                                                                                              |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                                                | The messaging system on which you add the subscriber.                                                                                                                                                    |
| <b>Template</b>                                              | The template, system-defined or user-defined, that you associate with the subscriber.                                                                                                                    |
| <b>Mailbox Number</b>                                        | The mailbox number of the subscriber.                                                                                                                                                                    |
| <b>Password</b>                                              | The password for logging on to the mailbox.                                                                                                                                                              |
| <b>Delete Subscriber on Unassign of Subscriber from User</b> | Provides the option to specify whether to delete the subscriber mailbox from the Messaging device or Communication System Management when you remove this messaging profile or when you delete the user. |

**Communication Profile tab: Avaya Messaging Profile**

| Name                     | Description                                            |
|--------------------------|--------------------------------------------------------|
| <b>Officelinx System</b> | The Avaya Messaging system to which you add a mailbox. |

*Table continues...*

| Name                                     | Description                                                                                                                                                                                                                                                           |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Refresh</b>                           | The option to get information about company, departments, and feature groups from Avaya Messaging and save locally on System Manager for future use.<br><br>You do not require to refresh for every user.                                                             |
| <b>Mailbox Number</b>                    | The mailbox number of the subscriber.                                                                                                                                                                                                                                 |
| <b>Numeric Password</b>                  | The numeric password that is used to log in to the Avaya Messaging system.                                                                                                                                                                                            |
| <b>Confirm Numeric Password</b>          | The numeric password that you retype to confirm.                                                                                                                                                                                                                      |
| <b>Application User Password</b>         | The password that is used to gain access to non-telephone applications, such as Web Client, iLink Pro, iLink Pro Mobile, and iLink Pro Desktop.                                                                                                                       |
| <b>Confirm Application User Password</b> | The password that you retype to confirm.                                                                                                                                                                                                                              |
| <b>Company</b>                           | The name of the company to which the user belongs.                                                                                                                                                                                                                    |
| <b>Department</b>                        | The department to which the user belongs.                                                                                                                                                                                                                             |
| <b>Feature Group</b>                     | The feature group name that determines the rules for the mailboxes associated with it.                                                                                                                                                                                |
| <b>Capability</b>                        | The type of functionality that the user contains. The values are: <ul style="list-style-type: none"> <li>• <b>Standard</b></li> <li>• <b>Fax</b></li> <li>• <b>Messaging</b></li> <li>• <b>Collaboration</b></li> <li>• <b>Messaging and Collaboration</b></li> </ul> |
| <b>Domain Account Name</b>               | The mailbox NT account name of the Avaya Messaging profile.                                                                                                                                                                                                           |
| <b>Synchronization User Name</b>         | The account name that is used to gain access to the email server, for example, Microsoft Exchange and Google Gmail.                                                                                                                                                   |

 **Note:**

Only one-way update is supported for Officelinx elements. If you make any change directly on Officelinx, it does not reflect on System Manager. If you edit the user from System Manager, it overrides the changes you made directly on Officelinx.

### Communication Profile tab — IP Office Endpoint Profile

Use this profile to assign a new or an existing user to a System Manager device in User Management.

While adding a user, if you choose to assign a CM endpoint profile and an IP Office endpoint profile to the user, then the system uses the IP Office endpoint profile as the survivability option for the CM endpoint profile. That is, the endpoint extension used in the CM endpoint profile is also used for creating an IP Office endpoint profile so that when Communication Manager is unavailable, the IP Office device can serve the extension.

 **Note:**

If a Communication Manager endpoint profile is present while adding or editing a user, the user administration functions in the centralized mode. If a Communication Manager endpoint profile is present, the user administration functions in the distributed mode.

Commit the Communication Manager endpoint profile and the Session Manager endpoint profile before you add an IP Office endpoint profile for a centralized user.

| Name/Button                                      | Description                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                                    | The list of IP Office device names from which you can select the IP Office device you associate with the user.                                                                                                                                                                                                 |
| <b>Template</b>                                  | The list of user templates from which you can select your preferred template to set the user configurations.                                                                                                                                                                                                   |
| <b>Use Existing Extension</b>                    | Select the check box to use an existing endpoint extension to associate with this profile. If you do not select this check box, the system uses the available extensions.                                                                                                                                      |
| <b>Extension</b>                                 | The extension of the endpoint you associate.<br><br>The field lists the endpoints, existing or available, based on option you selected in the <b>Use Existing Endpoints</b> check box.                                                                                                                         |
| <b>Endpoint Editor</b> button                    | Starts the IP Office application, where you can edit or view the details of the IP Office endpoint.<br><br>After you save the changes in IP Office manager, the system does not update the modified data on the device or database until you commit the changes on the User Profile   Edit   <User Name> page. |
| <b>Module-Port</b>                               | The module port combination list for IP Office analog extensions. You must select <b>Module-Port</b> for centralized users with Set Type as <b>Analog</b> .                                                                                                                                                    |
| <b>Set Type</b>                                  | The set type for the IP Office endpoint profile. By default, the <b>Set Type</b> field is disabled. If you select a template, the set type is auto populated.                                                                                                                                                  |
| <b>Delete Extension On User Delete</b> check box | Provides the option to delete the extension associated with the user while deleting the user. By default, this check box is clear. This option is available for communication profiles associated with <b>Analog</b> and <b>Digital</b> set types.                                                             |

## Communication Profile tab: Equinox Conferencing

| Name                         | Description                                  |
|------------------------------|----------------------------------------------|
| <b>Equinox User Password</b> | The Equinox user password.                   |
| <b>Virtual Room Number</b>   | The virtual room number of the Equinox user. |

## Communication Profile tab — Presence Profile

| Name                                       | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                              | <p>The Presence Services instance that is the home Presence Services server for the user. You must select an instance. As a home server, the Presence Services instance can perform the following for the communication profile:</p> <ul style="list-style-type: none"> <li>• Aggregate presence</li> <li>• Archive instant messages if the Instant Messages option is enabled</li> </ul>            |
| <b>SIP Entity</b>                          | <p>The option to route the SIP-based messages through Presence Services. This system selects the SIP entity only if you select a Presence Services instance in the <b>System</b> field. <b>SIP Entity</b> is read-only. If the system cannot identify a SIP entity, an appropriate error message is displayed in the field.</p>                                                                      |
| <b>IM Gateway SIP Entity</b>               | The Presence Services instance for the user.                                                                                                                                                                                                                                                                                                                                                         |
| <b>Publish Presence with AES Collector</b> | <p>The option that determines if Presence Services must publish presence with AES Collector. The options are:</p> <ul style="list-style-type: none"> <li>• <b>System Default</b></li> <li>• <b>Off</b></li> <li>• <b>On</b></li> </ul> <p>The default is <b>System Default</b>. You can change the default value. You do not require to configure AES Collector in the Presence Services server.</p> |

## Communication Profile tab: Conferencing Profile

| Name                                                         | Description                                                                                                                                                                                                                                          |
|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Auto-generated Code Length</b>                     | <p>The number of characters in PIN. The default is 6.</p> <p>The system displays this field if you select the <b>Auto Generate Participant and Moderator Security Code</b> check box.</p>                                                            |
| <b>Auto Generate Participant and Moderator Security Code</b> | <p>Select the check box if the system must generate the participant security code and moderator security code for this user.</p> <p>Clear the check box to assign a specific participant security code or moderator security code for this user.</p> |
| <b>Participant Security Code</b>                             | <p>The participant security code that you assign for this user.</p> <p>The system displays this field only when the <b>Auto Generate Participant and Moderator Security Code</b> check box is clear.</p>                                             |

*Table continues...*

| Name                           | Description                                                                                                                                                                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Moderator Security Code</b> | The moderator security code that you assign for this user.<br><br>The system displays this field if the <b>Auto Generate Participant and Moderator Security Code</b> check box is clear.                                                                       |
| <b>Location</b>                | The location of the user. This field is mandatory for non-SIP users without a Session Manager profile and optional for SIP users.<br><br>For SIP users, the system uses the location value from the <b>Home Location</b> field in the Session Manager profile. |
| <b>Template</b>                | The Conferencing template that you assign to this user.                                                                                                                                                                                                        |

| Button               | Description                                                                     |
|----------------------|---------------------------------------------------------------------------------|
| <b>Get Templates</b> | Displays the list of Conferencing templates, which you can assign to this user. |

### Communication Profile tab: Work Assignment Profile

| Name                   | Description          |
|------------------------|----------------------|
| <b>Account</b>         | The account name.    |
| <b>Account Address</b> | The account address. |
| <b>Source</b>          | The source name.     |
| <b>Source Address</b>  | The source address.  |

When you click **Resource Details**, **Account Details**, or **Source Details**, the system displays the Assignment Management page in Work Assignment.

| Button                  | Description                                                                                                                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Resource Details</b> | Displays the Assignment Management page where you can configure assignment targets for the user.<br><br>You can assign resource details to an agent only when the user has the Work Assignment profile assigned to the user. |
| <b>Account Details</b>  | Displays the text box where you can add or modify the account name and account address.<br><br>You can add attributes to the account only when the account is added to the agent.                                            |
| <b>Source Details</b>   | Displays the text box where you can add or modify the source name and source address.<br><br>You can add properties and attributes to the source only when the source already exists.                                        |

### Membership tab — Roles section

| Name        | Description           |
|-------------|-----------------------|
| <b>Name</b> | The name of the role. |

*Table continues...*

| Name        | Description                         |
|-------------|-------------------------------------|
| Description | A brief description about the role. |

### Membership tab — Group Membership section

| Name        | Description                                 |
|-------------|---------------------------------------------|
| Name        | The name of the group.                      |
| Type        | The group type based on the resources.      |
| Hierarchy   | The position of the group in the hierarchy. |
| Description | A brief description about the group.        |

### Contacts tab — Default Contact List section

| Name        | Description                              |
|-------------|------------------------------------------|
| Description | A brief description of the contact list. |

### Contacts tab — Associated Contacts section

| Name             | Description                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Name        | The last name of the contact.                                                                                                                                                 |
| First Name       | The first name of the contact.                                                                                                                                                |
| Scope            | The categorization of the contact based on whether the contact is a public or private contact.                                                                                |
| Speed Dial       | The value that specifies whether the speed dial is set for the contact.                                                                                                       |
| Speed Dial Entry | The reduced number that represents the speed dial number.                                                                                                                     |
| Presence Buddy   | The value that specifies whether you can monitor the presence information of the contact or not.<br><b>False</b> indicates that you cannot track the presence of the contact. |

| Button      | Description                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------|
| Filter menu | You can find the <b>Filter menu</b> icon next to the name of each column.<br><br>Filters the data based on the search criteria. |

### Contacts tab — Private Contacts section

Use this section to add new private contacts, modify and deletes existing contacts.

| Name       | Description                            |
|------------|----------------------------------------|
| Last Name  | The last name of the private contact.  |
| First Name | The first name of the private contact. |

*Table continues...*

| Name                   | Description                            |
|------------------------|----------------------------------------|
| <b>Display Name</b>    | Display name of the private contact.   |
| <b>Contact Address</b> | The address of the private contact.    |
| <b>Description</b>     | A brief description about the contact. |

| Button             | Description                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Filter menu</b> | You can find the <b>Filter menu</b> icon next to the name of each column.<br><br>Filters the data based on the search criteria. |

### Common buttons

| Button      | Description                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Edit</b> | Displays the User Profile   Edit   <User Name> page. Use the User Profile   Edit   <User Name> page to modify the details of the user account. |
| <b>Done</b> | Closes the User Profile   Edit   <User Name> page and returns to the User Management page.                                                     |

## User Profile | Duplicate | <User Name> field descriptions

### Organization

| Name           | Description                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tenant</b>  | The name of the tenant that you select.                                                                                                                                |
| <b>Level 1</b> | The name of the level 1 hierarchy of the tenant organization. For example, Site.<br><br>The tenant administrator provides the hierarchy on the Tenant Management page. |
| <b>Level 2</b> | The name of the level 2 hierarchy of the tenant organization. For example, Department.                                                                                 |
| <b>Level 3</b> | The name of the level 3 hierarchy of the tenant organization. For example, Team.                                                                                       |

### User Provisioning Rule

| Name                          | Description                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------|
| <b>User Provisioning Rule</b> | The name of the user provisioning rule.<br><br>You can provide only one user provisioning rule. |

#### **Note:**

When you use the user provisioning rule to create a user, the system populates the values of user attributes from the user provisioning rule.

**\* Note:**

You cannot edit the tenant. If you select a different level 1 for the tenant from the organization hierarchy, the **Level 2** and **Level 3** fields become blank. You can select new values for level 2 and level 3. If you select a different level 2 for the tenant from the organization hierarchy, the **Level 3** field becomes blank. You can select a new value for level 3.

| Name                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last Name</b>                      | The last name of the user. For example, Miller.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Last Name (Latin Translation)</b>  | <p>The user-preferred last name that the system must display on the endpoints. For example, Miller.</p> <p>Typically, the name is in the written or spoken language of the user.</p> <p><b>* Note:</b></p> <p>When you create a user, if the <b>Last Name (Latin Translation)</b> and <b>First Name (Latin Translation)</b> fields are:</p> <ul style="list-style-type: none"> <li>Blank, the system displays the last name and first name in the fields. The values change when the last and first names change.</li> <li>Filled, the values remain the same even after you change the values in the <b>Last Name</b> and <b>First Name</b> fields.</li> </ul> |
| <b>First Name</b>                     | The first name of the user. For example, John.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>First Name (Latin Translation)</b> | <p>The user-preferred first name that the system must display on the endpoints. For example, John.</p> <p>Typically, the name is in the written or spoken language of the user.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Middle Name</b>                    | The middle name of the user, if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>                    | A brief description of the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Login Name</b>                     | <p>The unique system login name given to the user. The login name takes the form of username@domain. You use the login name to create the primary handle of the user.</p> <p>The login name is not case-sensitive. For example, if you enter JMILLER@AVAYA.COM, the system converts the login name to lowercase, that is, jmiller@avaya.com. However, on the login page, you can enter the login name in uppercase or lowercase.</p> <p>You cannot edit the <b>Login Name</b> field for users with the login name admin.</p>                                                                                                                                    |
| <b>Email Address</b>                  | The email address of the user for receiving email notifications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

*Table continues...*

| Name                          | Description                                                                                                                                                                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Type</b>              | Authentication type defines how the system performs user's authentication. The options are: <ul style="list-style-type: none"> <li>• <b>Enterprise:</b> User's login is authenticated by the enterprise.</li> <li>• <b>Basic:</b> User's login is authenticated by an Avaya Authentication Service.</li> </ul> |
| <b>Password</b>               | Type your password for the duplicate profile.                                                                                                                                                                                                                                                                  |
| <b>Confirm Password</b>       | Retype your password for confirmation.                                                                                                                                                                                                                                                                         |
| <b>Localized Display Name</b> | The localized display name of a user. It is typically the localized full name.                                                                                                                                                                                                                                 |
| <b>Endpoint Display Name</b>  | The full text name of the user represented in ASCII. It supports displays that cannot handle localized text, for example, some endpoints.                                                                                                                                                                      |
| <b>Title</b>                  | The personal title for address a user. This is typically a social title and not the work title.                                                                                                                                                                                                                |
| <b>Language Preference</b>    | The user's preferred written or spoken language.                                                                                                                                                                                                                                                               |
| <b>Time Zone</b>              | The preferred time zone of the user.                                                                                                                                                                                                                                                                           |
| <b>Employee ID</b>            | The employee number for the user.                                                                                                                                                                                                                                                                              |
| <b>Department</b>             | The department which the user belongs to.                                                                                                                                                                                                                                                                      |
| <b>Company</b>                | The organization where the user works.                                                                                                                                                                                                                                                                         |

### Identity tab — Address section

| Name                | Description                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>check box</b>    | Use this check box to select the address.                                                                       |
| <b>Name</b>         | The unique label that identifies the address.                                                                   |

| <b>Edit</b>   | Saves the changes that you made to the communication address. |
| <b>Delete</b> | Deletes the selected communication address.                   |

The page displays the following fields when you click **New** and **Edit** in the Communication Address section.

| Name                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>                    | <p>The type of handle. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Avaya SIP</b>: Indicates that the handle supports Avaya SIP-based communication.</li> <li>• <b>Avaya E.164</b>: Indicates that the handle refers to an E.164 formatted address. E.164 numbers can have maximum 13 digits and are usually written with a + prefix.</li> <li>• <b>Microsoft SIP</b>: Indicates that the handle supports SIP-based communication.</li> <li>• <b>Microsoft Exchange</b>: Indicates that the handle is an email address and supports communication with Microsoft SMTP server.</li> <li>• <b>Lotus Notes</b>: Indicates that the handle is for Lotus Notes and domino calendar.</li> <li>• <b>IBM Sametime</b>: Indicates that the handle is for IBM Sametime. The address must be in the DN=IBMHandle format.</li> <li>• <b>Avaya Presence/IM</b>: Indicates that the handle is an address that is used for Extensible Messaging and Presence Protocol (XMPP)-based Internet Messaging (IM) services and XMPP or Session Initiation Protocol-based (SIP) Presence services.</li> </ul> <p> <b>Note:</b></p> <p>To create the Presence communication profile, you must select <b>Avaya Presence/IM</b> and provide the communication address.</p> <ul style="list-style-type: none"> <li>• <b>GoogleTalk</b>: Indicates that the handle supports XMPP-based communication with the Google Talk service.</li> <li>• <b>Other Email</b>: Indicates that the handle is an email address other than MS Exchange email addresses.</li> <li>• <b>Other SIP</b>: Indicates that the handle supports SIP-based communication other than the listed ones.</li> <li>• <b>Other XMPP</b>: Indicates that the handle supports XMPP-based communication other than the listed ones.</li> <li>• <b>Work Assignment</b>: Indicates that the handle supports accounts that can be assigned to an agent for Work Assignment.</li> </ul> |
| <b>Fully Qualified Address</b> | <p>The fully qualified domain name or uniform resource identifier. The address can be an email address, IM user, or an address of a communication device by using which the user can send or receive messages. You must provide the fully qualified address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Button        | Description                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------|
| <b>Add</b>    | Saves the new communication address or modified communication address information in the database. |
| <b>Cancel</b> | Cancels the addition of communication address.                                                     |

### Communication Profile tab — Session Manager

**\* Note:**

The system displays the following fields only if a communication profile of the user exists for the product:

| Name                                    | Description                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Primary Session Manager</b>          | Select the Session Manager instance that should be used as the home server for the currently displayed Communication Profile. As a home server, the selected primary Session Manager instance will be used as the default access point for connecting devices associated with the Communication Profile to the Aura network. A selection is required. |
| <b>Secondary Session Manager</b>        | The secondary Session Manager instance that provides continued service to SIP devices associated with this Communication Profile when the primary Session Manager is unavailable. A selection is optional.                                                                                                                                            |
| <b>Origination Application Sequence</b> | <p>An Application Sequence that will be invoked when calls are routed from this user. A selection is optional.</p> <p><b>* Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p>    |
| <b>Termination Application Sequence</b> | <p>An Application Sequence that will be invoked when calls are routed to this user. A selection is optional.</p> <p><b>* Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p>      |
| <b>Conference Factory Set</b>           | <p>The conference factory set to enable media capability-based call routing to the Conferencing SIP entities.</p> <p>Use the <b>Session Manager &gt; Application Configuration &gt; Conference Factories</b> webpage to administer the Conference Factory Sets.</p>                                                                                   |

*Table continues...*

| Name                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Survivability Server</b> | <p>For local survivability, a Survivability Server can be specified to provide survivability communication services for devices associated with a Communication Profile in the event that local connectivity to Session Manager instances in the Aura is lost. If a Branch Session Manager is selected, and the termination and origination application sequences contain a Communication Manager application, sequencing to this application continues, locally, to the Communication Manager survivable remote server resident with the Branch Session Manager. A selection is optional.</p> <p> <b>Note:</b></p> <p>If a termination or origination application sequence contains a Communication Manager application, Communication Manager associated with the application must be the main Communication Manager server for the Communication Manager survivable remote server that is resident with the Branch Session Manager.</p> |
| <b>Home Location</b>        | A Home Location to support mobility for the currently displayed user. Session Manager uses the home location when the IP address of the calling phone does not match any IP Address Pattern of any of the location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Communication Profile tab: Avaya Breeze® platform Profile

| Name                   | Description                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Service Profile</b> | The profile that you assign to the user. The user can gain access to the service contained in the profile. |

### Communication Profile tab — CM Endpoint Profile

 **Note:**

The system displays these fields only if a Communication Manager Endpoint profile exists for the user.

| Name/Button                   | Description                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                 | The Communication Manager system on which you add the endpoint. You must select the system.                                                                                                                                                             |
| <b>Use Existing Endpoints</b> | The existing endpoint extension to associate with this profile. If you do not select this check box, the system uses the available extensions.                                                                                                          |
| <b>Extension</b>              | <p>The extension of the endpoint that you associate this profile with. You must select the extension.</p> <p>The field lists the endpoints, existing or available, based on the option you selected in the <b>Use Existing Endpoints</b> check box.</p> |
| <b>Template</b>               | The template, system defined or user defined, that you associate with the endpoint. Select the template based on the set type you add.                                                                                                                  |

*Table continues...*

| Name/Button                                              | Description                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Set Type</b>                                          | The set type of the endpoint you associate with. When you select a template, the system populates the corresponding set types.                                                                                                                                                                                                                     |
| <b>Security Code</b>                                     | The security code for authorized access to the endpoint.                                                                                                                                                                                                                                                                                           |
| <b>Port</b>                                              | The relevant port for the set type you select. You must select the port.<br>The field lists the possible ports based on the selected set type.                                                                                                                                                                                                     |
| <b>Voice Mail Number</b>                                 | The voice mail number of the endpoint you associate with.<br><br> <b>Note:</b><br>You must clear Local Device Services Data on all Avaya Aura® Web Gateway nodes if you change the value of <b>Voice Mail Number</b> .                                            |
| <b>Preferred Handle</b>                                  | Numeric only handles, SIP handles, or nonSIP handles, that are administered for a user.<br><br>The <b>Preferred Handle</b> field is optional. Select numeric handle for alphanumeric support. By default, the field is blank.<br><br>If SIP entity is of Communication Manager type, Session Manager uses preferred handle in CM Endpoint profile. |
| <b>SIP URI</b>                                           | A unique alphanumeric communication address of the user to make and receive voice or video calls. The <b>SIP URI</b> address can be: <username-projectname>@<xyz.com>.                                                                                                                                                                             |
| <b>Calculate Route Pattern</b>                           | The option to automatically select the route pattern based on the primary or secondary Session Manager configured in the <b>Session Manager Communication Profile</b> .                                                                                                                                                                            |
| <b>Sip Trunk</b>                                         | The system makes this field available only for the SIP set type.<br>If you select <b>Calculate Route Pattern</b> check box, the system: <ul style="list-style-type: none"> <li>• Populates the <b>Sip Trunk</b> field</li> <li>• Makes <b>Sip Trunk</b> field read-only.</li> </ul>                                                                |
| <b>Attendant</b>                                         | The option to enable the attendant feature on the endpoint. If you select this check box, you can administer the endpoint as an attendant.<br><br>When you select the 9641SIP template type from <b>Template</b> , the system enables the <b>Attendant</b> check box.                                                                              |
| <b>Delete Endpoint on Unassign of Endpoint from User</b> | The option to specify whether to delete the endpoint from the Communication Manager device when you remove the association between the endpoint and the user or delete the user.                                                                                                                                                                   |

*Table continues...*

| Name/Button                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Override Endpoint Name</b>                         | <p>Use this check box for the following two purposes:</p> <ul style="list-style-type: none"> <li>To override the endpoint name on Communication Manager with the value you configured on the Manage Users page during synchronization.</li> </ul> <p>If you clear the check box, the system does not override the endpoint name on Communication Manager with the name you configured in System Manager during synchronization.</p> <ul style="list-style-type: none"> <li>To override the Localized Display Name on the Manager Users page on the <b>Localized Display Name</b> field of Communication Manager.</li> </ul> <p>If you clear the check box, the system does not override the Localized display name in the <b>Localized Display Name</b> field.</p> |
| <b>Allow H.323 and SIP Endpoint Dual Registration</b> | <p>The option to register an H.323 endpoint and a SIP endpoint together at the same time to the same extension. For more information about the SIP and H.323 dual registration feature, see <i>Avaya Aura® Communication Manager Feature Description and Implementation</i> on the Avaya Support website at <a href="http://support.avaya.com">http://support.avaya.com</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                   |

### Communication Profile tab - CS1000 Endpoint Profile

| Name                                  | Description                                                                                                                                                  |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                         | The CS1000 system to which you want to add a phone.                                                                                                          |
| <b>Target</b>                         | The system customer number for the Communication Server.                                                                                                     |
| <b>Template</b>                       | The phone or endpoint template that you can choose for the user. Select a template from the drop down list. The element manager maintains all the templates. |
| <b>Update</b>                         | Updates the station profile information for the user. When you click this button, the system takes you to the element manager cut through for the updates.   |
| <b>Service Details</b>                | Displays service details of endpoints, such as set type, after phone creation.                                                                               |
| <b>Primary DN</b>                     | The primary directory number of the phone. You can enter only numeric values for this field.                                                                 |
| <b>Include in Corporate Directory</b> | Use to add this profile to the CS1K Corporate Directory feature.                                                                                             |

### Communication Profile tab — Messaging Profile

 **Note:**

You may see these fields only if a messaging profile can be configured for the user.

| Name          | Description                                                   |
|---------------|---------------------------------------------------------------|
| <b>System</b> | The Messaging System on which you need to add the subscriber. |

*Table continues...*

| Name                                                         | Description                                                                                                                                                                                       |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Template</b>                                              | The template (system defined and user defined) you want to associate with the subscriber.                                                                                                         |
| <b>Use Existing Subscriber on System</b>                     | Use this check box to specify whether to use an existing subscriber mailbox number to associate with this profile.                                                                                |
| <b>Mailbox Number</b>                                        | The mailbox number of the subscriber.<br><br>The field lists the existing subscriber if you select the <b>Use Existing Subscriber on System</b> check box.                                        |
| <b>Password</b>                                              | The password for logging into the mailbox.                                                                                                                                                        |
| <b>Delete Subscriber on Unassign of Subscriber from User</b> | Use to specify whether you want to delete the subscriber mailbox from the Messaging Device or Communication System Management when you remove this messaging profile or when you delete the user. |

### Communication Profile tab: Avaya Messaging Profile

| Name                                     | Description                                                                                                                                                                                                                                                           |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Officelinx System</b>                 | The Avaya Messaging system to which you add a mailbox.                                                                                                                                                                                                                |
| <b>Refresh</b>                           | The option to get information about company, departments, and feature groups from Avaya Messaging and save locally on System Manager for future use.<br><br>You do not require to refresh for every user.                                                             |
| <b>Mailbox Number</b>                    | The mailbox number of the subscriber.                                                                                                                                                                                                                                 |
| <b>Numeric Password</b>                  | The numeric password that is used to log in to the Avaya Messaging system.                                                                                                                                                                                            |
| <b>Confirm Numeric Password</b>          | The numeric password that you retype to confirm.                                                                                                                                                                                                                      |
| <b>Application User Password</b>         | The password that is used to gain access to non-telephone applications, such as Web Client, iLink Pro, iLink Pro Mobile, and iLink Pro Desktop.                                                                                                                       |
| <b>Confirm Application User Password</b> | The password that you retype to confirm.                                                                                                                                                                                                                              |
| <b>Company</b>                           | The name of the company to which the user belongs.                                                                                                                                                                                                                    |
| <b>Department</b>                        | The department to which the user belongs.                                                                                                                                                                                                                             |
| <b>Feature Group</b>                     | The feature group name that determines the rules for the mailboxes associated with it.                                                                                                                                                                                |
| <b>Capability</b>                        | The type of functionality that the user contains. The values are: <ul style="list-style-type: none"> <li>• <b>Standard</b></li> <li>• <b>Fax</b></li> <li>• <b>Messaging</b></li> <li>• <b>Collaboration</b></li> <li>• <b>Messaging and Collaboration</b></li> </ul> |
| <b>Domain Account Name</b>               | The mailbox NT account name of the Avaya Messaging profile.                                                                                                                                                                                                           |

*Table continues...*

| Name                             | Description                                                                                                         |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Synchronization User Name</b> | The account name that is used to gain access to the email server, for example, Microsoft Exchange and Google Gmail. |

**\* Note:**

Only one-way update is supported for Officelinx elements. If you make any change directly on Officelinx, it does not reflect on System Manager. If you edit the user from System Manager, it overrides the changes you made directly on Officelinx.

### Communication Profile tab — IP Office Endpoint Profile

Use this profile to assign a new or an existing user to a System Manager device in User Management.

While adding a user, if you choose to assign a CM endpoint profile and an IP Office endpoint profile to the user, then the system uses the IP Office endpoint profile as the survivability option for the CM endpoint profile. That is, the endpoint extension used in the CM endpoint profile is also used for creating an IP Office endpoint profile so that when Communication Manager is unavailable, the IP Office device can serve the extension.

**\* Note:**

If a Communication Manager endpoint profile is present while adding or editing a user, the user administration functions in the centralized mode. If a Communication Manager endpoint profile is present, the user administration functions in the distributed mode.

Commit the Communication Manager endpoint profile and the Session Manager endpoint profile before you add an IP Office endpoint profile for a centralized user.

| Name/Button                   | Description                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                 | Displays a list of IP Office device names from which you can select the IP Office device you want to associate with the user.                                                                                                                                                                        |
| <b>Template</b>               | Displays a list of user templates from which you can select your preferred template to set the user configurations.                                                                                                                                                                                  |
| <b>Use Existing Extension</b> | Select the check box to use an existing endpoint extension to associate with this profile. If you do not select this check box, the system uses the available extensions.                                                                                                                            |
| <b>Extension</b>              | The extension of the endpoint you want to associate.<br><br>The field lists the endpoints, existing or available, based on option you selected in the <b>Use Existing Endpoints</b> check box.                                                                                                       |
| <b>Endpoint Editor</b> button | Launches the IP Office application, where you can edit or view details of the IP Office endpoint.<br><br>After you save the changes in IP Office, the system does not update the modified data on the device or database until you commit the changes on the User Profile   Edit   <User Name> page. |
| <b>Module-Port</b>            | The module port combination list for IP Office analog extensions. You must select <b>Module-Port</b> for centralized users with Set Type as <b>Analog</b> .                                                                                                                                          |

*Table continues...*

| Name/Button                                      | Description                                                                                                                                                                                                                                        |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Set Type</b>                                  | Displays the set type for the IP Office endpoint profile. By default, the <b>Set Type</b> field is disabled. If you select a template, the set type is auto populated.                                                                             |
| <b>Delete Extension On User Delete</b> check box | Provides the option to delete the extension associated with the user while deleting the user. By default, this check box is clear. This option is available for communication profiles associated with <b>Analog</b> and <b>Digital</b> set types. |

### Communication Profile tab: Equinox Conferencing

| Name                         | Description                                  |
|------------------------------|----------------------------------------------|
| <b>Equinox User Password</b> | The Equinox user password.                   |
| <b>Virtual Room Number</b>   | The virtual room number of the Equinox user. |

### Communication Profile tab — Presence Profile

| Name                                       | Description                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                              | The Presence Services instance that is the home Presence Services server for the user. You must select an instance. As a home server, the Presence Services instance can perform the following for the communication profile: <ul style="list-style-type: none"> <li>• Aggregate presence</li> <li>• Archive instant messages if the Instant Messages option is enabled</li> </ul>      |
| <b>SIP Entity</b>                          | The option to route the SIP-based messages through Presence Services. This system selects the SIP entity only if you select a Presence Services instance in the <b>System</b> field. <b>SIP Entity</b> is read-only. If the system cannot identify a SIP entity, an appropriate error message is displayed in the field.                                                                |
| <b>IM Gateway SIP Entity</b>               | The Presence Services instance for the user.                                                                                                                                                                                                                                                                                                                                            |
| <b>Publish Presence with AES Collector</b> | The option that determines if Presence Services must publish presence with AES Collector. The options are: <ul style="list-style-type: none"> <li>• <b>System Default</b></li> <li>• <b>Off</b></li> <li>• <b>On</b></li> </ul> The default is <b>System Default</b> . You can change the default value. You do not require to configure AES Collector in the Presence Services server. |

## Communication Profile tab: Conferencing Profile

| Name                                                         | Description                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Auto-generated Code Length</b>                     | The number of characters in PIN. The default is 6.<br><br>The system displays this field if you select the <b>Auto Generate Participant and Moderator Security Code</b> check box.                                                                             |
| <b>Auto Generate Participant and Moderator Security Code</b> | Select the check box if the system must generate the participant security code and moderator security code for this user.<br><br>Clear the check box to assign a specific participant security code or moderator security code for this user.                  |
| <b>Participant Security Code</b>                             | The participant security code that you assign for this user.<br><br>The system displays this field only when the <b>Auto Generate Participant and Moderator Security Code</b> check box is clear.                                                              |
| <b>Moderator Security Code</b>                               | The moderator security code that you assign for this user.<br><br>The system displays this field if the <b>Auto Generate Participant and Moderator Security Code</b> check box is clear.                                                                       |
| <b>Location</b>                                              | The location of the user. This field is mandatory for non-SIP users without a Session Manager profile and optional for SIP users.<br><br>For SIP users, the system uses the location value from the <b>Home Location</b> field in the Session Manager profile. |
| <b>Template</b>                                              | The Conferencing template that you assign to this user.                                                                                                                                                                                                        |

| Button               | Description                                                                     |
|----------------------|---------------------------------------------------------------------------------|
| <b>Get Templates</b> | Displays the list of Conferencing templates, which you can assign to this user. |

## Communication Profile tab: Work Assignment Profile

| Name                   | Description          |
|------------------------|----------------------|
| <b>Account</b>         | The account name.    |
| <b>Account Address</b> | The account address. |
| <b>Source</b>          | The source name.     |
| <b>Source Address</b>  | The source address.  |

When you click **Resource Details**, **Account Details**, or **Source Details**, the system displays the Assignment Management page in Work Assignment.

| Button                  | Description                                                                                                                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Resource Details</b> | Displays the Assignment Management page where you can configure assignment targets for the user.<br><br>You can assign resource details to an agent only when the user has the Work Assignment profile assigned to the user. |

| Show Regular users | Returns to the User page and displays the active users. |

## User Restore Confirmation field descriptions

Use this page to restore a deleted user.

| Name                          | Description                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last Name</b>              | The last name of the user.                                                                                                                                                                                                                                                                                                                                |
| <b>First Name</b>             | The first name of the user.                                                                                                                                                                                                                                                                                                                               |
| <b>Display Name</b>           | The localized display name of the user.                                                                                                                                                                                                                                                                                                                   |
| <b>Login Name</b>             | The unique name of the user account.                                                                                                                                                                                                                                                                                                                      |
| <b>Organization Hierarchy</b> | <p>The hierarchy of the tenant organization in the format Tenant/Site/Department/Team.</p> <p>For example, Citi/Pune/HomeLoans/LoanSupport.</p> <p> <b>Note:</b></p> <p>The system displays the field only when the administrator enables the Multi Tenancy feature.</p> |
| <b>Last login</b>             | The date and time when the user last logged on to the system.                                                                                                                                                                                                                                                                                             |

| Button         | Description                                                                               |
|----------------|-------------------------------------------------------------------------------------------|
| <b>Restore</b> | Removes the user from the list of deleted users and restores the user as an active user.  |
| <b>Cancel</b>  | Closes the User Restore Confirmation page and returns you back to the Deleted Users page. |

## Assign Users To Roles field descriptions

Use this page to assign one or more users to the selected roles. This page has the following two sections:

- Selected Roles
- Select Users

### Selected Roles section

The roles to which you can assign users.

| Name                 | Description                                                         |
|----------------------|---------------------------------------------------------------------|
| <b>Name</b>          | Displays the name of the role.                                      |
| <b>Resource Type</b> | Displays the resource type that the corresponding role is assigned. |
| <b>Description</b>   | Displays a brief description about role.                            |

### Select Users section

The table displays the users to which you can assign the roles.

| Name                    | Description                                                            |
|-------------------------|------------------------------------------------------------------------|
| <b>Select check box</b> | Provides the option to select the user.                                |
| <b>Last Name</b>        | Displays the last name of the user.                                    |
| <b>First Name</b>       | Displays the first name of the user.                                   |
| <b>Display Name</b>     | The display name of the user.                                          |
| <b>User Name</b>        | Displays the unique name that identifies the user.                     |
| <b>Last Login</b>       | Displays the time and date when the user last logged on to the system. |

| Button        | Description                                                              |
|---------------|--------------------------------------------------------------------------|
| <b>Commit</b> | Assigns user to the role.                                                |
| <b>Cancel</b> | Cancels the assign users operation and returns to the Manage Roles page. |

## UnAssign Roles field descriptions

### Selected Roles

The role from which users are unassigned.

| Name                 | Description                                  |
|----------------------|----------------------------------------------|
| <b>Name</b>          | The name of the role.                        |
| <b>Resource Type</b> | The resource type that the role is assigned. |
| <b>Description</b>   | A brief description of the role.             |

### Select Users

The table displays the users for which you can remove the roles.

| Name                    | Description                                                   |
|-------------------------|---------------------------------------------------------------|
| <b>Select check box</b> | The option to select the user.                                |
| <b>Last Name</b>        | The last name of the user.                                    |
| <b>First Name</b>       | The first name of the user.                                   |
| <b>Display Name</b>     | The display name of the user.                                 |
| <b>User Name</b>        | The unique name that identifies the user.                     |
| <b>Last Login</b>       | The time and date when the user last logged on to the system. |

| Button        | Description                                                              |
|---------------|--------------------------------------------------------------------------|
| <b>Commit</b> | Unassigns the role from the users.                                       |
| <b>Cancel</b> | Cancels the assign users operation and returns to the Manage Roles page. |

---

## Managing bulk import and export

### Bulk import and export

In System Manager, you can import and export user profiles and global settings in bulk. To import data in bulk, you must provide an XML file or an Excel file as input file. System Manager validates any file that you upload during the bulk import operation.

System Manager filters uploaded files based on the file extension and mime type or bytes in the file.

The system exports the data to an XML file and an Excel file. The System Manager database stores the imported user profiles and global settings data.

You can import and export the following user attributes in bulk:

- Identity data
- Communication profile set
- Handles
- Communication profiles

The supported communication profiles are CM Endpoint, CM Agent, Messaging, Session Manager, CS 1000 Endpoint, Conferencing, IP Office, Presence, Avaya Breeze® platform, Work Assignment, Avaya Messaging, and Avaya Meetings Server.

You can import and export the following global settings attributes in bulk:

- Public Contact Lists
- Shared Addresses
- Default access control list (ACLs)

#### Important:

System Manager does not support import and export of roles in bulk.

### Bulk import and export using the Excel file

In System Manager, you can import and export user profiles in bulk by using an Excel file and an XML file. To import data in bulk, provide an XML file or an Excel file as input that System Manager supports. When you export the data from the System Manager web console, the system exports the data to an XML file and an Excel file that System Manager supports.

Microsoft Office Excel 2007 and later support bulk import and export in the .xlsx format. You can download the Excel file from the User Management page.

Importing and exporting in bulk by using the Excel template provides the following features:

- Supports the following types of user information:
  - Basic. The identity attributes of the user that include user provisioning rule name for the user, the tenant, and organization hierarchy details
  - Profile Set. Entries for all communication profile sets for all users

The Profile Set sheet contains an entry for each communication profile set for a user. The user must set only one communication profile set as *true* for a user in the **Is Default** column. The value *true* indicates that the communication profile set of the user is the default.

- Handle. The communication address of the user
- Session Manager profile
- Avaya Breeze® platform profile
- CM Endpoint profile with all attributes of the station communication profile
- CM Agent profile with all attributes.
- Messaging profile
- Avaya Messaging profile
- IP Office Endpoint profile
- CS 1000 Endpoint profile
- Presence profile
- Conferencing profile
- Work Assignment profile
- Avaya Meetings Server profile
- Supports more than one communication profile set.
- Supports the creation, updation, and deletion of the user by using the same Excel file. However, you can only perform one operation at a time.
- For updation, supports only the partial merge operation.

Bulk import and export by using Excel does not support complete or partial replace of the user for imports in bulk.

Bulk import and export by using Excel supports a subset of user attributes that XML supports. For example, Excel does not support user contacts, address, and roles.

## The Excel file

The sample Excel file contains the sample data of some key attributes of the user. The Excel file provides a description of header fields. When you download the Excel template from the User Management page, the values remain blank. To use the Excel file, export some users for reference in an Excel file.

The login name in the **Basic** worksheet is the key attribute that you use to link the user records in other worksheets.

The login name of the user and the profile set name in the **Profile Set** worksheet are used to link to the user records in other worksheets for that user profile.

- Although you can edit the header fields in the Excel template, do not change any details of any headers in the worksheets. The import or export might fail if you change the details of the header.
- Do not change the column position in the Excel file or the structure of the Excel template.

- Do not sort the data in worksheets.

## CM Endpoint communication profile

The Excel file contains all attributes for the CM station endpoint profile that are spread in different worksheets. The parent sheet provides a link to the same user profile record in the child worksheet. The link points to the first record in the child sheet if the user profile contains multiple records in the child worksheet.

## Examples of bulk import and export of user by using the Excel file

The following are the credentials of John Miller, a user with two communication profile sets:

- Login name: johnmiller@avaya.com
- Name of the default communication profile set: Primary
- Name of the nondefault communication profile set: secondaryProfile

### Example of navigation across Excel worksheets

In the exported file, you can use the hyperlink to navigate across worksheets to access various records for a profile data of a user.

In the **CM Endpoint Profile** worksheet, the **Station Site Data** and **Buttons** columns contain hyperlinks to navigate to the respective worksheets. If the child worksheet, for example, **Buttons** contains only one record in the worksheet for that user profile, the link points to the corresponding record of the user profile. If the child worksheet contains multiple records for that user profile, the link points to the first record in the list.

| Login Name*                  | ..... | Station Site Data                                 | Abbr List | Buttons                                 |
|------------------------------|-------|---------------------------------------------------|-----------|-----------------------------------------|
| johnmiller@avaya.com#Primary | ..... | <a href="#">Go to Station Site Data worksheet</a> |           | <a href="#">Go to Buttons worksheet</a> |

In the following **Station Site Data** worksheet, the link points to the corresponding user profile record of the child worksheet because this child worksheet contains only one record for that user profile.

| Login Name*                  | Room | Jack | Cable | Floor | Building | Headset | Speaker | Mounting | Cord Length | Set Color |  |
|------------------------------|------|------|-------|-------|----------|---------|---------|----------|-------------|-----------|--|
| johnmiller@avaya.com#Primary |      |      |       |       |          | false   | false   | d        | 0           |           |  |

The following **Buttons** worksheet contains multiple records for johnmiller@avaya.com#Primary, the user profile, but the link points to the first record in the list.

| Login Name*                  | Number* | Type*     | Data1 | Data2 | Data3 | Data4 | Data5 | Data6 |
|------------------------------|---------|-----------|-------|-------|-------|-------|-------|-------|
| johnmiller@avaya.com#Primary | 1       | call-appr |       |       |       |       |       |       |
| johnmiller@avaya.com#Primary | 2       | call-appr |       |       |       |       |       |       |
| johnmiller@avaya.com#Primary | 3       | call-appr |       |       |       |       |       |       |

### Example of handling multiple communication profile sets for a user

In the exported Excel file, the system appends the login name with #profileSetName in all worksheets except the **Basic** and **Profile Set** worksheets. Appending the profile set name to the login name associates the communication profile set with the user record, for example, jmiller@avaya.com#profileSetName. When you export users in the Excel file, the association is automatic. When you provide data in a blank Excel template that you downloaded for import, you must make the association manually.

#### \* Note:

The **Profile Set** worksheet must contain all communication profile sets of a user, but only one communication profile set can be the default. The **Is Default** column is set to `true` only for the default profile.

In the **Profile Set** worksheet, the two communication profile sets for the user John Miller must contain the following information:

| Login Name*          | Name*            | Is Default* |
|----------------------|------------------|-------------|
| johnmiller@avaya.com | secondaryProfile | false       |
| johnmiller@avaya.com | Primary          | true        |

If a SIP e164 handle is associated with secondaryProfile of John Miller, the **Handle** worksheet must contain the following information:

| Login Name*                           | Handle* | Type* | Sub Type | Domain            |
|---------------------------------------|---------|-------|----------|-------------------|
| johnmiller@avaya.com#secondaryProfile | +1123   | sip   | e164     | smgrdev.avaya.com |

If a Session Manager communication profile is associated with secondaryProfile of John Miller, the **Session Manager Profile** worksheet must contain the following information:

| Login Name*                           | Type*           | Session Manager | Session Manager | Termination Application Sequence | Origination Application Sequence | Conference Factory Set | Survivability Server | Home Location* | Max. Simultaneous Devices | Block New Registration When Max Active | Enable Disable Call Log |
|---------------------------------------|-----------------|-----------------|-----------------|----------------------------------|----------------------------------|------------------------|----------------------|----------------|---------------------------|----------------------------------------|-------------------------|
| johnmiller@avaya.com#secondaryProfile | Session Manager | sm6             |                 |                                  |                                  |                        |                      | Pune           | 6                         | false                                  | true                    |

If a Avaya Breeze® platform communication profile is associated with Primary for John Miller, the **CE Profile** worksheet must contain the following:

| Login Name*                  | Type* | Service Profile* |
|------------------------------|-------|------------------|
| johnmiller@avaya.com#Primary | AUS   | TempProfile      |

## Hierarchy in communication profile worksheets

The table provides the parent-child relation of communication profile worksheets in the Excel template for bulk import and export of user.

| Element                          | Master worksheet        | Child worksheets                                                                                                                                                                                                                                                                                                                         |
|----------------------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Session Manager                  | Session Manager Profile | None                                                                                                                                                                                                                                                                                                                                     |
| Communication Manager — Endpoint | CM Endpoint Profile     | <ul style="list-style-type: none"> <li>• Station Site Data</li> <li>• Buttons</li> <li>• Feature Buttons</li> <li>• Expansion Module Buttons</li> <li>• Soft Keys</li> <li>• Display Buttons</li> <li>• Station Abbr Dialing Data</li> <li>• Station Data Module</li> <li>• Station Hot Line Data</li> <li>• Native Name Data</li> </ul> |
| Communication Manager — Agent    | CM Agent Profile        | <ul style="list-style-type: none"> <li>• CM Agent LoginId Skills Data</li> <li>• CM Agent Native Name Data</li> </ul>                                                                                                                                                                                                                    |

*Table continues...*

| Element                | Master worksheet           | Child worksheets                                                                                                                           |
|------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Messaging              | Messaging Profile          | <ul style="list-style-type: none"> <li>• Messaging MMSpecific</li> <li>• Messaging CMMSpecific</li> <li>• Messaging AAMSpecific</li> </ul> |
| Conferencing           | Conferencing Profile       | None                                                                                                                                       |
| IP Office              | IP Office Endpoint Profile | None                                                                                                                                       |
| CS 1000                | CS 1000 Endpoint Profile   | None                                                                                                                                       |
| Avaya Breeze® platform | CE Profile                 | None                                                                                                                                       |
| Presence               | Presence Profile           | None                                                                                                                                       |
| Work Assignment        | Work Assignment Profile    | <ul style="list-style-type: none"> <li>• Work Assignmnt Resource Details</li> <li>• Work Assignmnt Agent Attributes</li> </ul>             |
| Avaya Messaging        | Avaya Messaging Profile    | None                                                                                                                                       |
| Equinox                | Equinox Profile            | None                                                                                                                                       |

## Microsoft Excel data link error

Microsoft Excel 2010 displays a data link error.

### Related links

[Proposed solution](#) on page 375

## Proposed solution

### About this task

You can ignore Data link error that Microsoft Excel 2010 displays. However, perform the following procedure to avoid this error the next time you open an Excel file.

### Procedure

1. On the Excel worksheet, close the warning message.
2. On the **Data** menu, click **Edit Links**.
3. On the Edit Links dialog box, click **Startup Prompt**.
4. Click **Don't display the alert and don't update automatic links** and click **OK**.

5. Click **Close**.
6. Save the Excel file.
7. Close the Excel file and open the file again.

The system does not display the data link error message now.

## Data entry warning in Microsoft Excel

The data type of the cell in Excel is text. If you provide a number in the cell, Excel displays the `Number Stored as Text` message. Ignore the warning and do not change the data type of the cell.

#### Related links

[Proposed solution](#) on page 376

## Proposed solution

### About this task

You can ignore data entry warning that Microsoft Excel 2007 or later displays. However, perform this procedure to turn off the warning message.

### Procedure

1. Based on the version, do one of the following:
  - In Microsoft Office Excel 2007, click **Excel Options**.
  - In Microsoft Office Excel 2010, click **File > Options > Excel Options**.For other Microsoft Office Excel versions, use the appropriate options.
2. In Microsoft Office Excel 2010, in the left navigation pane, click **Formulas** and clear the **Numbers formatted as text or preceded by an apostrophe** check box.
3. Click **OK**.

## Key features of bulk import and bulk export

- Supports import of user profiles from an XML file and Excel file, and import of global settings from an XML file. Also, supports the export of data to an XML file and Excel file.
- Supports the following error configurations:
  - Abort on first error. Stops the import of user records when the import user operation encounters the first error in the import file containing the user records.
  - Continue processing other records. Imports the next user record even if the import user operation encounters an error while importing a user record.
- Supports the following import types:
  - A *Partial Import* type helps import of users with specific user attributes.

- A *Complete Import* helps import of users with all user attributes.
- Provides various configuration options if a record that you must import matches an existing record in the database. You can configure to skip, replace, merge, or delete a matching record that already exists and reimport data.
- Supports scheduling of bulk import jobs from System Manager Web Console.
- Displays import job details, such as job scheduled time, job end time, job status, job completion status in percentage, number of user records in the input file, number of user records in the input file with warnings, and number of user records in the input file that failed to import. Also, provides the link to the Scheduler user interface.
- Supports cancellation and deletion of an import job.
- Maintains logs of records that fail to import and that require manual intervention.
- Supports download of failed records in an XML file. The XML file conforms to XML schema definition. You can modify the failed records and reimport the records into the database.

## About bulk import of users

You can use the bulk import functionality to import users in bulk with their attributes from an XML file. The XML file must conform to XML schema definition. For more information, see [XML Schema Definition for bulk import of users](#) on page 408. See [Sample XML for bulk import of users with all attributes](#) on page 415 for the sample XML file for bulk import of user.

You can perform the following tasks with the bulk import functionality:

- Abort or continue the import process when the import user operation encounters first error in the user input file.
- Perform the following import types:
  - A *Partial* import type helps import of users with specific user attributes.
  - A *Complete* import type helps import of users with all user attributes.
- Skip import of the users that already exist in the database. Use this option to import new users from the XML file.
- Replace the users in the database with the new users from the file you imported. The system performs the following actions:
  - Replaces all items of user collection attributes such as CommprofileSet and Contactlist.
  - Removes the existing items.
  - Adds the new items from the XML.
  - Updates the single-value user attributes.

For example, the user John Miller has StationA and EndpointB as existing commprofiles in default commprofilesset and you import an XML file containing users with StationC and EndpointB with *Replace* option. After you import, John Miller has commprofiles StationC and EndpointB in the default commprofilesset.

 **Note:**

For CS1000 Endpoint Profile, you cannot import both communication profile and user at the same time. You must add the user and then merge the profile.

- Update and merge the user attributes data from the imported file to the existing data. The system performs the following actions:
  - Merges items of user collection attributes such as CommprofileSet and Contactlist.
  - Retains and updates the existing items.
  - Adds the new items from the XML.
  - Updates the single-value user attributes.

For example, the user John Miller has StationA and EndpointB as existing commprofiles in default commprofilesset and you import an XML file containing users with StationC and EndpointB with *Replace* option. After you import, John Miller has commProfiles StationA, StationC, EndpointB in the default commprofilesset.

- Delete the user records from the database that match the records in the input XML file.
- Schedule the bulk import job.
- View the details of an import job:
  - Job scheduled time
  - Job end time
  - Job status
  - Job completion status in percentage
  - Total number of user records in the input file
  - Total number of user records with warnings in the input file
  - Total number of user records that fail to import in the input file
  - The link to the Scheduler user interface
- Cancel or delete an import job.
- View logs of records that fail to import and require manual intervention.
- Download failed records in an XML file. The XML file conforms to XML schema definition. You can modify the failed records and import the records again to the database.

The following two XML schema definitions are available based on the complete and partial import types:

- XML schema definition for bulk import of users: See [XML Schema Definition for bulk import of users](#) on page 408. Use this XML schema definition to add and update (Merge/Replace) users. This schema addresses complete user attributes. For a sample XML that conforms to the XML schema definition, see [Sample XML for bulk import of users with minimal attributes](#) on page 415 and [Sample XML for bulk import of users with all attributes](#) on page 415.

- XML schema definition for partial import of users: See [XML Schema Definition for partial import of user attributes](#) on page 423. Use the XML schema definition to add and update (Merge/Replace) users. You must use this schema to import users with specific user attributes. For a sample XML that conforms to this XML schema definition, see [Sample XML for partial import of user attributes](#) on page 425.

To delete bulk users, a separate XML schema definition is defined. See [XML Schema Definition for bulk deletion of users](#) on page 427. For a sample XML that conforms to delete bulk users XML schema definition, see [Sample XML for bulk deletion of users](#) on page 428.

## Configuration options for bulk import using Excel

You can bulk import only the supported user attribute data for users. The Excel file must be the downloaded Excel template file or exported Excel file.

The following configuration options are available for import of users by using the Excel file:

- Abort or continue the import process when the import user operation encounters first error in the user input file.
- Import users with specific or all user attributes that Excel supports.
- If a matching record already exists, you can:
  - Merge the user attribute data from the imported file to the existing data. For example, you can add a new handle to the existing user.
  - Delete the user records from the database that match the records in the input Excel file.
- Schedule the bulk import job.
- View the details of an import job:
  - Job scheduled time
  - Job end time
  - Job status
  - Job completion status in percentage
  - Total number of user records in the input file
  - Total number of user records with warnings in the input file
  - Total number of user records that fail to import in the input file
  - The link to the Scheduler user interface
- Cancel or delete an import job.
- View logs of records that fail to import and require manual intervention.

## Bulk importing of users

### Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.

2. Click **Import > User Management > Users**.

Also, to gain access to **Import users**, from the System Manager web console, click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Users**.

3. On the Import users page, in the **Select Import File Type** field, select one of the following file types:

- XML
- Excel

 **Note:**

Use the Excel template that System Manager supports. If you use an unsupported template, the system displays a message `<file_name>.xlsx file is not a valid excel template for the current System Manager release`. Use the Excel template that you downloaded or exported from the current System Manager release.

4. On the Import users page, in the **Select File** field, type the complete path of the file or click **Browse** to locate and select a file.

5. Select one of the following error configuration options:

- **Abort on first error**
- **Continue processing other records**

6. For the XML file type, click **Complete** in the import type.

If you select the Excel file type, the system does not display the import type option.

7. Select one of the following import options:

- To skip users in the import file that match the existing user records in the database, click **Skip**.
- To replace the users in the database with new users from the imported file, click **Replace**. Use this option to import new users and retain the existing users.  
If you select Excel file type, the system does not display the replace option
- To update and merge the user attributes data from the imported file to the existing data, click **Merge**.
- To delete the user records in the database that match the records in the imported file, click **Delete**.

 **Note:**

For import by using Excel, the system deletes the user records permanently.

8. To run the job, in the Job Schedule section, select one of the following:

- To import the users immediately, click **Run immediately**.
- To import the users at a specified time, click **Schedule later**, and set date and time.

## 9. Click **Import**.

If you use the default configurations option **Importing Users > Add Users** in the database, the system imports the next user record even if the import user operation encounters an error while importing a user record. The system logs an error. Skip import of users that already exist in the database. The system schedules the import job to run immediately.

### **Note:**

The operations, Communication Manager synchronization and bulk import of users, must not overlap in time. When bulk import of users is in progress and if Communication Manager synchronization starts, the records that are in process fail. When synchronization is complete, the remaining bulk import records process successfully. You must reimport the records that fail to import during synchronization.

## Downloading the Excel template file

### About this task

To import or export by using an Excel file, you must use the Excel template file that System Manager supports. System Manager validates and displays a message if you use an unsupported Excel file.

### Procedure

1. On the System Manager web console, click **Users > User Management**.
2. In the navigation pane, click **Manage Users**.
3. On the User Management page, click **More Actions > Download Excel Template**.
4. In the Opening <Excel template file name>.xlsx dialog box, click **Save File**, and click **OK**.

### **Important:**

Though the header fields in the Excel template are editable, do not change any header information in the worksheets. The import or export might fail if you modify the headers.

For the sample Excel template, see the Excel template for bulk import and export that you download from the User Management page.

## Bulk export of users

In System Manager, you can export users in bulk from the System Manager database. While exporting in bulk, the system exports the data to an XML file.

You can export the following user attributes in bulk:

- Identity data
- Communication profile set
- Handles
- Communication profiles

The supported communication profiles are CM Endpoint, CM Agent, Messaging, Session Manager, CS 1000 Endpoint, Conferencing, IP Office, Presence, Avaya Breeze<sup>®</sup> platform, Work Assignment, Avaya Messaging, and Avaya Meetings Server.

### **Note:**

For security reasons, the system does not export the password fields in the XML file.

You can export the following global settings attributes in bulk:

- Public Contact Lists
- Shared Addresses
- Default access control list (ACLs)

The Export User process creates an archive file containing one or more XML files. While exporting users records, if the number of exported records exceed the limit of records that an XML file can hold, the system creates multiple XML files. The system packages the XML files in a zip file.

The XML file conforms to the XML schema definition that supports import of user. This schema addresses the complete user attributes, for more information, see [XML Schema Definition for bulk import of users](#) on page 408.

The system generates the XML file on the System Manager server. You can specify the location of the file you want to export while running the Export User job.

You can schedule an export user job. The job parameter provides an option to specify the schedule time in the YYYY:MM:DD:HH:MM:SS format. If you do not specify this parameter, the present job runs immediately.

When you import the same file to a new system, you must provide the password for users with any administrative role. For security reasons, the system does not export the **Password** fields to the XML file. Therefore, import of users with any administrative role fails, if the password is not provided.

To import users with any administrative role, in the XML file for the users, add the following XML tag after the `<username>` tag:

```
<userPassword> provide password for user </userPassword>
```

For **Partial Merge/Replace** import type, if you do not specify the password, the existing password remains.

You can export user data in bulk from System Manager web console.

### Bulk export users directory

The bulk export users zip files are stored in the `/var/avaya/bulkadministration/export/` directory. The total file size of exported zip files is monitored as per the value of the **max\_bulk\_export\_files\_directory\_size\_allowed** property in the `$MGMT_HOME/bulkadministration/exportutility/config/bulkexportconfig.properties` directory. The default file size for bulk export user is 1-GB. You can change the file size value for bulk export user to maximum 2-GB.

The system runs the check for the total size of the files in the `/var/avaya/bulkadministration/export/` directory on a daily basis. If the file size is greater than **max\_bulk\_export\_files\_directory\_size\_allowed**, the system automatically deletes the oldest files to make the size less than or equal to **max\_bulk\_export\_files\_directory\_size\_allowed**.

#### \* Note:

If there is only one file in `/var/avaya/bulkadministration/export/`, the system does not delete the file.

## Exporting users in bulk from web console

### About this task

With bulk export you can export the delta of users for a specified period of time. Delta users are the added, updated, or deleted users for the specified period of time. This feature is useful for performing bulk export of the entire System Manager user database that can be used with the external applications. This feature enables you to export only the users that have changed during the defined interval.

#### ! Important:

- The system runs the export users job that you schedule only once. To export users the next time, you must create a new export job by using this procedure. You cannot reschedule an existing export job.
- Increasing number of users per file in bulk export configuration beyond verified default limit consumes system resources. It results in degrading system performance and can cause system crash.

### Procedure

1. On the System Manager web console, click **Users > User Management**.
2. On the User management page, click one of the following:
  - **More Actions > Export All Users** to export user records for all users.
  - **More Actions > Export Selected Users** to export user records for the users that you select.

#### \* Note:

- If you select specific users from the list and click **Export All**, the system exports the records of all users instead of the selected records.

- If you provide the criteria in **Advanced Search** and click **Export All**, the system exports only the records that match the criteria.

- **More Actions > Export Delta Users** to export the delta of users for a specified period of time.

The system displays the Export Users page.

3. In the Export File Type Options section, in **Select Export File Types**, click **Xml**, **Excel** or both.

 **Note:**

Select at least one option. If you do not select a file type, and click **Export**, the export operation does not start. The page displays the message `Export File Type/Types Not Selected`. Select `Export File Types Xml` or `Excel` or `Both`.

If you select only **Excel**, the system automatically clears the **Contacts** check box in **User Attribute Options** because excel file does not support importing and exporting user contacts. The page also displays a message `Excel file does not support contacts` beside the **Contacts** check box.

4. **(Optional)** In the User Attribute Options section, select one or more check boxes to export contacts and specific communication profiles.

By default, the system exports basic attributes, communication profiles, and contacts.

For more information, see “Export Users field descriptions”.

5. In the Delta Period Options section, from **Select the delta period**, select the delta period to generate the file for the delta of users.

The Delta Period Options section is available only if you select the **Export Delta Users** option.

For more information, see “Export Users field descriptions”.

For example, if you select the delta period as **One Week**, schedule the job with the **Run immediately** option, and export file type as both XML and Excel, then the exported zip file contains the following:

- An `XML` file with added or updated users in last one week.
- An `Excel` file with added or updated users in last one week.
- A `deleted users .txt` file only if there are any permanently deleted users in the specified delta period.

6. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.

For more information, see “Export Users field descriptions”.

 **Important:**

The export users job that you schedule runs only once. To export users the next time, you must create a new export job by using this procedure. You cannot reschedule an existing export job.

7. Click **Export** to complete the export operation.

The system exports the user data to the XML and Excel file.

8. To view the data, in the **Export List** section, click the link in the **Download File** column.

To use the exported excel file for operations such as reimporting, while exporting users from the Export Users page, clear the **Contacts** check box in User Attribute Options. Excel export or import operations does not support export or import of contacts that are associated with the user.

|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p>User attribute options that an export administrator can choose to export for an export job.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>All:</b> The system exports all user attributes that includes all communications profiles and contacts. The default is <b>All</b>.</li> <li>• <b>Communications Profiles:</b> The export administrators can select communication profiles they want to export. For example : If the administrator selects all check boxes and clears the Session Manager profile check box, the system exports users with all data except the Session Manager communication profile attributes.</li> <li>• <b>Contacts:</b> The system exports all contacts. The system does not exports contacts if the check box is clear.</li> </ul> <p> <b>Note:</b></p> <p>When you select the <b>Contacts</b> check box, the system exports the contacts of users only to an XML file. The system does not support exporting contacts to an Excel file.</p> <p> <b>Important:</b></p> <p>If the exported file is used to import by using the replace option, the import operation replaces the existing user data from the system with user data in the exported file that might be incomplete because of the filter applied during the export.</p> |

## Delta Period options

The Delta Period Options section is available only if you select the **Export Delta Users** option.

| Name                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select the delta period</b> | <p>Following are the delta period options:</p> <ul style="list-style-type: none"> <li>• <b>One Day:</b> is exact past one day from current system date and time for run immediately or exact past one day from scheduled job time.</li> <li>• <b>One Week:</b> is exact past one week from current system date and time for run immediately or exact past one week from scheduled job time.</li> <li>• <b>One Month:</b> is exact past one month from current system date and time for run immediately or exact past one month from scheduled job time.</li> </ul> <p> <b>Note:</b></p> <p>The system creates the <code>XML</code> and <code>Excel</code> file even if there are no added or updated users in the specified delta period. If there are no added or updated users in the specified delta period then the <code>XML</code> and <code>Excel</code> files contain zero users data. However, the system creates the <code>.txt</code> file only if there are any permanently deleted users in the specified delta period.</p> |

| Name              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Recurrence</b> | <p>Following are the options:</p> <ul style="list-style-type: none"> <li>• <b>Execute task one time only:</b> The job is executed only once at the specified scheduled start time.</li> <li>• <b>Tasks are repeated:</b> The options are <b>Daily</b>, <b>Weekly</b>, and <b>Monthly</b>. The job is repeated as per the selection.</li> </ul> <p> <b>Note:</b></p> <p>If you select the <b>Tasks are repeated</b>, the system enables the <b>Range</b> field.</p> <p> <b>Note:</b></p> <p>The delta period selected for the <b>Export Delta Users</b> option for scheduled or recurring jobs will consider the exact delta period past to the exact start date and time of execution of the scheduled jobs.</p> <p>For example, if a delta export job is scheduled to run on December 17, 2017 at 2:00 p.m. with the delta period of <b>One Day</b>, then the delta of users is identified from December 16, 2017 from 2.00 p.m.</p> <p>For recurrence jobs, if a job is configured to run multiple times then the last exported zip file with the name <code>&lt;Scheduled Job Name&gt;.zip</code> will be available on the Export Users page for download. However, the previously exported zip files will be stored in the <code>/var/avaya/bulkadministration/export/</code> directory with the name <code>&lt;Scheduled Job_Date_time_In_UTC&gt;.zip</code>.</p> <p>Where <i>Date_time_In_UTC</i> is the date and time in UTC when the file was last-updated or created in the last run of the job.</p> <p>For example, if the admin started a recurring job at 18 Dec 2017 14:32:26 UTC to run for say 3 recurrences daily then after the completion of all 3 recurrences there will be 3 files available in the <code>/var/avaya/bulkadministration/export/</code> directory with following names: <code>users_1503066729239_18-Dec-2017_14:32:37_UTC.zip</code>, <code>users_1503066729239_19-Dec-2017_14:32:32_UTC.zip</code>, and <code>users_1503066729239.zip</code>.</p> |
| <b>Range</b>      | <p>Following are the options:</p> <ul style="list-style-type: none"> <li>• <b>No End Date:</b> The job has no end date and executed as per the selection in the <b>Tasks are repeated</b> field.</li> <li>• <b>End After Occurrences:</b> The job is executed as per the selection in the <b>Tasks are repeated</b> field for the number of occurrences specified in <b>End After Occurrences</b>.</li> <li>• <b>End By Date:</b> The job is executed and the recurrence ends when the end date is reached.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Button        | Description                                                                |
|---------------|----------------------------------------------------------------------------|
| <b>Export</b> | Exports or schedules the export job based on the option that you selected. |

## Export List

| Name                    | Description                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select check box</b> | The option to select a job.                                                                                                                                                                                                                                                                                                                               |
| <b>Start Time</b>       | The date and time when the job was scheduled.                                                                                                                                                                                                                                                                                                             |
| <b>Status</b>           | The status of the job. The options are: <ul style="list-style-type: none"> <li>• PENDING EXECUTION: The job is in queue.</li> <li>• RUNNING: The job execution is in progress.</li> <li>• SUCCESSFUL: The job execution is completed.</li> <li>• INTERRUPTED: The job execution is cancelled.</li> <li>• FAILED: The job execution has failed.</li> </ul> |
| <b>Scheduled Job</b>    | A key to the Scheduler page. You can cancel the job from the Scheduler page.                                                                                                                                                                                                                                                                              |
| <b>% Complete</b>       | The job completion status in percentage.                                                                                                                                                                                                                                                                                                                  |
| <b>User Records</b>     | The total number of user records that are marked for export.                                                                                                                                                                                                                                                                                              |
| <b>Failed Records</b>   | The number of user records that failed to export.                                                                                                                                                                                                                                                                                                         |
| <b>Download File</b>    | The link to download the zip file that contains XML and Excel files.                                                                                                                                                                                                                                                                                      |

| Button              | Description                                      |
|---------------------|--------------------------------------------------|
| <b>View</b>         | Displays the details of the selected job.        |
| <b>Stop</b>         | Stops the export operation for the selected job. |
| <b>Delete</b>       | Deletes the job that you selected.               |
| <b>Refresh</b>      | Refreshes the job details.                       |
| <b>Select: All</b>  | Selects all the jobs from the list.              |
| <b>Select: None</b> | Clears the check box selections.                 |
| <b>Previous</b>     | Displays jobs in the previous page.              |
| <b>Next</b>         | Displays jobs in the next page.                  |
| <b>Done</b>         | Returns to the User Management page.             |

## Configuring the maximum file size for automatically removing the exported zip files from the bulk export users directory

### Procedure

1. Log in to the System Manager command line interface with administrator privilege CLI user credentials.

2. From the `$MGMT_HOME/bulkadministration/exportutility/config` location, open the `bulkexportconfig.properties` file.
3. In the `bulkexportconfig.properties` file, change the value of **max\_bulk\_export\_files\_directory\_size\_allowed**.

Do not enter the decimal value for the file size. The default file size for bulk export user is 1-GB. You can change the file size value for bulk export user to maximum 2-GB.

## Configuration options for bulk import of users

You can bulk import only the selected user attributes data for one or more users existing in the database. The XML file must conform to XML schema definition, for more information, see [XML Schema Definition for partial import of users](#) on page 423. For a sample XML file for import of user, see [Sample XML for partial import of users](#) on page 425.

The following configuration options are available for import of users:

- Abort or continue the import process when the import user operation encounters first error in the user input file.
- Perform one of the following import types:
  - The partial import type. Helps import of users with specific user attributes.
  - The complete import type. Helps import of users with all user attributes.
- If a matching record already exists, you can:
  - Replace the users in the database with the new users from the file you imported. For example, you can replace the existing contact list for a user with a new contact list.
  - Merge the user attributes data from the imported file to the existing data. For example, you can add a new contact in the list of contacts for the user and update the name of the user.
  - Delete the user records from the database that match the records in the input XML file.
- Schedule the bulk import job.
- View the details of an import job:
  - Job scheduled time
  - Job end time
  - Job status
  - Job completion status in percentage
  - Total number of user records in the input file
  - Total number of user records with warnings in the input file
  - Total number of user records that fail to import in the input file
  - The link to the Scheduler user interface
- Cancel or delete an import job.

- View logs of records that fail to import and require manual intervention.
- Download failed records in an XML file. The XML file conforms to XML schema definition. You can modify the failed records and import the records again to the database.

## Bulk importing of partial user attributes for a user

### Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Users**.

Also, to gain access to **Import users**, from the System Manager web console, click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Users**.

3. On the Import users page, in the **Select Import File Type** field, select one of the following file types:
  - XML
  - Excel

#### **Note:**

Use the Excel template that System Manager supports. If you use an unsupported template, the system displays a message `<file_name>.xlsx file is not a valid excel template for the current System Manager release`. Use the Excel template that you downloaded or exported from the current System Manager release.

4. Select one of the following error configuration options:
  - **Abort on first error**
  - **Continue processing other records**
5. Select **Partial** as the import type.
6. Select one of the following options to handle matching records:
  - To replace the existing attribute data of a matching user in the database with the new data from the imported file, click **Replace**.
  - To update and merge the user attributes data from the imported file to the existing data, click **Merge**.
7. To run the job, in the Job Schedule section, select one of the following:
  - To import the users immediately, click **Run immediately**.
  - To import the users at a specified time, click **Schedule later**, and set date and time.
8. Click **Import**.

## Making exported user data compatible for partial user import

Use this section to update user attributes partially. XML file format contains the user records that System Manager exports. You must update selected user attributes in the exported XML file and then import the XML file. You require this procedure because export users generate XML file conforming to this XML Schema Definition. For more information, see [XML Schema Definition for bulk import of users](#) on page 408. Partial import type uses a different XML schema definition, for more information, see [XML Schema Definition for partial import of user attributes](#) on page 423.

### Before you begin

Export the users in bulk and generate the XML file.

### About this task

For partial import of users, make the following changes in the user export XML file. You can generate the XML file by exporting users in bulk.

### Procedure

#### 1. Perform the following steps:

##### a. Locate the following content in the generated XML file:

```
<tns:users xmlns:tns="http://xml.avaya.com/schema/import"
xmlns:ns3="http://xml.avaya.com/schema/import1"
xmlns:ns4="http://xml.avaya.com/schema/deltaImport"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://xml.avaya.com/schema/import userimport.xsd">
```

##### b. Modify `tns:users` to `tns:deltaUserList`.

##### c. Remove `tns="http://xml.avaya.com/schema/import"`.

##### d. Modify `ns4="http://xml.avaya.com/schema/deltaImport"` to `tns="http://xml.avaya.com/schema/deltaImport"`

##### e. Modify `xsi:schemaLocation="http://xml.avaya.com/schema/import userimport.xsd">` to `xsi:schemaLocation="http://xml.avaya.com/schema/deltaImport userdeltaimport.xsd ">`

After you modify the XML file as instructed in Step b through Step e, the content in Step a changes to:

```
<tns:deltaUserList xmlns:ns3="http://xml.avaya.com/schema/import1"
xmlns:tns="http://xml.avaya.com/schema/deltaImport"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://xml.avaya.com/schema/deltaImport userdeltaimport.xsd ">
```

2. Replace all instances of:

- `<tns:user>` with `<tns:userDelta>`
- `</tns:user>` with `</tns:userDelta>`
- `<tns:users>` with `<tns:deltaUserList>`
- `</tns:users>` with `</tns:deltaUserList>`

### Next steps

You can now make the updates in the XML file and import the changes to update the user attributes in the database.

## About Bulk Import Encryption utility

System Manager Import User supports import of encrypted user password field and the plain text Communication Profile password field into the database. For importing a user XML file with encrypted password, System Manager provides BulkImportEncryptionUtil, a utility tool that encrypts the “userPassword” and “commPassword” fields in the user import input file.

The utility tool takes an XML file with plaintext password field values as input. This utility encrypts the password fields and generates an XML file with encrypted password field. You can use the XML file to import user.

BulkImportEncryptionUtil is a standalone Java program. You can run the utility on any machine that has Java installed on it.

## Encrypting passwords in user import file using BulkImportEncryptionUtil running on Windows

### Before you begin

JDK 1.6 is installed on your computer. If the computer does not have JDK 1.6 installed, use the <http://java.sun.com/javase/downloads/index.jsp> URL to download JDK 1.6.

### Procedure

1. Extract the contents of the `um_bulkimport-encryptUtil.zip` file from `$MGMT_HOME/upm/utilities` into a local folder.

The `um_bulkimport-encryptUtil.zip` file contains the following files:

- `um_bulkimport-encryptUtil.jar`
- `log4j.jar` and script files
- `um_bulkimport-encryptUtil.bat`
- `um_bulkimport-encryptUtil.sh`
- `Readme.txt`

2. At the command prompt, type `um_bulkimport-encryptUtil.bat <import|deltaimport> <xmlfilename> <basenamespaceprefix> <deltanamespaceprefix>`, where:

- `import|deltaimport` specifies whether the input XML file has data for complete import or partial import. For complete import, this option value is `import` and for partial import this option value is `deltaimport`.
- `xmlfilename` is the name of the XML file with complete path of the XML file that contains the data for importing the users data
- `basenamespaceprefix` is the namespace prefix in the input XML file. In the following example, `tns` is the value for the `basenamespaceprefix` parameter.

```
<?xml version="1.0" encoding="UTF-8"?>
<tns:users xmlns:tns="http://xml.avaya.com/schema/import"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://xml.avaya.com/schema/import
userimport.xsd" >
```

- `deltanamespaceprefix` is the namespace prefix given in the partial import file. Specify this parameter if you are performing a partial import. In the following example, the `deltanamespaceprefix` value is `delta` and `basenamespaceprefix` value is `tns`.

```
<?xml version="1.0" encoding="UTF-8"?>
<delta:deltaUserList
xmlns:delta="http://xml.avaya.com/schema/deltaImport"
xmlns:tns="http://xml.avaya.com/schema/import"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://xml.avaya.com/schema/deltaImport
userdeltaimport.xsd ">
```

## Encrypting passwords in user import file using BulkImportEncryptionUtil running on Linux

### Before you begin

Install JDK 1.6 on your computer. If the computer does not have JDK 1.6 installed, use the <http://java.sun.com/javase/downloads/index.jsp> URL to download JDK 1.6.

### Procedure

1. Extract the contents of the `um_bulkimport-encryptUtil.zip` file from `$MGMT_HOME/upm/utilities` into a local folder.

The `um_bulkimport-encryptUtil.zip` file contains the following files:

- `um_bulkimport-encryptUtil.jar`
- `log4j.jar` and script files
- `um_bulkimport-encryptUtil.bat`
- `um_bulkimport-encryptUtil.sh`

- Readme.txt
- 2. At the command prompt, type `um_bulkimport-encryptUtil.sh <import|deltaimport> <xmlfilename> <basenamespaceprefix> <deltanamespaceprefix>`, where:
  - *import* | *deltaimport* specifies whether the input XML file has data for complete import or partial import. For complete import, this option value is *import* and for partial import this option value is *deltaimport*.
  - *xmlfilename* is the name of the XML file with complete path of the XML file that contains the data for importing the users data
  - *basenamespaceprefix* is the namespace prefix in the input XML file. In the following example, *tns* is the value for the *basenamespaceprefix* parameter.

```
<?xml version="1.0" encoding="UTF-8"?>
<tns:users xmlns:tns="http://xml.avaya.com/schema/import"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://xml.avaya.com/schema/import
userimport.xsd" >
```

- *deltanamespaceprefix* is the namespace prefix given in the partial import file. Specify this parameter if you are performing a partial import. In the following example, the *deltanamespaceprefix* value is *delta* and *basenamespaceprefix* value is *tns*.

```
<?xml version="1.0" encoding="UTF-8"?>
<delta:deltaUserList
xmlns:delta="http://xml.avaya.com/schema/deltaImport"
xmlns:tns="http://xml.avaya.com/schema/import"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://xml.avaya.com/schema/deltaImport
userdeltaimport.xsd ">
```

## Import user considerations

- If the *comprofileset* has associated *handlelist* or *commprofilelist*, you cannot merge or replace *commprofileset* attributes name and *lsprimary*.

To move *handlelist* and *commprofilelist* from one *commprofileset* to another, perform the following:

1. Perform Replace - Import file with no *commprofileset*.
  2. Perform Update (merge/replace) - Import file with the new *commprofileset* with associated *handlelist* and *commprofiles*.
- For security reasons, you do not export the **Password** fields in the XML file.

When you import the same file to a new system, you must provide the password for users with any administrative role. For security reasons, the system does not export the **Password** fields to the XML file. Therefore, import of users with any administrative role fails, if the password is not provided.

To import users with any administrative role, in the XML file for the users, add the following XML tag after the `<username>` tag:

```
<userPassword> provide password for user </userPassword>
```

For **Partial Merge/Replace** import type, if you do not specify the password, the existing password remains.

- To enhance the performance of a file with large user records, split the file into smaller file sizes. For example, you can split a user import file of 15 Kb into three files of 5 Kb each. To speed up the import process, schedule three import jobs in parallel. System Manager has the ability to process multiple files concurrently.

## Scheduling a user import job

System Manager supports scheduling of bulk import jobs from the System Manager console. You can schedule a job to run immediately or at a later time.

### Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Users**.

Also, to gain access to **Import users**, from the System Manager web console, click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Users**.

3. On the Import users page, in the **Select Import File Type** field, select one of the following file types:
  - XML
  - Excel

#### **Note:**

Use the Excel template that System Manager supports. If you use an unsupported template, the system displays a message `<file_name>.xlsx file is not a valid excel template for the current System Manager release`. Use the Excel template that you downloaded or exported from the current System Manager release.

4. Select one of the following error configuration options:
  - **Abort on first error**
  - **Continue processing other records**
5. Select one of the following import options:
  - To skip users in the import file that match the existing user records in the database, click **Skip**.
  - To replace the users in the database with new users from the imported file, click **Replace**. Use this option to import new users and retain the existing users.

If you select Excel file type, the system does not display the replace option

- To update and merge the user attributes data from the imported file to the existing data, click **Merge**.
- To delete the user records in the database that match the records in the imported file, click **Delete**.

 **Note:**

For import by using Excel, the system deletes the user records permanently.

6. In the Job Schedule section:

a. Click **Schedule later**.

To run the user import job immediately, click **Run immediately**. When you select this option, the fields related to scheduling become unavailable.

b. In the **Date** field, type the date.

You can use the calendar icon to select a date.

c. In the **Time** field, type the time in the HH:MM:SS format.

d. In the **Time Zone** field, type the time zone.

7. Click **Import**.

The page displays the scheduled job in the Manage Jobs section.

## Aborting a user import job on first error

System Manager supports the following error configurations:

- Abort on first error: Aborts import of the user records when the import user operation encounters the first error in the import file containing the user records.
- Continue processing other records: Imports the next user record even if the import user operation encounters an error while importing a user record.

### About this task

The user import process may encounter errors at the time of importing of users. Use this feature to configure actions when you encounter the first error. You can choose to abort the user import process or continue the import process.

### Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Users**.

Also, to gain access to **Import users**, from the System Manager web console, click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Users**.

3. On the Import users page, in the **Select Import File Type** field, select one of the following file types:
  - XML

- Excel

**\* Note:**

Use the Excel template that System Manager supports. If you use an unsupported template, the system displays a message `<file_name>.xlsx file is not a valid excel template for the current System Manager release.` Use the Excel template that you downloaded or exported from the current System Manager release.

4. Click **Abort on first error** to choose error configuration options.
5. Select one of the following import options:
  - To skip users in the import file that match the existing user records in the database, click **Skip**.
  - To replace the users in the database with new users from the imported file, click **Replace**. Use this option to import new users and retain the existing users.  
If you select Excel file type, the system does not display the replace option
  - To update and merge the user attributes data from the imported file to the existing data, click **Merge**.
  - To delete the user records in the database that match the records in the imported file, click **Delete**.

**\* Note:**

For import by using Excel, the system deletes the user records permanently.

6. Choose or enter the appropriate information for remaining fields.
7. Click **Import**.

## Canceling a user import job

You can cancel a job only when the job is in the PENDING EXECUTION or RUNNING state.

### Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Users**.  
Also, to gain access to **Import users**, from the System Manager web console, click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Users**.
3. On the Import Users page, select the job from the table in the Manage Jobs section.
4. Click **Cancel job**.

## Deleting a user import job

System Manager supports deleting of jobs. **Delete job** option removes the job information from the database.

## About this task

You can delete a job only when the status of the job is SUCCESSFUL. To interrupt a job that is running or pending, use the **Cancel job** option.

## Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Users**.  
Also, to gain access to **Import users**, from the System Manager web console, click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Users**.
3. On the Import Users page, select the job to delete from the table in the Manage Jobs section.
4. Click **Delete job**.

## Viewing a user import job on the Scheduler page

You can view an import job on the Scheduler Web page. You can perform all operations on a job that Scheduler supports from the Scheduler page.

## Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Users**.  
Also, to gain access to **Import users**, from the System Manager web console, click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Users**.
3. On the Import Users page, select a job from the table in the Manage Jobs section.
4. Click the link displayed in the **Job Name** column.

The Scheduler page displays the details of the job. You can perform operations on the job that the Scheduler supports for the job.

## Viewing the details of a user import job

You can view the following details of an import job:

- Job name
- Job scheduled by
- Job scheduled start time
- Selected error configuration option
- Selected import type option
- Selected import option
- Job end time

- Job status
- Import file name
- Total number of user records in the import file
- Total number of user records successfully imported
- Total number of user records that failed to import
- Total number of warnings
- Percentage complete status

### About this task

You can view the error message for each user record that fails to import. You can download the failed user records in an XML file format. You can modify the XML file and import the file again.

### Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Users**.  
  
Also, to gain access to **Import users**, from the System Manager web console, click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Users**.
3. On the Import Users page, select a job to view from the table in the Manage Jobs section.
4. Click **View job**.

The Job Detail page displays the details of the selected job.

## Bulk import of global user settings

You can use the *Import Global Settings* functionality to import global settings in bulk from an XML file. The XML file must conform to XML schema definition, for more information, see [XML Schema Definition for bulk import of global setting records](#) on page 508. For sample XML file for import global settings, see [Sample XML for bulk import of global setting records](#) on page 514.

You can perform the following tasks with Import Global Settings:

- Abort or continue the import process when the import operation encounters first error in the global user settings input file.
- Skip importing the global user settings records that already exist in the database. Use this option to import new global user settings records and retain the existing users.
- Update and merge the global user settings attributes data from the imported file to the existing data in the attributes.
- Replace all the global user settings records in the database with the global user settings records from the imported file.
- Delete the global setting records from the database that match the records in the input XML file.

- Schedule the bulk import job.
- View the details of an import job:
  - Job scheduled time
  - Job end time
  - Job status
  - Job completion status in percentage
  - Total number of global settings records in the input file
  - The number of global settings records with warnings in the input file
  - The number of global settings records fail to import in the input file
  - The link to the Scheduler user interface
- Cancel or delete an import job.
- View logs of records that fail to import and require manual intervention.
- Download failed records in an XML file. The XML file conforms to XML schema definition. You can modify the failed records and import the records again to the database.

To add and update (Merge and Replace) global settings use [XML Schema Definition for bulk import of global setting records](#) on page 508.

To delete bulk global settings, use the XML schema definition for global settings delete, see [XML Schema Definition for bulk deletion of global setting records](#) on page 518. For a sample XML conforming to delete bulk global settings XML schema definition, see [Sample XML for bulk deletion of users](#) on page 428.

## Bulk importing the global user settings

### Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Global Settings**.

To gain access to **Import Global Settings**, from the System Manager Console you can also click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Global Settings**.
3. On the Import Global Settings page, enter the complete path of the file in the **Select file** field.

Also, you can click **Browse** to select a file.
4. Select one of the following error configuration options:
  - **Abort on first error**
  - **Continue processing other records**

5. Select one of the import options:
  - **Skip**
  - **Replace**
  - **Merge**
  - **Delete**
6. In the **Job Schedule** section, select one of the following options:
  - To run the import job immediately, click **Run immediately**.
  - To run the import job at a later time, click **Schedule later** and set the date and time.
7. Click **Import**.

### Related links

[About bulk import of users](#) on page 377

[List of XML Schema Definitions and sample XMLs for bulk import](#) on page 408

[Bulk import of global user settings](#) on page 401

## Bulk export of global user settings

In System Manager, you can export global settings in bulk from the System Manager database.

You can export the following global settings attributes in bulk:

- Public Contact Lists
- Shared Addresses
- Default access control list (ACLs)

The Export User process creates an archive file containing one or more XML files. While exporting the global settings records, if the number of exported records exceed the limit of records that an XML file can hold, the system creates multiple XML files. The system packages the XML files in a zip file.

The XML file conforms to the XML schema definition that supports import of global settings. This schema addresses the complete global settings attributes. For more information, see [XML Schema Definition for bulk import of global setting records](#) on page 508.

The system generates the XML file on the System Manager server. You can specify the location of the file you want to export while running the Export User job.

You can schedule an export global settings job. The job parameter provides an option to specify the schedule time in the YYYY:MM:DD:HH:MM:SS format. If you do not specify this parameter, the present job runs immediately.

You can export user data in bulk from System Manager web console.

## exportUpmGlobalsettings.sh command

Use the **exportUpmGlobalsettings** command to export global settings from the System Manager database.

## Syntax

```
exportUpmGlobalsettings.sh -f globalSettingExport-r-d -s -e-t
```

- f** The prefix of the file name for the file that you require to export.
- r** The number of records per file.
- d** The location of the file that you want to export.
- s** The start index of record.
- e** The number of records you want to export.
- t** The job scheduling time in the YYYY:MM:DD:HH:MM:SS format. If you do not specify this parameter, the present job runs immediately.
- o** The global settings export filter. The default is 0. You can set one of the following values for the global settings export filter:
  - **0** No Filter. 0 is considered as the start index value.
  - **1** System Default Type filter
  - **2** Enforced users filter
  - **3** System Rule Type filter
  - **4** System ACL Entry Type filter
  - **5** Shared Address filter
  - **6** Public Contact filter

## Scheduling a global user settings import job

### About this task

System Manager supports scheduling of bulk import jobs from the System Manager web console. With the scheduling utility, you can schedule an import job to run immediately or at a later time.

### Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Global Settings**.

To gain access to **Import Global Settings**, from the System Manager Console you can also click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Global Settings**.

3. On the Import Global Settings page, enter the complete path of the file in the **Select file** field.

Also, you can click **Browse** to select a file.

4. Select one of the following error configuration options:
  - **Abort on first error**
  - **Continue processing other records**
5. Select one of the import options:
  - **Skip**
  - **Replace**
  - **Merge**
  - **Delete**
6. In the **Job Schedule** section:
  - a. Click **Schedule later**.
 

To run the import job immediately, click **Run immediately**. After you select this option, the fields related to scheduling become unavailable.
  - b. In the **Date** field, type the date.
 

You can use the calendar icon to select a date.
  - c. In the **Time** field, type time in the HH:MM:SS format.
  - d. In the **Time Zone** field, select a time zone.
7. Click **Import**.
 

The system displays the scheduled job in the Manage Jobs section.

## Viewing details of a global user settings import job

You can view the following details of an import job:

- Job name
- Job scheduled by
- Job scheduled start time
- Job end time
- Job status
- Import file name
- Total number of user records in the import file
- Total number of user records successfully imported
- Total number of user records that failed to import
- Percentage complete status

### About this task

You can view the error message for each user record that fails to import. You can download the failed user records in an XML file format. You can modify the XML file and import the file again.

## Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Global Settings**.

To gain access to **Import Global Settings**, from the System Manager Console you can also click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Global Settings**.

3. On the Import Global Settings page, select a job from the table in the Manage Jobs section.
4. Click **View job**.

The Job Detail page displays the details of the selected job.

## Viewing a global user settings import job on the Scheduler page

### About this task

You can view and perform all operations on an import job that the scheduler supports from the Scheduler page.

### Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Global Settings**.

To gain access to **Import Global Settings**, from the System Manager Console you can also click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Global Settings**.

3. On the Import Global Settings page, select a job from the table in the Manage Job section.
4. Click the link in the **Job Name** column.

The Scheduler page displays the details of the job.

## Aborting a global user settings import job on first error

System Manager supports the following error configurations:

- Abort on first error. Aborts importing of the global settings records when the import global settings operation encounters the first error in the import file that contains the global settings records.
- Continue processing other records. Imports the next global settings record even if the import operation encounters an error while importing a global settings record.

### About this task

You can abort an import process when the import process encounters the first error in the input file while processing the global user settings records.

## Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Global Settings**.

To gain access to **Import Global Settings**, from the System Manager Console you can also click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Global Settings**.

3. On the Import Global Settings page, enter the complete path of the file in the **Select file** field.

Also, you can click **Browse** to select a file.

4. Select **Abort on first error** as the error configuration option.
5. Select one of the import options:
  - **Skip**
  - **Replace**
  - **Merge**
  - **Delete**
6. Choose or enter the appropriate information for the remaining fields.
7. Click **Import**.

## Deleting a global user settings import job

System Manager supports deletion of an import job. The **Delete job** option removes the job information from the database. You can delete a job only when the job is in the *SUCCESSFUL* state.

To interrupt a job that is running or pending, use the **Cancel job** option.

## Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Global Settings**.

To gain access to **Import Global Settings**, from the System Manager Console you can also click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Global Settings**.

3. On the Import Global Settings page, select a job from the table in the Manage Jobs section.
4. Click **Delete Job**.

## Canceling a global user settings import job

You can cancel a job only when the job is in the PENDING EXECUTION or RUNNING state.

## Procedure

1. On the System Manager web console, click **Services > Bulk Import and Export**.
2. Click **Import > User Management > Global Settings**.

To gain access to **Import Global Settings**, from the System Manager Console you can also click **Users > User Management**. Click **Manage Users** and select **More Actions > Import Global Settings**.

3. On the Import Global Settings page, select a job from the table in the Manage Jobs section.
4. Click **Cancel job**.

## List of XML Schema Definitions and sample XMLs for bulk import

The section contains the XML Schema Definition and sample XML snippets for bulk import of users, global setting records, elements, endpoint profiles, Messaging profiles, CS 1000 profiles, IP Office profiles, agent profiles, Session Manager profiles, Presence profiles, Avaya Breeze® platform, Work Assignment, Conferencing, Avaya Messaging, and Avaya Meetings Server profiles.

### \* Note:

You cannot use the following characters as is in the XML file. To use the characters in the import of XML files, make the following modifications:

- Less-than character (<) as &lt;
- Ampersand character (&) as &amp;
- Greater-than character (>) as &gt;
- Double-quote character (") as &quot;
- Apostrophe or single-quote character (') as &apos;

If you copy the XML schema from the document, take care of the line breaks.

### XML Schema Definition for bulk import of users

### Sample XML for bulk import of users with minimal attributes

```

<?xml version="1.0" encoding="UTF-8"?>
 <!-- Root Element 'Users' represent collection of user (containing 1 or
 more users)-->
 <tns:users xmlns:tns="http://xml.avaya.com/schema/import" xmlns:xsi="http://www.w3.org/
 2001/XMLSchema-instance" xsi:schemaLocation="http://xml.avaya.com/schema/import
 userimport.xsd" >

 <tns:user>
 <authenticationType>Basic</authenticationType>
 <givenName>John</givenName>
 <loginName>jmiller@avaya.com</loginName>
 <surname>Miller</surname>
 <userPassword>mypassword</userPassword>
 </tns:user>
 </tns:users>

```

### Sample XML for bulk import of users with all attributes

```

<?xml version="1.0" encoding="UTF-8"?>
<!-- Root Element 'Users' represent collection of user (containing 1 or more
users)-->
<tns:users xmlns:tns="http://xml.avaya.com/schema/import" xmlns:xsi="http://www.w3.org/
2001/XMLSchema-instance" xsi:schemaLocation="http://xml.avaya.com/schema/import
userimport.xsd">
<!-- authenticationType: This defines the type of authentication that this user
will undergo at runtime to obtain access to the system.
Possible Values: BASIC,ENTERPRISE
---description:A text description of the user. Human readable description of
this user instance.
---displayName:The localized name of a user to be used when displaying. It
will typically be the localized full name. This value may be provisioned
from the users enterprise directory entry. If it does not exist,
synchronization rules can be used to populate it for other fields
e.g. Surname, GivenName, or LoginName.
---displayNameAscii:This corresponds to the
Console attribute-Endpoint Display Name.
The full text name of the user represented in ASCII. It is used to support
display (e.g. endpoints) that cannot handle localized text
---dn:The distinguished name of the user. The DN is a sequence of relative
distinguished names (RDN) connected by commas. An RDN is an attribute with
an associated value in the form of attribute=value, normally expressed in a
UTF-8 string format.The dn can be used to identify the user and may be used
for authentication subject mapping. Note the dn is changeable.
---isDuplicatedLoginAllowed:A boolean indicator showing whether this user is
allowed a duplicate concurrent logins.A true stipulates that the user is
allow to have duplicate logins. Default value is true.
---isEnabled:A boolean indicator showing whether or not the user is active.
Users with AuthenticationType equals Basic will fail if this value is false.
This attribute can be used to disable access between login attempts.
A running sessions login will not be revocable. Alternatively the
administrator can always modify the password to disable the user from
logging in. A true stipulates this is an active user, a false used for a
disabled user. Default value is false.
---isVirtualUser:A boolean indicator showing whether or not the record is being
used for a non-human entity such as an application, service, software agent,
etc. This is to be used where the entity will behave as a user and needs to
have subset of the user profile populated. If the entity does not behave as

```

a user and has a different trust relationship e.g. a trust certificate it should not be treated as a virtual user. A virtual user can represent an Avaya or external non-human entity. This attribute is provided as a convenience to track such accounts. A true stipulates this is a virtual user, a false is used for human users. Default value is false.

---givenName:The first name of the user.

---honorific:The personal title used to address a user. This is typically a social title and not the work title which is contained in the title attribute. This attribute can map to PersonalTitle.

---loginName:This is the unique system login name given to the user. It can take the form of username@domain or just username. This may vary across customers. It can be used to help provision default user handles in the CSHandle table. The username is an alphanumeric value that must comply with the userinfo related portion of a URI as described in rfc3986.

.....userinfo / loginname = \*( unreserved / pct-encoded / sub-delims / ":" )  
 where <p>unreserved = ALPHA / DIGIT / "-" / "." / "\_" / "~"

.....pct-encoded = "%" HEXDIG HEXDIG  
 sub-delims = "!" / "\$" / "&" / "'" / "(" / ")" / "\*" / "+" / "," / ";" / "="

---employeeNo:Employee number of user.

---department:Department of employee.

---organization:Organization of employee.

---middleName:The middle name of the user.

---managerName:Text name of the users manager. This is a free formed field and does not require the users manager to also be a user of the solution. This attribute was requested to support reporting needs.

---preferredGivenName:The preferred first name of the user.

---preferredLanguage:The individuals preferred written or spoken language. Values will conform to rfc4646 and the reader should refer to rfc4646 for syntax. This format uses the ISO standard Language ISO639 and region ISO3166 codes. In the absence of a value the clients locale should be used, if no value is set, en-US should be defaulted.

---source:Free format text field that identifies the entity that created this user record. The format of this field will be either a IP Address/Port or a name representing an enterprise LDAP or Avaya.

---sourceUserKey:The key of the user from the source system. If the source is an Enterprise Active Directory server, this value will be the objectGUID.

---status:This information is to help manage provisioning activities such as correcting or completing the provisioning of a user instance. It can also signify that approval is needed (PENDINGAUTHZ) before a user account is sufficiently configured to be a valid user (PROVISIONED).  
 Possible Values: AUTHPENDING;PENDINGAUTHZ;PROVISIONED

---suffix:The text appended to a name e.g. Jr., III.

---surname:The users last name, also called the family name.

---timeZone:The preferred time zone of the user.  
 For example: (-12:0)International Date Line West.

---title:The job function of a person in their organizational context.

---userName:This is the username portion of the loginName field. It is an alphanumeric value that must comply with the userinfo related portion of a URI as described in rfc2396. However, it is further restricted as ASCII characters with \_ . - % ! ~ \* ( ) = + \$ , ; and ? special characters are supported.

This is the rfc2798 uid attribute.

---userPassword:The encrypted password for this users account. A null password is used when the user is authenticated by the enterprise such as with a separate source such as the enterprise LDAP.

---commPassword:The encrypted subscriber or communication password with which the user logs can use to authentication with on to any CommProfile SIP and non SIP. This attribute is meant to be a shared across different communication profiles and thus different communication services.

---userType:This enumerates the possible primary user application types. A User can be associated with multiple user types. Possible values are ADMINISTRATOR; COMMUNICATION USER; AGENT; SUPERVISOR; RESIDENT EXPERT; SERVICE TECHNICIAN; LOBBY PHONE

---roles:Text name of a role. This value needs to pre-exist in SMGR DB

---localizedNames:localized name of user.

```

---address:The address of the user.
---securityIdentity:The SecurityIdentity is used to hold any additional
identities for a user that can be used for authentication such as their
loginName, Kerberos account name, or their X509 certificate name.
---ownedContactLists:It is a collection of internal or external contacts.
ContactList is owned by a specific user and has a name that a unique name
within the context of its owner.
---ownedContacts:It represents a non Avaya application user (external) contact.
Contacts can be collected together along with User entities into a contact
list. Contacts can be created by an administrator or an end user.
---presenceUserDefault:These are personal rules that are set by presentities
to define how much presence information can be shown to watchers that are
not explicitly mentioned in an ACL. There may be one User Default rule per
presentity (User), or none.
---presenceUserACL:These are personal rules defined by presentities themselves
on who can monitor their presence information. There may be several entries
in the list for a given presentity, each entry corresponding to one watcher.
---presenceUserCLDefault:This is a personal rule that is set by presentities
to define how much presence information can be shown to watchers that belong
to the userss contact list. There may be one User Contact List Default rule
per presentity (Person) or none.
---commProfileSet:A user will have a default commprofile set.A commprofile set
can exist without any handles or commprofiles referencing it. I.e. you can
create a commprofile set without needing to also create either a handle or
a commprofile.A commprofile set can contain multiple commprofiles, but only
one of each specific type. This is enforced by having the CSCCommProfile
uniqueness constraint include type, cs_commpfile_set_id.

</ownedContactLists>
<!--
---Contact:An entity that represents a non Avaya application user (external)
 contact. Contacts can be collected together along with User entities into
 a contact list. Contacts can be created by an administrator or an end
 user. Contacts have name attributes, and owner, and can be public or
 personal. A contact also includes one or more contact addresses that can
 be used for establishing an interaction with the contact. Contacts can be
 designated as being a users presence buddy or added as a favorite entry
 For example, speed dial.
---company:The organization that the contact belongs to.
---description:A free text field containing human readable text providing
 information on this entry.
---displayName:The localized name of a contact to be used when displaying.
 It will typically be the localized full name. This value may be provisioned
 from the users enterprise directory entry. If it does not exist,
 synchronization rules can be used to populate it for other fields
 e.g. Surname, GivenName, or LoginName.
---displayNameAscii:The full text name of the contact represented in ASCII.
 It is used to support display (e.g. endpoints) that cannot handle

```

```

 localized text.
---dn:The distinguished name of the user. The DN is a sequence of relative
 distinguished names (RDN) connected by commas. An RDN is an attribute
 with an associated value in the form of attribute=value, normally expressed
 in a UTF-8 string format.The dn can be used to uniquely identify this
 record. Note the dn is changeable.
---givenName:The first name of the contact.
---initials:Initials of the contact
---middleName:The middle name of the contact.
---preferredGivenName:The nick name of the contact.
---preferredLanguage:The individuals preferred written or spoken language.
 Values will conform to rfc4646 and the reader should refer to rfc4646
 for syntax.This format uses the ISO standard Language ISO639 and region
 ISO3166 codes. In the absence of a value the clients locale should be
 used, if no value is set, en-US should be defaulted.
---isPublic:Defines if the contact is public or personal. Default = false.
---source:Free format text field that identifies the entity that created
 this user record. The format of this field will be either a
 IP Address/Port or a name representing an enterprise LDAP or Avaya.
---sourceUserKey:The key of the user from the source system. If the source is
 an Enterprise Active Directory server, this value will be the objectGUID.
---suffix:The text appended to a name e.g. Jr., III.
---surname:The users last name, also called the family name.
---title:The job function of a person in their organizational context.
 Examples: supervisor, manager
---ContactAddress:Represents a contacts address.
---addresses:A fully qualified URI for interacting with this contact. Any
 addresses added to this table should contain a qualifier e.g. sip, sips,
 tel, mailto. The address should be syntactically valid based on the
 qualifier. It must be possible to add via the GUI and Interface.
 The application must do validation.

<!--
Survivable GK Node Name Identifies the existence of other H.323
gatekeepers located within gateway products that offer survivable
call
features. For example, the MultiTech MVPxxx-AV H.323 gateway family
and the SLS function within the H.248 gateways. When a valid IP node
name is entered into this field, Communication Manager adds the IP
address of this gateway to the bottom of the Alternate Gatekeeper
List
for this IP network region. As H.323 IP stations register with
Communication Manager, this list is sent down in the registration
confirm message. This allows the IP station to use the IP address of
this Survivable Gatekeeper as the call controller of last resort to
register with. Available only if the station type is an H.323
station
(46xxor 96xx models).
Valid Entry Usage
Valid IP node name Any valid previously-administered IP
node name.
blank There are no external gatekeeper nodes
within a customer's network. This is the default value.
-->

 <!--
 H.320 Conversion - Valid entries are true and false (default). This
field is
 optional for non-multimedia complex voice stations and for Basic
 multimedia complex voice stations. It is mandatory for Enhanced
 multimedia complex voice stations. Because the system can only
handle
 a limited number of conversion calls, you might need to limit the
 number of telephones with H.320 conversion. Enhanced multimedia
 complexes must have this flag set to true.
 -->
 <xs:element name="h320Conversion" type="xs:boolean"
maxOccurs="1" minOccurs="0" />

 <!--
 The service link is the combined hardware and software multimedia
 connection between an Enhanced mode complex's H.320 DVC system and
the
 Avaya DEFINITY Server which terminates the H.320 protocol. A service
 link is never used by a Basic mode complex H.320 DVC system.
 Connecting a service link will take several seconds. When the
service
 link is connected, it uses MMI, VC and system timeslot resources.
When
 the service link is disconnected it does not tie up any resources.
 The
 Service Link Mode can be administered as either 'as-needed' or
 'permanent' as described below: - As-Needed - Most non-call center
 multimedia users will be administered with this service link mode.
The
 as-needed mode provides the Enhanced multimedia complex with a
 connected service link whenever a multimedia call is answered by the
 station and for a period of 10 seconds after the last multimedia
call
 on the station has been disconnected. Having the service link stay
 connected for 10 seconds allows a user to disconnect a multimedia
call
 and then make another multimedia call without having to wait for the
 service link to disconnect and re-establish. - Permanent -
Multimedia
 call center agents and other users who are constantly making or
 receiving multimedia calls might want to be administered with this
 service link mode. The permanent mode service link will be connected
 during the station's first multimedia call and will remain in a
 connected state until the user disconnects from their PC's
multimedia
 application or the Avaya DEFINITY Server restarts. This provides a
 multimedia user with a much quicker video cut-through when
answering a
 multimedia call from another permanent mode station or a multimedia
call that has been early answered. • Multimedia Mode - There are two
 multimedia modes, Basic and Enhanced, as
 -->
 <xs:element name="serviceLinkMode" maxOccurs="1" minOccurs="0" >
 <xs:simpleType>
 <xs:restriction base="xs:string">
 <xs:enumeration value="as-needed"/>
 <xs:enumeration value="permanent"/>
 </xs:restriction>
 </xs:simpleType>
 </xs:element>

 <!--
 There are two multimedia modes, Basic and Enhanced, as described

```

below:

Basic - A Basic multimedia complex consists of a BRI-connected multimedia-equipped PC and a non-BRI-connected multifunction telephone set. When in Basic mode, users place voice calls at the multifunction telephone and multimedia calls from the multimedia equipped PC. Voice calls will be answered at the multifunction telephone and multimedia calls will alert first at the PC and if unanswered will next alert at the voice station if it is administered with H.320 enabled. A Basic mode complex has limited multimedia feature capability.

Enhanced - An Enhanced multimedia complex consists of a BRI-connected multimedia-equipped PC and a non-BRI-connected multifunction telephone. The Enhanced mode station acts as though the PC were directly connected to the multifunction telephone; the link provides the actual connection between the Avaya DEFINITY and the PC. Thus, voice and multimedia calls are originated and received at the telephone set. Voice and multimedia call status are also displayed at the telephone set. An Enhanced mode station allows multimedia calls to take full advantage of most call control features

Automatic Moves allows a DCP telephone to be unplugged from one
location and moved to a new location without additional
```

Communication Manager administration. Communication Manager automatically associates the extension to the new port.

\*\*\*\*\*CAUTION\*\*\*\*\*  
When a DCP telephone is unplugged and moved to another physical location, the Emergency Location Extension field must be changed for that extension or the USA Automatic Location Identification data base must be manually updated. If the Emergency Location Extension field is not changed or if the USA Automatic Location Identification data base is not updated, the DID number sent to the Public Safety Network could send emergency response personnel to the wrong location.

Valid entries                      Usage  
always                              Enter always and the DCP telephone can be moved anytime without additional administration by unplugging from one location and plugging into a new location.  
once                                Enter once and the DCP telephone can be unplugged and plugged into a new location once. After a move, the field is set to done the next time that routine maintenance runs on the DCP telephone. Use once when moving a large number of DCP telephones so each extension is removed from the move list. Use once to prevent automatic maintenance replacement.  
no                                  Enter no to require administration in order to move the DCP telephone. Done is a display-only value. Communication Manager sets the field to done after the telephone is moved and routine maintenance runs on the DCP telephone.  
error                              Error is a display-only value. Communication Manager sets the field to error, after routine maintenance runs on the DCP telephone, when a non-serialized telephone is set as a movable telephone.

 <!-- Provides extended local calls / imsFeatureSequencing
 Extended Local Calls (ELC) /imsFeatureSequencing allows DCP and H.323
stations to use SIP sequenced applications. The feature works by routing calls
 involving those stations over SIP IMS trunks. In other words, CM is
applying the half-call model to those stations.
 That also has the side effect that features which work differently
under the half-call model than under the usual (full-call) model
 also work differently for ELC stations.
 The Extended Local Calls feature is administrable per station. We're
allowing stations that always use SIP IMS trunks to coexist on
 the same server with stations that dont always use SIP IMS trunks. In
other words, ELC is changing a previous marketing rule that
 the full-call model (CM-ES) and the half-call model (CM-FS) functions
can't co-exist on the same server. As noted above, that also
 has the side effect that features which work differently under the half-
call model than under the full-call model now also can work
 differently for two different SIP stations on the same CM
server.

Client
 Room Class of Service. Note: For stations with an audix station
type, AUDIX Voice Power ports, or ports for any other type of
messaging that needs display information, Display Client Redirection
must be enabled.
 Set true to redirect information for a call originating from a
Client Room and terminating to this station displays.
 -->
 <xs:element name="displayClientRedirection" type="xs:boolean"
maxOccurs="1" minOccurs="0" />

 <!--
 Valid Entries Usage
 true Indicates that a station's line selection is
not to be moved from the currently selected line button
 to a different, non-alerting line button. If
you enter true, the line selection on an on-hook station only moves from the last
 used line button to a line button with an
audibly alerting call. If there are no alerting calls, the line selection

```

```

 remains on the button last used for a call.
 false The line selection on an on-hook station with
no alerting calls can be moved to a different line button, which might be serving a
different
 extension.

 <xs:element name="publicContact" type="tns:xmlPublicContact"/>
 <xs:element name="globalSettings" type="tns:globalSettingsType"/>
 <xs:element name="sharedAddress" type="tns:xmlSharedAddress"/>
 <xs:complexType name="globalSettingsType">
 <xs:annotation>
 <xs:documentation xml:lang="en">

```

```

---Root Element 'presenceSystemDefault' represent a global default that
 defines access to presence if none of the more specific rules apply.
 There must be at least one System Default rule defined.
---Root Element 'presenceEnforcedUserACL' represent collection of
 Enforced User ACL (containing 1 or more Enforced User ACL).This rule
 is similar to a User ACL in the sense that its entries define access
 between individual presentities and watchers. However this rule is
 managed by the administrator as opposed to presentities themselves.
 Entries of Enforced User ACL can also be defined with different
 priorities. Entries with higher priority will have more weight than
 entries with lower priority.
---Root Element 'presenceSystemRule' represent collection of System
 Rules (containing 1 or more System Rules).Global rules that enforce
 certain level of presence access for everyone in the solution. There
 may be several rules that apply to all presentities and all watchers.
 System Rules are used to enforce global policies. For example, a
 system rule can declare that telephony presence should be available
 to everybody in the company. System Rules can be defined with
 different priorities. Rules with higher priority will have more
 weight than rules with lower priority
---Root Element 'presenceSystemACL' represent collection of System ACL
 (containing 1 or more System ACL).
 System ACL (Access Control List) - are enterprise-wide rules that can
 allow a watcher to see presence of all users or deny a watcher from
 accessing anyone's presence. There may be several entries in the
 list, each entry corresponding to one watcher. System ACL is
 normally used to provide critical system services with a privileged
 access to presence of all users.
---Root Element 'publicContact' represent collection of public contacts
 (containing 1 or more public contacts).A personal contact is owned
 by an individual user and is not accessible to all users. A public
 contact can be shared by all users and is owned by the default
 system user.
---Root Element 'sharedAddress' represent collection of shared Address
 (containing 1 or more shared Addresses).A shared Address can be
 shared by all users.
 </xs:documentation>

<xs:complexType name="xmlPublicContact">
 <xs:sequence>
 <xs:annotation>
 <xs:documentation xml:lang="en">
 ---company:The organization that the contact belongs to.
 ---description: A free text field containing human readable
 text providing information on this entry.
 ---displayName:The localized name of a contact to be used when
 displaying. It will typically be the localized full name.
 This value may be provisioned from the user's enterprise
 directory entry. If it does not exist, synchronization
 rules can be used to populate it for other fields
 e.g. Surname, GivenName, or LoginName.
 ---displayNameAscii:The full text name of the contact
 represented in ASCII. It is used to support display
 (e.g. endpoints) that cannot handle localized text.
 ---dn:The distinguished name of the user. The DN is a sequence
 of relative distinguished names (RDN) connected by commas.
 An RDN is an attribute with an associated value in the form
 of attribute=value, normally expressed in a UTF-8 string
 format. The dn can be used to uniquely identify this
 record. Note the dn is changeable.
 ---givenName:The first name of the contact.
 ---initials:Initials of the contact.
 ---middleName:The middle name of the contact.
 ---preferredGivenName:The nick name of the contact.
 ---preferredLanguage:The individual's preferred written or
 spoken language. Values will conform to rfc4646 and the
 reader should refer to rfc4646 for syntax. This format
 uses the ISO standard Language (ISO-639) and region
 (ISO-3166) codes In the absence of a value the client's
 locale should be used, if no value is set, en-US should be

```

```

 defaulted.
 ---source:Free format text field that identifies the entity
 that created this user record. The format of this field
 will be either a IP Address/Port or a name representing an
 enterprise LDAP or Avaya.
 ---sourceUserKey:The key of the user from the source system. If
 the source is an Enterprise Active Directory server, this
 value will be the objectGUID.
 ---suffix:The text appended to a name e.g. Jr., III.
 ---surname:The user's last name, also called the family name.
 ---title:The job function of a person in their organizational
 context.Examples: supervisor, manager.
 ---contactAddresses:A Entity used to store a contact's address.
 ---addresses:A fully qualified URI for interacting with this
 contact. Any addresses added to this entity should contain
 a qualifier e.g. sip, sips, tel, mailto. The address should
 be syntactically valid based on the qualifier. It must be
 possible to add via the GUI and Interface. The application
 must do validation.

<!--
Root Element 'publicContact' represent collection of public contacts
(containing 1 or more public contacts).A personal contact is owned by an
individual user and is not accessible to all users. A public contact can
be shared by all users and is owned by the default system user.
---company:The organization that the contact belongs to.
---description: A free text field containing human readable text providing
information on this entry.
---displayName:The localized name of a contact to be used when displaying.
It will typically be the localized full name. This value may be provisioned
from the user's enterprise directory entry. If it does not exist,
synchronization rules can be used to populate it for other fields
e.g. Surname, GivenName, or LoginName.
---displayNameAscii:The full text name of the contact represented in ASCII. It is
used to support display (e.g. endpoints) that cannot handle localized text.
---dn:The distinguished name of the user. The DN is a sequence of relative
distinguished names (RDN) connected by commas. An RDN is an attribute with
an associated value in the form of attribute=value, normally expressed in a
UTF-8 string format. The dn can be used to uniquely identify this record.
Note the dn is changeable.
---givenName:The first name of the contact.
---initials:Initials of the contact.
---middleName:The middle name of the contact.
---preferredGivenName:The nick name of the contact.
---preferredLanguage:The individual's preferred written or spoken language.
Values will conform to rfc4646 and the reader should refer to rfc4646 for
syntax.
This format uses the ISO standard Language (ISO-639) and region (ISO-3166)
codes In the absence of a value the client's locale should be used, if no
value is set, en-US should be defaulted.
---source:Free format text field that identifies the entity that created this
user record. The format of this field will be either a IP Address/Port or
a name representing an enterprise LDAP or Avaya.
---sourceUserKey:The key of the user from the source system. If the source is
an Enterprise Active Directory server, this value will be the objectGUID.
---suffix:The text appended to a name e.g. Jr., III.
---surname:The user's last name, also called the family name.
---title:The job function of a person in their organizational context.
Examples: supervisor, manager.
---contactAddresses:A table used to store a contact's address.
---addresses:A fully qualified URI for interacting with this contact.
Any addresses added to this table should contain a qualifier
e.g. sip, sips, tel, mailto. The address should be syntactically valid
based on the qualifier. It must be possible to add via the GUI and
Interface. The application must do validation.

| Attribute                | Attribute Description                                                                                                                                                                                                                                                                                                                              | Mandatory/Optional | Validation Constraints |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|------------------------|
| displayName              | The localized name of the user to be used when displaying. Typically, the value is the localized full name. This value might be provisioned from the enterprise directory entry of the user. If the value does not exist, you can use synchronization rules to populate the value for other fields. For example: Surname, GivenName, or LoginName. | Optional           |                        |
| displayNameAscii         | The name that corresponds to the console attribute Endpoint Display Name. The full text name of the user represented in ASCII. The attribute used for displaying (e.g. endpoints) the unsupported localized text.                                                                                                                                  | Optional           |                        |
| dn                       | The distinguished name (DN) of the user. DN is a sequence of relative distinguished names (RDN) connected by commas. RDN is an attribute with an associated value in the form of attribute=value, typically expressed in a UTF-8 string format. Use DN for identifying the user and for authentication subject mapping. You can change DN.         | Optional           |                        |
| isDuplicatedLoginAllowed | A boolean that indicates whether this user is allowed a duplicate concurrent logins. true indicates that the user can have duplicate logins.                                                                                                                                                                                                       | Optional           | Default value is true. |

| Attribute     | Attribute Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Mandatory/Optional | Validation Constraints  |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|-------------------------|
| isEnabled     | A boolean that indicates whether or not the user is active. Users with AuthenticationType=Basic fails if the value is false. This attribute can be used to disable access between login attempts. You cannot revoke login for a running session. Alternatively, the administrator can always modify the password to disable the user from logging in. A true stipulates this is an active user, a false used for a disabled user.                                                                                                                                                                                                                 | Optional           | Default value is false. |
| isVirtualUser | A boolean that indicates whether or not the record is being used for a non-human entity such as an application, service, and software agent. You require this attribute where the entity behaves as a user and needs to have subset of the user profile populated. If the entity does not behave as a user and has a different trust relationship, for example, a trust certificate must not be treated as a virtual user. A virtual user can represent an Avaya or an external non-human entity. This attribute is provided as a convenience to track such accounts. A true stipulates this is a virtual users, a false is used for human users. | Optional           | Default value is false. |
| givenName     | The first name of the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Mandatory          |                         |
| honorific     | The personal title used to address a user. This is typically a social title and not the work title which is contained in the title attribute. This attribute can map to PersonalTitle.                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Optional           |                         |

Table continues...

| Attribute          | Attribute Description                                                                                                                                                                               | Mandatory/Optional | Validation Constraints |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|------------------------|
| loginName          | The unique login name that you provide for the user. The format for the login name is username@domain. The login name is an alphanumeric value and supports the ASCII characters “_”, “.”, and “-”. | Mandatory          |                        |
| middleName         | The middle name of the user.                                                                                                                                                                        | Optional           |                        |
| managerName        | The name of the manager of the user. This is a free formed field and does not require the user's manager to be a user of the solution. The attribute supports the reporting needs.                  | Optional           |                        |
| preferredGivenName | The preferred first name of the user.                                                                                                                                                               | Optional           |                        |

*Table continues...*

| Attribute         | Attribute Description                                                                                                                                                                                                                                             | Mandatory/Optional | Validation Constraints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| preferredLanguage | The preferred written or spoken language. The format uses the ISO standard Language (ISO-639) and region (ISO-3166) codes. If a preferred language is not available, the locale of the client must be used. If the value is blank, en_US must be used as default. | Optional           | <p>The options are:</p> <ul style="list-style-type: none"> <li>English (United States) - en_US</li> <li>Chinese (Simplified) - zh_CN</li> <li>Japanese (Japan) - ja_JP</li> <li>Korean (Korea) - ko_KR</li> <li>French (France) - fr_FR</li> <li>German (Germany) - de_DE</li> <li>Italian (Italy) - it_IT</li> <li>Russian (Russia) - ru_RU</li> <li>English (United Kingdom) - en_GB</li> <li>Spanish (Mexico) - es_MX</li> <li>Portuguese (Brazil) - pt_BR</li> <li>French (Canada) - fr_CA</li> <li>English (Canada) - en_CA</li> </ul> |
| source            | A free format text field that identifies the entity that created this user record. The format of this field must be a IP Address/ Port or a name representing an enterprise LDAP or Avaya.                                                                        | Optional           | User Management populates the source field with the name of the file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| sourceUserKey     | The key of the user from the source system. If the source is an Enterprise Active Directory server, the key is objectGUID.                                                                                                                                        | Optional           | By default, the value is none.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| timeZone  | <p>The preferred time zone of the user. For example: America/New_York, Europe/Dublin. The application consuming this information must know how to translate e.g. in Java it is <code>TimeZone.getTimeZone("Europe/Moscow")</code>; In the absence of a value, the system uses the local services timezone.</p> <p><b>* Note:</b></p> <p>While using the suggested <b>timeZone</b> values, consider daylight saving time (DST) and summer time adjustments. Typically, you add 1 hour to the offset.</p> <p><b>* Note:</b></p> <p>In the import xml files, make the following changes while using specific characters:</p> <ul style="list-style-type: none"> <li>• less-than character (&lt;) as <code>&amp;lt;</code>;</li> <li>• ampersand character (&amp;) as <code>&amp;amp;</code>;</li> <li>• greater-than character (&gt;) as <code>&amp;gt;</code>;</li> <li>• double-quote character (") as <code>&amp;quot;</code>;</li> <li>• apostrophe or single-quote character (') as <code>&amp;apos;</code>;</li> </ul> | Optional           | <p>(-12:0)International Date Line West</p> <p>(-11:0)Midway Island, Samoa</p> <p>(-10:0)Hawaii</p> <p>(-9:0)Alaska</p> <p>(-8:0)Pacific Time (US &amp; Canada); Tijuana</p> <p>(-7:0)Mountain Time (US &amp; Canada); Chihuahua, La Paz</p> <p>(-7:0)Arizona</p> <p>(-6:0)Central Time (US &amp; Canada); Guadalajara, Mexico City</p> <p>(-6:0)Central America; Saskatchewan</p> <p>(-5:0)Indiana (East); Bogota, Lima, Quito</p> <p>(-5:0)Eastern Time (US &amp; Canada)</p> <p>(-4:0)Caracas, La Paz</p> <p>(-4:0)Atlantic Time (Canada); Santiago, Manaus</p> <p>(-3:30)Newfoundland</p> <p>(-3:0)Georgetown</p> <p>(-3:0)Brasilia, Greenland, Buenos Aires, Montevideo</p> <p>(-2:0)Mid-Atlantic</p> <p>(-1:0)Azores</p> <p>(-1:0)Cape Verde Is.</p> <p>(0:0)Monrovia, Reykjavik</p> |

| Attribute         | Attribute Description                                                                                                                                                                                                                                           | Mandatory/Optional | Validation Constraints                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------|
| userPassword      | The encrypted password for this user account. A null password is used when the user is authenticated by the enterprise such as with a separate source such as the enterprise LDAP.                                                                              | Optional           | Need not specified value for Enterprise User. If the value is not specified for the Basic user, the user will be disabled. |
| commPassword      | The encrypted “subscriber” or communication password with which the user logs can use to authentication with on to any CommProfile SIP and non SIP. This attribute is shared across different communication profiles and thus different communication services. | Optional           |                                                                                                                            |
| userType          | The possible primary user application types. A User can be associated with multiple user types.                                                                                                                                                                 | Optional           | The options are administrator, communication_user, agent, supervisor, resident_expert, service_technician, lobby_phone     |
| roles             | The text name of a role. This value must be available in the System Manager database.                                                                                                                                                                           | Optional           |                                                                                                                            |
| address           | The address of the user.                                                                                                                                                                                                                                        | Optional           |                                                                                                                            |
| securityIdentity  | The SecurityIdentity is used to hold any additional identities for a user that can be used for authentication such as loginName, Kerberos account name, or X509 certificate name.                                                                               | Optional           |                                                                                                                            |
| ownedContactLists | It is a collection of internal or external contacts. ContactList is owned by a specific user and has a name that a unique name within the context of its owner.                                                                                                 | Optional           | The system creates a default contactlist per user.                                                                         |

| Attribute             | Attribute Description                                                                                                                                                                                                                                                                                                                                                                                      | Mandatory/Optional | Validation Constraints                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|---------------------------------------|
| ownedContacts         | A non-Avaya application user (external) contact. Contacts can be collected together along with User entities into a contact list. Contacts can be created by an administrator or an end user.                                                                                                                                                                                                              | Optional           |                                       |
| presenceUserDefault   | The personal rules that are set by presentities to define how much presence information can be shown to watchers that are not explicitly mentioned in an ACL. There can be one User Default rule per presentity (User), or none.                                                                                                                                                                           | Optional           |                                       |
| presenceUserACL       | The personal rules defined by presentities themselves on who can monitor their presence information. There might be several entries in the list for a given presentity, each entry corresponding to one watcher.                                                                                                                                                                                           | Optional           |                                       |
| presenceUserCLDefault | The personal rule that is set by presentities to define how much presence information can be shown to watchers that belong to the contact list of the user. There can be one User Contact List Default rule per presentity (Person) or none.                                                                                                                                                               | Optional           |                                       |
| commProfileSet        | The default Commprofile set of the user. A commprofile set can exist without any handles or commprofiles referencing it. That is, you can create a commprofile set without creating a handle or a commprofile. A commprofile set can contain multiple commprofiles, but only one of each specific type. This is enforced by having the CommProfile uniqueness constraint include type, commprofile_set_id. | Optional           | A user has a default commprofile set. |

| Attribute      | Attribute Description                           | Mandatory/Optional | Validation Constraints |
|----------------|-------------------------------------------------|--------------------|------------------------|
| employeeNo     | The employee number of the user.                | Optional           |                        |
| department     | The department which the employee belongs to.   | Optional           |                        |
| organization   | The organization which the employee belongs to. | Optional           |                        |
| localizedNames | The localized name of the user.                 | Optional           |                        |

## Attribute details defined in Delete User XSD

| Attribute  | Attribute description                                                                                                                                                                                                                                                                                                                                                   | Mandatory/Optional | Validation constraints                                                                                |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|-------------------------------------------------------------------------------------------------------|
| deleteType | <p>Defines the delete type of the user. If the user selects:</p> <ul style="list-style-type: none"> <li>• soft: The system does not delete the user record permanently. You can recover the user record.</li> <li>• permanent: The system permanently deletes all attributes associated with the user and the links to public contacts and shared addresses.</li> </ul> | Mandatory          | <p>The options are:</p> <ul style="list-style-type: none"> <li>• soft</li> <li>• permanent</li> </ul> |
| loginName  | A unique system login name assigned to the user in the format username@domain or username.                                                                                                                                                                                                                                                                              | Mandatory          |                                                                                                       |
| id         | A unique identifier for a user record. The id attribute is included in the XSD for future enhancement. This is not used in System Manager the current release.                                                                                                                                                                                                          | Optional           |                                                                                                       |

## Attribute details defined in the CM Endpoint profile XSD

### Attribute details defined in the CM Endpoint profile XSD

| Attribute                                      | Attribute Description                                                                                                                     | Mandatory/Optional | Validation Constraints |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|--------------------|------------------------|
| CM Name<br>cmName                              | The name of the Communication Managementsystem as it appears in the Applications/Application Management/Entities.                         | Mandatory          |                        |
| Use Existing Extension<br>useExistingExtension | Select <b>true</b> if you want to use an already created extension.<br><br>Select <b>false</b> if you want to use an available extension. | Optional           |                        |
| Template Name<br>template                      | The template name that is used to create the endpoint. Values defined in the template will be used if you do not provide other values.    | Optional           |                        |
| Set Type<br>setType                            | The set type of the endpoint.                                                                                                             | Optional           |                        |

*Table continues...*

| Attribute    | Attribute Description | Mandatory/Optional | Validation Constraints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|-----------------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port<br>port | The valid port value. | Optional           | <p>01 to 64 First and second numbers are the cabinet numbers having values A to E. The third character is the carrier having values between 01 to 20. Fourth and fifth characters are the slot number between 01 to 32. Sixth and seventh characters are the circuit number having values x or X.</p> <p>Indicates that there is no hardware associated with the port assignment since the switch was set up, and the administrator expects that the extension has a non-IP set, or that the extension had a non-IP set, and is dissociated. Use x for Administered WithOut Hardware (AWOH) and Computer Telephony (CTI) endpoints, as well as for SBS Extensions.</p> <p>IP Indicates that there is no hardware associated with the port assignment since the switch was set up, and the administrator expects that the extension has an IP set. This is autopopulated for certain IP endpoint set types. You can enter the value for a DCP set with softphone permissions. This changes to the s00000 type when the set registers.</p> |

| Servivable GK Node Name<br>servivableGkNodeName | <p>Servivable GK Node Name identifies the existence of other H.323 gatekeepers located within gateway products that offer survivable call features. For example, the MultiTech MVPxxx-AV H.323 gateway family and the SLS function within the H.248 gateways.</p> <p>When you enter a valid IP node name in this field, Communication Manager adds the IP address of this gateway to the bottom of the Alternate Gatekeeper List for this IP network region. As H.323 IP endpoints register with Communication Manager, this list is sent to the registration confirm message. The IP endpoint can use the IP address of this Survivable Gatekeeper as the call controller of last resort to register with. Survivable GK Node Name is available only if the endpoint is an H.323 endpoint (46xx or 96xx set types).</p> | Optional           | Valid Entry Usage: Valid IP node name, any valid, previously-administered IP node name. |

| Survivable class of restriction<br>survivableCOR | Sets the level of restriction for endpoints to be used with the survivable dial plan to limit certain users to certain types of calls. You can list the restriction levels from the most restrictive to least restrictive. Each level assumes the calling ability of the ones above it. This field is used by the PIM module in Integrated Management to communicate with the Communication Manager administration tables and to obtain the class of service information. PIM module builds a managed database to send to Standard Local Survivability (SLS) on the H.248 gateways. Survivable COR is valid for all analog and IP endpoint types. | Optional           | <p>Valid Entries: Usage emergency - This endpoint can only be used to place emergency calls.</p> <p>Internal - This endpoint can only make intra-switch calls. This is the default value.</p> <p>local - This endpoint can only make calls that are defined as locl, op, svc, or hnpa in the Survivable Gateway Call Controller's routing tables.</p> <p>toll - This endpoint can place any national toll calls that are defined as fnpa or natl on the Survivable Gateway Call Controller's routing tables.</p> <p>unrestricted - This endpoint can place a call to any number defined in the Survivable Gateway Call Controller's routing tables. Those strings marked as deny are also denied to these users.</p> |

| serviceLinkMode | <p>The service link is the combined hardware and software multimedia connection between an Enhanced mode complex's H.320 DVC system and the Avaya DEFINITY Server which ends the H.320 protocol. A service link is never used by a Basic mode complex H.320 DVC system. Connecting a service link will take several seconds. When the service link is connected, it uses MMI, VC and system timeslot resources. When the service link is disconnected it does not tie up any resource. Service Link Mode can be administered as either as-needed or permanent:</p> <ul style="list-style-type: none"> <li>• As- Needed - Most non-call center multimedia users will be administered with this service link mode. The as-needed mode provides the enhanced multimedia complex with a connected service link whenever a multimedia call is answered by the endpoint and for a period of 10 seconds after the last multimedia call on the endpoint has been disconnected. Having the service link stay connected for 10 seconds allows a user</li> </ul> | Optional           | Valid entries: as-needed permanent |

| emergencyLocationExt | <p>This field allows the system to properly identify the location of a caller who dials a 911 emergency call from this endpoint. An entry in this field must be of an extension type included in the dial plan, but does not have to be an extension on the local system. The entry can be a UDP extension.</p> <p>The default entry is blank. A blank entry typically is used for an IP softphone dialing in through PPP from somewhere outside your network. If you populate the IP Address Mapping screen with emergency numbers, the feature functions as follows. If the Emergency Location Extension field in the Endpoint screen is the same as the Emergency Location Extension field in the IP Address Mapping screen, the feature sends the extension to the Public Safety Answering Point (PSAP). If the Emergency Location Extension field in the Endpoint screen is different from the Emergency Location Extension field in the IP Address Mapping screen, the feature sends the extension in the IP Address Mapping screen to the Public</p> | Optional           |                        |

|                       | Safety Answering Point (PSAP).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                    |                        |
| alwaysUse             | A softphone can register no matter what emergency call handling settings the user has entered in the softphone. If a softphone dials 911, the administered Emergency Location Extension is used. The softphone's user-entered settings are ignored. If an IP telephone dials 911, the administered Emergency Location Extension is used. If a call center agent dials 911, the physical endpoint extension is displayed, overriding the administered LoginID for ISDN Display. This does not apply to SCCAN wireless telephones, or to extensions administered as type h.323. | Optional           | Boolean                |
| precedenceCallWaiting | Activates or deactivates Precedence Call Waiting for this endpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Optional           |                        |

| Attribute                   | Attribute Description                                                                                                                                                                                                                                                                                                                                                          | Mandatory/Optional | Validation Constraints |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|------------------------|
| autoSelectAnyIdleAppearance | Enables or disables automatic selection of any idle appearance of transferred or conferenced calls. Communication Manager first attempts to find an idle appearance that has the same extension number as the call being transferred or conferenced has. If that attempt fails, Optional Boolean Communication Manager selects the first idle appearance coverageMsgRetrieval. | Optional           | Boolean                |
| coverageMsgRetrieval        | Allows or denies users in the telephone's Coverage Path to retrieve Leave Word Calling (LWC) messages for this telephone. Applies only if the telephone is enabled for LWC Reception.                                                                                                                                                                                          | Optional           | Boolean                |

| perStationCpnSendCallingNumber | Send Calling Number                                                                                                                                                                                                                                                                                                                                                                                                                           | Optional           | Valid entries:<br><ol style="list-style-type: none"> <li>1. y: All outgoing calls from the endpoint will deliver the Calling Party Number (CPN) information as Presentation Allowed.</li> <li>2. n: No CPN information is sent for the call.</li> <li>3. r: Outgoing non-DCS network calls from the endpoint will deliver the Calling Party Number information as Presentation Restricted.</li> </ol> |
| busyAutoCallbackWithoutFlash   | Appears on the Endpoint screen for analog telephones, only if the Without Flash field in the ANALOG BUSY AUTO CALLBACK section of the Feature-Related System Parameters screen is set to true. The Busy Auto Callback without Flash field then defaults to true for all analog telephones that allow Analog Automatic Callback. Set this field to true to provide automatic callback for a calling analog endpoint without flashing the hook. | Optional           |                                                                                                                                                                                                                                                                                                                                                                                                       |
| audibleMessageWaiting          | Provides audible message waiting                                                                                                                                                                                                                                                                                                                                                                                                              | Optional           | Boolean                                                                                                                                                                                                                                                                                                                                                                                               |

| Messaging System Name<br>messagingName     | The name of Messaging System                                                                                                                       | Mandatory          |                                                                                                                          |
| Use Existing Mailbox number<br>useExisting | true if already created mailbox number is to be used. false if available mailbox number is to be used.                                             | Optional           |                                                                                                                          |
| Messaging Template<br>messagingTemplate    | Specifies the messaging template of a subscriber.                                                                                                  | Optional           |                                                                                                                          |
| Password<br>password                       | Specifies the default password the subscriber must use to log in to his or her mailbox.                                                            | Mandatory          | The password must be from 3 to 15 digits and adhere to system policies that you set on the Avaya Aura® Messaging server. |
| deleteOnUnassign                           |                                                                                                                                                    | Optional           |                                                                                                                          |
| Class of service<br>cos                    | The class of service for this subscriber. The COS controls subscriber access to many features and provides general settings, such as mailbox size. | Optional           | Valid ranges from 0 to 995                                                                                               |

*Table continues...*

| Attribute                   | Attribute Description                                                                                                                                                                                                                                                                                                               | Mandatory/Optional | Validation Constraints                                  |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|---------------------------------------------------------|
| Community ID<br>communityID | Specifies the default community ID for the subscriber. Community IDs are used to control message sending and receiving among groups of subscribers.                                                                                                                                                                                 | Optional           | The default value is 1.                                 |
| Email Handle<br>emailHandle | Specifies the name that appears before the machine name and domain in the subscriber's e-mail address. The machine name and domain are automatically added to the handle you enter when the subscriber sends or receives an e-mail.                                                                                                 | Optional           |                                                         |
| Common Name<br>commonName   | Specifies the display name of the subscriber in address book listings, such as those for e-mail client applications.                                                                                                                                                                                                                | Optional           | The name you enter can be 1 to 64 characters in length. |
| secondaryExtension          | Specifies one or more alternate number to reach a subscriber. You can use secondary extensions to specify a telephone number for direct reception of faxes, to allow callers to use an existing Caller Application, or to identify each line appearance on the subscriber's telephone set if they have different telephone numbers. | Optional           | Valid values 0 to 9<br>number values of length 10       |

| <b>Select check box</b> | Use this check box to select a job.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Scheduled Time</b>   | The time and date of scheduling the job.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Status</b>           | The current status of the job. The following are the different status of a job: <ol style="list-style-type: none"> <li>1. PENDING EXECUTION: The job is in queue.</li> <li>2. RUNNING: The job execution is in progress.</li> <li>3. SUCCESSFUL: The job execution is completed.</li> <li>4. INTERRUPTED: The job execution is cancelled.</li> <li>5. PARTIAL FAILURE: The job execution has partially failed.</li> <li>6. FAILED: The job execution has failed.</li> </ol> |
| <b>Job Name</b>         | A link to the Scheduler user interface. You can also cancel the job from the Scheduler user interface.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>% Complete</b>       | The job completion status in percentage.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>User Records</b>     | The total user records in the input file.                                                                                                                                                                                                                                                                                                                                                                                                                                   |

*Table continues...*

| Name            | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| <b>Warnings</b> | The number of user records in the input file with warnings.         |
| <b>Errors</b>   | The number of user records in the input file that failed to import. |

| Button              | Description                                                                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View Job</b>     | Displays the details of the selected job.                                                                                                                                                  |
| <b>Cancel Job</b>   | Cancels the import operation for the selected job. You can cancel a job that is in progress or queued for import.                                                                          |
| <b>Delete Job</b>   | Deletes the selected job.                                                                                                                                                                  |
| <b>Refresh</b>      | Refreshes the job information in the table.                                                                                                                                                |
| <b>Show</b>         | Provides you an option to view all the jobs on the same page. If the table displaying scheduled jobs are spanning multiple pages, select <b>All</b> to view all the jobs on a single page. |
| <b>Select: All</b>  | Selects all the jobs in the table.                                                                                                                                                         |
| <b>Select: None</b> | Clears the check box selections.                                                                                                                                                           |
| <b>Previous</b>     | Displays jobs in the previous page.                                                                                                                                                        |
| <b>Next</b>         | Displays jobs in the next page.                                                                                                                                                            |
| <b>Done</b>         | Navigates to the <b>User Management</b> page.                                                                                                                                              |

## Import Users – Job Details field descriptions

The Import Users-Job Details page displays the details of the selected job.

| Name                       | Description                                                                                                                                                                                              |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>                | The import job that the end user initiates.                                                                                                                                                              |
| <b>Scheduled by</b>        | The name of the user who initiates or schedules the import job                                                                                                                                           |
| <b>Scheduled at</b>        | The start time of the import job.                                                                                                                                                                        |
| <b>Error Configuration</b> | The value that was configured for error while scheduling the Import Job. The values are <b>Abort on first error</b> and <b>Continue processing other records</b> .                                       |
| <b>Import Type</b>         | The value configured for the <b>Import Type</b> field while scheduling the import job. The values are <b>Complete</b> and <b>Partial</b> .                                                               |
| <b>Import Option</b>       | The value that was configured for the <b>If a matching record already exists</b> field while scheduling the import job. The values are <b>Skip</b> , <b>Merge</b> , <b>Replace</b> , and <b>Delete</b> . |
| <b>End</b>                 | The end date and time of the job.                                                                                                                                                                        |
| <b>Status</b>              | The status of the job.                                                                                                                                                                                   |
| <b>File</b>                | The name of the file that is used to import the user records.                                                                                                                                            |
| <b>Count</b>               | The total number of user records in the input file.                                                                                                                                                      |
| <b>Success</b>             | The total number of user records that are successfully imported.                                                                                                                                         |

*Table continues...*

| Name             | Description                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Fail</b>      | The total number of user records that failed to import.                                                                  |
| <b>Warning</b>   | The total number of user records that successfully imported, however, there are warnings generated for the user records. |
| <b>Message</b>   | A message that indicates whether the import is successful or failure.                                                    |
| <b>Completed</b> | The percentage completion of the import.                                                                                 |

| Name                 | Description                                                   |
|----------------------|---------------------------------------------------------------|
| <b>Line Number</b>   | The line number in the file where the error occurred.         |
| <b>Login Name</b>    | The login name of the user record that failed to be imported. |
| <b>Error Message</b> | A brief description of the error.                             |

| Button          | Description                                                                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Download</b> | Exports and saves the user import error records in an XML file to the specified destination.<br><br> <b>Note:</b><br>This button is not available if there are no error records for user Import Jobs or if the import job type is set to <b>Abort on first error</b> . |
| <b>Cancel</b>   | Returns to the Import Users page.                                                                                                                                                                                                                                                                                                                       |

To enable the **Download** button, on the User bulk import configuration page, set the **Enable Error File Generation** attribute to **True**.

To navigate to the User bulk import configuration page from the System Manager console, click **Services > Configurations > Settings > SMGR > User BulkImport profile**.

## Import Global Settings field descriptions

Use this page to bulk import shared addresses, public contacts, and presence access control list (ACLs) from a valid XML file. These imported items are also called global user settings.

### File Selection

| Name               | Description                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select File</b> | The path and name of the XML file from which you must import the global settings records.<br><br>If a file type does not match, System Manager displays an error message. |

| Button        | Description                                                                                |
|---------------|--------------------------------------------------------------------------------------------|
| <b>Browse</b> | Opens a dialog box to select the file from which you must import the global user settings. |

## General

| Name                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Error Configuration</b>          | <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Abort on first error:</b> Stops importing the global user settings records when User Management encounters the first error in the import file containing the global user settings records.</li> <li>• <b>Continue processing other records:</b> Imports the next global user settings record even if User Management encounters an error while importing a global user settings record.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>If a matching record already exists</b> | <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Skip:</b> Skips a matching global user settings record that already exists in the system database during an import operation. Currently, using this option you can add a new public contact to a public contact set but you cannot update an existing public contact in a public contact set.</li> <li>• <b>Merge:</b> Imports the global user settings data at an even greater degree of granularity. For example, add a shared address to a shared address list or update a public contact.</li> <li>• <b>Replace:</b> Re-imports or replaces all the global user setting records in the import file. This is essentially the ability to replace a user along with the other data related to the global user settings.</li> <li>• <b>Delete:</b> Deletes the global setting records from the database that matches the records in the input XML file.</li> </ul> |

## Job Schedule

| Name                | Description                                                                                                                                                                                                                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Schedule Job</b> | <p>The settings for configuring the schedule of the job:</p> <ul style="list-style-type: none"> <li>• <b>Run immediately:</b> Use this option to run the import job immediately.</li> <li>• <b>Schedule later:</b> Use this option to run the job at the specified date and time.</li> </ul> |
| <b>Date</b>         | <p>The date when you must run the import job. The date format is mm dd yyyy. You can use the calendar icon to choose a date.</p> <p>This field is available when you select the <b>Schedule later</b> option for scheduling a job.</p>                                                       |
| <b>Time</b>         | <p>The time of running the import job. The time format is hh:mm:ss and 12 (AM or PM) or 24-hour format.</p> <p>This field is available when you select the <b>Schedule later</b> option for scheduling a job.</p>                                                                            |
| <b>Time Zone</b>    | <p>The time zone of your region.</p> <p>This field is available when you select the <b>Schedule later</b> option for scheduling a job.</p>                                                                                                                                                   |

| Button        | Description                                                                 |
|---------------|-----------------------------------------------------------------------------|
| <b>Import</b> | Imports or schedules the import operation based on the option you selected. |

## Manage Jobs

| Name                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select check box</b> | Use this check box to select a job.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Scheduled Time</b>   | The date and time when the job was scheduled.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Status</b>           | The current status of the job. The following are the different status of a job: <ol style="list-style-type: none"> <li>1. PENDING EXECUTION: The job is in queue.</li> <li>2. RUNNING: The job execution is in progress.</li> <li>3. SUCCESSFUL: The job execution is completed.</li> <li>4. INTERRUPTED: The job execution is cancelled.</li> <li>5. PARTIAL FAILURE: The job execution has partially failed.</li> <li>6. FAILED: The job execution has failed.</li> </ol> |
| <b>Job Name</b>         | A link to the Scheduler user interface. You can also cancel the job from the Scheduler user interface.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>% Complete</b>       | The job completion status in percentage.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Records</b>          | The total number of global user settings records in the input file.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Error</b>            | The number of global user settings records in the input file that failed to import.                                                                                                                                                                                                                                                                                                                                                                                         |

| Button              | Description                                                                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View Job</b>     | Shows the details of the selected job.                                                                                                                                                     |
| <b>Cancel Job</b>   | Cancels the import operation for the selected job. You can cancel a job that is in progress or queued for import.                                                                          |
| <b>Delete Job</b>   | Deletes the selected job.                                                                                                                                                                  |
| <b>Refresh</b>      | Refreshes the job information in the table.                                                                                                                                                |
| <b>Show</b>         | Provides you an option to view all the jobs on the same page. If the table displaying scheduled jobs are spanning multiple pages, select <b>All</b> to view all the jobs on a single page. |
| <b>Select: All</b>  | Selects all the jobs in the table.                                                                                                                                                         |
| <b>Select: None</b> | Clears the check box selections.                                                                                                                                                           |
| <b>Previous</b>     | Displays jobs in the previous page.                                                                                                                                                        |
| <b>Next</b>         | Displays jobs in the next page.                                                                                                                                                            |
| <b>Done</b>         | Returns to the <b>User Management</b> page.                                                                                                                                                |
| <b>Cancel</b>       | Cancels the import operation and returns to the User Management page.                                                                                                                      |

## Job Details field descriptions

The Job Details page displays the details of the selected Job.

| Name                | Description                                                                  |
|---------------------|------------------------------------------------------------------------------|
| <b>Name</b>         | Specifies the name of the import job.                                        |
| <b>Scheduled by</b> | Name of the user who initiated or scheduled the import job.                  |
| <b>Scheduled at</b> | Start time of the scheduled job.                                             |
| <b>End</b>          | End date and time of the job.                                                |
| <b>Status</b>       | Status of the job.                                                           |
| <b>File</b>         | Name of the file that is used to import the global user settings records.    |
| <b>Count</b>        | Total number of global user settings records in the input file.              |
| <b>Success</b>      | Total number of global user settings records that are successfully imported. |
| <b>Fail</b>         | Total number of global user settings records that failed to import.          |
| <b>Message</b>      | The message that indicates whether the import is successful or failure.      |
| <b>Completed</b>    | Displays the percentage completion of the import.                            |

| Name                 | Description                               |
|----------------------|-------------------------------------------|
| <b>Record Number</b> | Failed XML element in the input XML file. |
| <b>Name</b>          | Name of the failed XML element.           |
| <b>Error Message</b> | A brief description of the error.         |

| Button        | Description                       |
|---------------|-----------------------------------|
| <b>Cancel</b> | Returns to the Import Users page. |

## Quick start to importing users

### Quick start to importing users

This section describes how to quickly create an XML file for importing users in bulk. This XML file includes user profiles with core attributes as well as with SIP phone (SIP communication profile).

### XML for user with core attributes

The table lists the minimal elements for mapping the user import XML with user interface fields.

**Table 3: Minimal elements**

| UI field                   | Description                                              | XML tag                                                                    | Possible value              |
|----------------------------|----------------------------------------------------------|----------------------------------------------------------------------------|-----------------------------|
| <b>Authentication Type</b> | Specifies the type of authentication.                    | <pre>&lt;authenticationType&gt; ... &lt;/authenticationType&gt; &gt;</pre> | Basic or Enterprise         |
| <b>First Name</b>          | Specifies the first name of the user.                    | <pre>&lt;givenName&gt; ... &lt;/givenName&gt;</pre>                        | First name of the user.     |
| <b>Login Name</b>          | Specifies the primary handle of user.                    | <pre>&lt;loginName&gt; ... &lt;/loginName&gt;</pre>                        | User log-in name.           |
| <b>Last Name</b>           | Specifies the last name of the user.                     | <pre>&lt;surname&gt; ... &lt;/surname&gt;</pre>                            | Last name of the user.      |
| <b>Login Password</b>      | Specifies the password used to log in to System Manager. | <pre>&lt;userPassword&gt; ... &lt;/userPassword&gt;</pre>                  | Login password of the user. |

### Sample XML with a single user profile

The following sample XML contains a user profile with basic fields. To create your own XML, replace the value of the tags explained in the Minimal elements table in *XML for user with core attributes*.

```
<?xml version="1.0" encoding="UTF-8"?>
 <!-- Root Element 'Users' represent collection of user (containing 1 or more users)-->
 <tns:users xmlns:tns="http://xml.avaya.com/schema/import" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation="http://xml.avaya.com/schema/import userimport.xsd" >

 <tns:user>
 <authenticationType>Basic</authenticationType>
 <givenName>John</givenName>
 <loginName>jmiller@avaya.com</loginName>
 <surname>Miller</surname>
 <userPassword>mypassword</userPassword>
 </tns:user>
 </tns:users>
```

The highlighted XML tag in the user profile XML represents the data for a single user tag that starts and ends with `</tns:user>`. To create multiple users in the same XML, repeat the highlighted content multiple times with different user values.

For example, the following sample XML contains two users, John Miller and Roger Philip. Note that there are two instances of the `<tns:user>` tag, one for each user.

```
<?xml version="1.0" encoding="UTF-8"?>
 <!-- Root Element 'Users' represent collection of user (containing 1 or more
```

```

users)-->
<tns:users xmlns:tns="http://xml.avaya.com/schema/import" xmlns:xsi="http://www.w3.org/
2001/XMLSchema-instance" xsi:schemaLocation="http://xml.avaya.com/schema/import
userimport.xsd" >

 <tns:user>
 <authentication>TypeBasic</authenticationType>
 <givenName>John</givenName>
 <loginName>jmiller@avaya.com</loginName>
 <surname>Miller</surname>
 <userPassword>mypassword</userPassword>
 </tns:user>

 <tns:user>
 <authenticationType>Basic</authenticationType>
 <givenName>Roger</givenName>
 <loginName>rphilip@avaya.com</loginName>
 <surname>Philip</surname>
 <userPassword>mypassword</userPassword>
 </tns:user>

</tns:users>

```

 **Note:**

The XML is a text file. Therefore, you can edit this XML in any text editor.

## Bulk import XML for users with SIP phone

To create a user XML, first perform the procedure for bulk importing users in the *Bulk importing users* section. If communication address is added to the user, then the **commPassword** field is mandatory.

To assign communication address, the mapping of Communication Profile for a new SIP user is as follows:

**Table 4: Mapping of Communication Profile for a new SIP user**

| UI field       | Description                                      | XML tag                                                                 | Possible value                                 |
|----------------|--------------------------------------------------|-------------------------------------------------------------------------|------------------------------------------------|
| <b>Name</b>    | Specifies the name of the communication profile. | <pre> &lt;commProfileSetName&gt; ... &lt;/commProfileSetName&gt; </pre> | The unique name of this communication profile. |
| <b>Default</b> | Indicates whether this is a default profile.     | <pre> &lt;isPrimary&gt; ... &lt;/isPrimary&gt; </pre>                   | True or False.                                 |

The attributes to set up the communication address for a user are as follows:

**Table 5: User attributes to set up communication address**

| UI field       | Description                                              | XML tag                                                     | Possible value                                                  |
|----------------|----------------------------------------------------------|-------------------------------------------------------------|-----------------------------------------------------------------|
| <b>Handle</b>  | Specifies the extension number of the user.              | <pre>&lt;handleName&gt; ... &lt;/handleName&gt;</pre>       | Extension number.                                               |
| <b>Type</b>    | Specifies the communication type of the user profile.    | <pre>&lt;handleType&gt; ... &lt;/handleType&gt;</pre>       | Communication type. For example, sip and smtp.                  |
| <b>SubType</b> | Specifies the communication subtype of the user profile. | <pre>&lt;handleSubType&gt; ... &lt;/handleSubType&gt;</pre> | Communication sub type. For example, username, e164, and msrtc. |
| <b>Domain</b>  | Specifies the domain name of the user.                   | <pre>&lt;domainName&gt; ... &lt;/domainName&gt;</pre>       | Name of the configured SIP domain name.                         |

The following is the mapping of Session Manager Communication profile elements with the corresponding user interface fields.

**Table 6: Mapping of Session Manager Communication Profile elements**

| UI field                                          | Description                                                                                                             | XML tag                                                                                                      | Possible value                     |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|------------------------------------|
| <b>Primary Session Manager</b>                    | Specifies the name of the primary Session Manager instance that is used as the home server for a communication profile. | <pre>&lt;sm:primarySM&gt; ... &lt;/sm:primarySM&gt;</pre>                                                    | Enter the name of Session Manager. |
| <b>Origination Application Sequence</b>           | Specifies the Application Sequence that is invoked when calls are routed from this user.                                | <pre>&lt;sm:originationAppSequence&gt; ... &lt;/sm:originationAppSequence&gt;</pre>                          | True or False.                     |
| <b>Termination Application Sequence</b>           | Specifies the Application Sequence that is invoked when calls are routed to this user.                                  | <pre>&lt;sm:terminationAppSequence&gt; ... &lt;/sm:terminationAppSequence&gt;</pre>                          |                                    |
| <b>Emergency Origination Application Sequence</b> | Specifies the emergency application sequence that is invoked when calls are routed from this user.                      | <pre>&lt;ns6:emergencyOriginationAppSequence&gt;app edpseq&lt;/ns6:emergencyOriginationAppSequence&gt;</pre> |                                    |

*Table continues...*

| UI field                                          | Description                                                                                      | XML tag                                                                                                                 | Possible value |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|----------------|
| <b>Emergency Termination Application Sequence</b> | Specifies the emergency application sequence that is invoked when calls are routed to this user. | <code>&lt;ns6:emergencyTerminationAppSequence&gt;app<br/>edpseq&lt;/<br/>ns6:emergencyTerminationAppSequence&gt;</code> |                |
| <b>Home Location</b>                              | Specifies the routing home location.                                                             | <code>&lt;sm:homeLocation&gt;<br/>...<br/>&lt;/sm:homeLocation&gt;</code>                                               |                |

The following is the mapping of CM Endpoint Profile elements with the corresponding user interface fields.

**Table 7: Mapping of CM Endpoint Profile elements**

| UI field            | Description                                                          | XML tag                                                                                     | Possible value                                |
|---------------------|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------|-----------------------------------------------|
| <b>System</b>       | Specifies the SIP Entity of the Communication Manager.               | <code>&lt;ipt:cmName&gt;<br/>...<br/>&lt;/ipt:cmName&gt;</code>                             | Name of the configured Communication Manager. |
| <b>Use Existing</b> | Indicates whether the station is already defined in the system.      | <code>&lt;ipt:useExistingExtension&gt;<br/>...<br/>&lt;/ipt:useExistingExtension&gt;</code> | True or False.                                |
| <b>Extension</b>    | Specifies the extension number for this profile.                     | <code>&lt;ipt:extension&gt;<br/>...<br/>&lt;/ipt:extension&gt;</code>                       |                                               |
| <b>Template</b>     | Specifies the template name used for creating the station.           | <code>&lt;ipt:template&gt;<br/>...<br/>&lt;/ipt:template&gt;</code>                         |                                               |
| <b>Set Type</b>     | Specifies the set type of the station.                               | <code>&lt;ipt:setType&gt;<br/>...<br/>&lt;/ipt:setType&gt;</code>                           |                                               |
| <b>Port</b>         | Specifies the port number from the list for the template you select. | <code>&lt;ipt:port&gt;<br/>...<br/>&lt;/ipt:port&gt;</code>                                 |                                               |

## Sample XML file for a user with SIP Communication Profile

Here is the sample XML of a user profile with basic fields. To create your own XML, replace the value of the tags explained in the Mapping of CM Endpoint Profile elements table in *Bulk import XML for users with SIP phone*.

```
<?xml version="1.0" encoding="UTF-8"?>
 <!-- Root Element 'Users' represent collection of user (containing 1 or more
users)--
tns:users xmlns:tns="http://xml.avaya.com/schema/import" xmlns:xsi="http://www.w3.org/
2001/XMLSchema-instance" xsi:schemaLocation="http://xml.avaya.com/schema/import
userimport.xsd" >
 <tns:user>
 <authenticationType>BASIC</authenticationType>
 <givenName>John</givenName>
 <loginName>jmiller@avaya.com</loginName>
 <surname>Miller</surname>
 <userPassword>mypassword</userPassword>
 <commPassword>12345</commPassword>
 <commProfileSet>
 <commProfileSetName>Primary</commProfileSetName>
 <isPrimary>true</isPrimary>
 <handleList>
 <handle>
 <handleName>sip:jmiller@avaya.com</handleName>
 <handleType>sip</handleType>
 <handleSubType>msrtc</handleSubType>
 </handle>
 </handleList>
 <!--The below is extended communication profile-->
 <commProfileList>
 <commProfile xsi:type="sm:SessionManagerCommProfXML" xmlns:sm="http://
xml.avaya.com/schema/import_sessionmanager">

# Managing public contacts

---

## Manage public contact list

An administrator defines public contacts for the users in System Manager. You can share the public contacts with all the users in System Manager.

A user with administrator permission can add, modify, and delete a public contact. While creating a public contact, you need to specify the details of contact that also includes the postal address and communication address of the public contact.

The public contacts defined in the system are the default public contacts for the users and access control list.

---

## Adding a new public contact

### Procedure

1. On the System Manager web console, click **Users > User Management > Public Contacts**.
2. On the Public Contacts page, click **New**.
3. On the New Public Contact page, in the **Contact Details** area, enter the appropriate information in the respective fields.

Enter valid information in these fields to successfully create a new public contact.

The localized display name must be a unique name. If you do not enter any information in the **Localized Display Name** field, the system automatically generates a localized display name for the public contact.

4. In the **Postal Address** area, click **New** to add postal address of the contact.
5. In the **Contact Address** area, click **New** to add contact address.

A contact address can be a phone number or any communication address that is supported by the application.

6. Click **Commit** to create a new public contact.

### Related links

[New Public Contact field descriptions](#) on page 601

---

## Modifying details of a public contact

### Procedure

1. On the System Manager web console, click **Users > User Management > Public Contacts**.
2. On the Public Contacts page, click **Edit**.
3. On the Edit Public Contact page, modify the information of the contact.
4. Click **Commit**.

 **Note:**

Before you click **Commit**, ensure that you entered valid information in the mandatory fields.

### Related links

[Edit Public Contact field descriptions](#) on page 599

---

## Deleting public contacts

### Procedure

1. On the System Manager web console, click **Users > User Management > Public Contacts**.
2. On the Public Contacts page, select one or more contacts.
3. Click **Delete**.
4. On the Contact Delete Confirmation page, click **Delete**.

The system deletes the contact from the default contact list of the user if the public contact is associated with the user.

---

## Viewing the details of a public contact

### Procedure

1. On the System Manager web console, click **Users > User Management > Public Contacts**.
2. On the Public Contacts page, select a public contact and click **View**.

The View Public Contact page displays the details of a public contact.

### Contact Details

| Name                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last Name</b>                      | The last name of the contact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Last Name (Latin Translation)</b>  | <p>The user-preferred last name that the system must display on the endpoints. For example, Miller.</p> <p>Typically, the name is in the written or spoken language of the user.</p> <p> <b>Note:</b></p> <p>When you create a user, if the <b>Last Name (Latin Translation)</b> and <b>First Name (Latin Translation)</b> fields are:</p> <ul style="list-style-type: none"> <li>• Blank, the system displays the last name and first name in the fields. The values change when the last and first names change.</li> <li>• Filled, the values remain the same even after you change the values in the <b>Last Name</b> and <b>First Name</b> fields.</li> </ul> |
| <b>First Name</b>                     | The first name of the contact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>First Name (Latin Translation)</b> | <p>The user-preferred first name that the system must display on the endpoints. For example, John.</p> <p>Typically, the name is in the written or spoken language of the user.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Middle Name</b>                    | The middle name of the contact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>                    | Displays a brief description about the contact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Company</b>                        | The name of contact's company.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Localized Display Name</b>         | The localized display name of a user. It is typically the localized full name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Endpoint Display Name</b>          | The endpoint display name of the contact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Language Preference</b>            | Displays a list of languages from which you set one language as the preferred language for the contact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Update Time</b>                    | The time when the contact information was last updated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Source</b>                         | The source for provisioning the contact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Postal Address

| Name                | Description                                              |
|---------------------|----------------------------------------------------------|
| <b>Name</b>         | The name of the contact.                                 |
| <b>Address Type</b> | The mailing address type such as home or office address. |
| <b>Street</b>       | The name of the street.                                  |
| <b>City</b>         | The name of the city or town.                            |
| <b>Postal Code</b>  | The name of the contact's company.                       |
| <b>Province</b>     | The full name of the contact's province.                 |
| <b>Country</b>      | The name of the contact's country.                       |

| Button                       | Description                                                                                                     |
|------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Edit</b>                  | Displays the <b>Edit Address</b> page. Use this page to add a new postal address of the public contact.         |
| <b>New</b>                   | Displays the <b>Add Address</b> page. Use this page to modify an existing postal address of the public contact. |
| <b>Delete</b>                | Deletes the selected public contacts.                                                                           |
| <b>Choose Shared Address</b> | Displays the <b>Choose Address</b> page. Use this page to choose addresses of the public contact.               |

## Contact Address

| Name                     | Description                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Address</b>           | The address that you can use to communicate with the contact. This can be a phone number, e-mail address, or IM of the contact.                     |
| <b>Type</b>              | The type of communication medium for interacting with the user.                                                                                     |
| <b>Category</b>          | The categorization of the address based on the location.                                                                                            |
| <b>Label</b>             | Displays a text description for classifying this contact.                                                                                           |
| <b>Alternative Label</b> | Displays a text description for classifying this contact. This is similar to <b>Label</b> , but it is used to store label in an alternate language. |

| Button        | Description                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------|
| <b>Edit</b>   | Displays the <b>Edit Address</b> page. Use this page to edit a contact address of the public contact. |
| <b>New</b>    | Displays the <b>Add Address</b> page. Use this page to add a contact address of the public contact.   |
| <b>Delete</b> | Deletes the selected public contacts.                                                                 |

| Button        | Description                                     |
|---------------|-------------------------------------------------|
| <b>Commit</b> | Saves the modified information to the database. |

| <b>Delete</b>                | Deletes the selected public contacts.                                                                           |
| <b>Choose Shared Address</b> | Displays the <b>Choose Address</b> page. Use this page to choose addresses of the public contact.               |

## Contact Address

| Name                     | Description                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Address</b>           | The address that you can use to communicate with the contact. This can be a phone number, e-mail address, or IM of the contact.                     |
| <b>Type</b>              | The type of communication medium for interacting with the user.                                                                                     |
| <b>Category</b>          | The categorization of the address based on the location.                                                                                            |
| <b>Label</b>             | Displays a text description for classifying this contact.                                                                                           |
| <b>Alternative Label</b> | Displays a text description for classifying this contact. This is similar to <b>Label</b> , but it is used to store label in an alternate language. |

| Button        | Description                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------|
| <b>Edit</b>   | Displays the <b>Edit Address</b> page. Use this page to edit a contact address of the public contact. |
| <b>New</b>    | Displays the <b>Add Address</b> page. Use this page to add a contact address of the public contact.   |
| <b>Delete</b> | Deletes the selected public contacts.                                                                 |

| Button        | Description                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Commit</b> | <p>Creates a new contact.</p> <p> <b>Note:</b></p> <p>Enter valid information in the mandatory fields to successfully create a new contact.</p> |

| <b>Filter: Enable</b>          | Displays text fields under the columns that you can use to set the filter criteria. This is a toggle button.    |
| <b>Filter: Apply</b>           | Filters contacts based on the filter criteria.                                                                  |

## Criteria section

The page displays the following fields when you click **Advanced Search** . You can find the **Advanced Search** link at the upper-right corner of the public contact table.

| Name            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Criteria</b> | <p>Displays the following three fields:</p> <ul style="list-style-type: none"> <li>Field 1– The list of criteria that you can use to search public contacts. The options are: <ol style="list-style-type: none"> <li>1. Last Name: Searches public contacts by last name.</li> <li>2. First Name: Searches public contacts by first name.</li> <li>3. Display Name: Searches public contacts by display name.</li> <li>4. Contact Address: Searches public contacts by contact address.</li> </ol> </li> <li>Field 2 – The operator for evaluating the expression. The list of operators displayed depends on the type of criterion that you selected in field 1.</li> <li>Field 3 – The search value for the search criterion selected in field 1.</li> </ul> |

---

## Managing shared addresses

---

### Manage shared address

Shared address contains common addresses that you can specify for one or more users in the enterprise. The user with appropriate permissions can create a new shared address and modify and delete an existing shared address. For example, you can add the address of the company in the list of shared address and other users can use this address as their alternative address.

---

### Assigning a shared address to the user

#### About this task

Use this procedure to choose a shared address for a user from the common addresses database. You can assign and remove a shared address.

#### Procedure

1. On the System Manager web console, click **Users > User Management > Manage Users**.
2. On the Manage Users page, do one of the following:
  - To assign shared addresses to a new user while creating the user, click **New**.
  - To assign shared addresses to an existing user, select the user, and click **Edit**.
3. On the User Profile | Add page or the User Profile | Edit | <User Name> page, click **Identity > Address > Choose Shared Address**.
4. On the Choose Shared Address page, click one or more shared addresses.

For a new user, enter valid information in all mandatory fields on all tabs of the User Profile | Add page before you click **Commit**. If you enter invalid information, the system displays an error message.

5. Click **Select**.
6. Click one of the following:
  - **Commit**: To save the changes.
  - **Commit & Continue**: To save the changes and stay on the same page for making further modifications.

---

## Adding a shared address

### Procedure

1. On the System Manager web console, click **Users > User Management > Shared Addresses**.
2. On the Shared Address page, click **New**.
3. On the Add Address page, enter the appropriate information.
4. Click **Add**.

### Result

The new address is available as shared address and you can specify this address when you create or modify a user account.

---

## Modifying a shared address

### Procedure

1. On the System Manager web console, click **Users > User Management > Shared Addresses**.
2. On the Shared Address page, select an address and click **Edit**.
3. On the Edit Address page, modify the information in the fields.
4. Click **Add**.

---

## Deleting a shared address

### About this task

You can use this feature to delete a shared address. You cannot delete a shared address if the address is associated with one or more users.

### Procedure

1. On the System Manager web console, click **Users > User Management > Shared Addresses**.
2. On the Shared Address page, select the address you want to delete and click **Delete**.

---

## Add Address field descriptions

| Name                     | Description                                                                                                                      |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Address Name</b>      | The unique label that identifies the mailing address.                                                                            |
| <b>Address Type</b>      | The mailing address type such as home or office address.                                                                         |
| <b>Building</b>          | The name of the building.                                                                                                        |
| <b>Room</b>              | The number or name of the room.                                                                                                  |
| <b>Street</b>            | The name of the street.                                                                                                          |
| <b>City</b>              | The name of the city or town.                                                                                                    |
| <b>State or Province</b> | The full name of the province.                                                                                                   |
| <b>Postal Code</b>       | The postal code or zip code used by postal services to route mail to a destination. For the United States, specify the Zip code. |
| <b>Country</b>           | The name of the country.                                                                                                         |

### Phone Details section

| Name                        | Description                                                                    |
|-----------------------------|--------------------------------------------------------------------------------|
| <b>Business Phone</b>       | The business phone number of the user.                                         |
| <b>Other Business Phone</b> | The secondary or alternate business phone number if applicable.                |
| <b>Home Phone</b>           | The residential phone number of the user.                                      |
| <b>Other Home Phone</b>     | The secondary or alternate residential phone number if applicable.             |
| <b>Mobile Phone</b>         | The mobile number of the user.                                                 |
| <b>Other Mobile Phone</b>   | The secondary or alternate mobile number of the user if applicable.            |
| <b>Fax</b>                  | The telephone number for direct reception of faxes.                            |
| <b>Pager</b>                | The number used to make calls to the pager of the user.                        |
| <b>Other Pager</b>          | The secondary or alternate number used to make calls to the pager of the user. |

| Button        | Description                           |
|---------------|---------------------------------------|
| <b>Add</b>    | Adds the mailing address of the user. |
| <b>Cancel</b> | Cancels the add address operation.    |

## Managing presence access control lists

---

### Manage Presence Access Control Lists

Default Policy rules are global default rules that define access to presence information if none of the more specific rules apply. You must define atleast one System Default rule in the system.

#### Define Policy

You can use this section to define your personal rules for one or more watchers to access your presence information.

| Name                    | Description                                                      |
|-------------------------|------------------------------------------------------------------|
| <b>Select check box</b> | The option to select a rule.                                     |
| <b>Access Level</b>     | The presence information for which access control rules are set. |
| <b>Action</b>           | The access control permission for the presence information.      |

| Button        | Description                                                                   |
|---------------|-------------------------------------------------------------------------------|
| <b>Edit</b>   | Changes the existing rule.                                                    |
| <b>New</b>    | Adds a new rule for watchers.                                                 |
| <b>Delete</b> | Deletes the selected rule from the list of rules that are added for watchers. |

The page displays the following fields when you click **New** or **Edit**:

| Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Communication profile password policy enforcement

---

### Communication profile password policy

The system administrator defines a password strength policy for the communication profile password. The password has the following requirements:

- Passwords must contain 6 to 25 characters. The default value is 14.

- Passwords must contain a combination of the following characters: a-z, A-Z, 0-9, {, }, |, (, ), <, >, ,, /, ., =, [, ], ^, \_ ,@, !, \$, %, &, -, +, ", :, ?, `, or ;
- Passwords must contain at least one each of the following characters:
  - A lowercase letter
  - An uppercase letter
  - A number
  - A special character
- Password can contain maximum of 2 consecutive characters. The valid values are from 1 through 5. The default value is 2.
- Password can contain maximum number of 4 consecutive characters from the same character type. The valid values are from 1 through 5. The default value is 4.

If a password does not meet the password strength policy, the system rejects the password. You can disable the password policy.

## Editing the password policy for the communication profile

### Procedure

1. On the System Manager web console, click **Users > User Management > Communication Profile Password Policy**.
2. On the Communication Profile Password Policy page, do the following:
  - a. On the **Aging Policy** tab, select the **Enforce password aging policy** check box, and modify the required fields.
  - b. On the **History Policy** tab, select the **Enforce policy against previously used passwords** check box, and type the value in the **Previous passwords blocked** field.
  - c. On the **Strength Policy** tab, select the **Enforce password content standards** check box, and modify the required fields.

For information about the fields, see “Communication Profile Password Policy field descriptions”.

3. Click **Commit**.

System Manager saves the changes to the password policy for the communication profile password.

# Chapter 8: Managing user provisioning rules

---

## User Provisioning Rule

System Manager provides workflows to streamline the user provisioning process. You can apply a user provisioning rule with other LDAP Synchronization Capabilities to achieve fully automated user provisioning. You can also assign a communication profile to every user.

A user provisioning rule includes a master communication profile template and a set of provisioning rules. A user provisioning rule enables predefined templates that consist of user attributes found in the communication profile of the user. In the user provisioning rule, the administrator specifies the following information to provision the user:

- Basic information that includes the communication profile password, time zone, and language preference
- The communication system that the user must use, for example, Communication Manager
- The method to assign or create a communication profile for the user, for example, by assigning the next available extension for Communication Manager

When the administrator creates the user using the user provisioning rule, the system populates the following data based on the user provisioning rule:

- The default values
- The communication addresses
- The communication profiles for the user

You can create and apply the user provisioning rule only if you have administrator credentials. The administrator can assign only one user provisioning rule to every user. The administrator can provision the user using the user provisioning rule from one of the following System Manager user interfaces:

- Web Console
- Web Services
- Folder name Synchronization
- Bulk import

**\* Note:**

To perform the user provisioning by using the user provisioning rule, map the user to the role with the following permissions:

| Resource type                 | Permissions |
|-------------------------------|-------------|
| All elements of type:elements | view        |

---

## Capabilities and guidelines of user provisioning rules

### Capabilities of user provisioning rules

The user provisioning rule is a template that is used to create a user. You can define and apply a user provisioning rule only if you have administrator credentials. You can use the user provisioning rule for the initial provisioning and while creating the user. User provisioning rules cannot be used after they are applied. After you create a user by using a user provisioning rule, System Manager populates the following data based on the rules defined in the user provisioning rule:

- The default values
- The communication addresses
- The user attributes from the communication profiles

### General guidelines

- After you define a user provisioning rule and apply the rule to create a user, you cannot edit the communication profile associated with the user provisioning rule. You cannot change, delete, or add the data in the communication profile by using the user provisioning rule. You can assign only one communication profile to a user provisioning rule.

**\* Note:**

When you define user provisioning rule with elements data in the **Communication Profile** section, and later if you change value for Session Manager, Communication Manager Templates, and Messaging elements, then you must update the existing user provisioning rule with latest element data.

If the user provisioning rule and communication profile data are available from the System Manager user interface or bulk import, the communication profile data that you provide takes the precedence. System Manager does not use the communication profile data from the user provisioning rule.

- After you create the user by using the user provisioning rule, you can modify values of an existing communication profile by using one of the following System Manager user provisioning interfaces:
  - System Manager native user interface
  - Web Services API
  - Bulk import and export
  - Global Endpoint Change Editor

Also, you can add another communication profile by using a different user provisioning rule.

- Whenever a user provisioning rule is used while creating or updating a user, the administrator should not manually remove any communication profile.

### **Guidelines for upgrading Communication Manager and Messaging elements**

1. Before upgrading the Communication Manager and Messaging elements to major Release 6.3.x and later, note down the Communication Manager and Messaging templates associated with user provisioning rule in System Manager.
2. Once the Communication Manager or Messaging element is upgraded, then templates associated with old release of Communication Manager and Messaging will get unlinked for existing user provisioning rule. Therefore, after upgrading Communication Manager and Messaging elements:
  - a. Create custom templates for the current release of Communication Manager and Messaging.
  - b. Update existing user provisioning rule with newly created custom templates or default templates of Communication Manager and Messaging as per the user provisioning rule guidelines.

---

## **Adding User Provisioning Rules**

### **About this task**

Add a service defined in a communications profile to an existing user that was created by using a user provisioning rule.

### **Procedure**

1. Create a new user provisioning rule with the new service defined in the communication profile of the new rule.

The system adds the new service defined in the communications profile to the existing user.

You can add any of the following services:

- Presence
  - Messaging
  - Avaya Breeze® platform
2. Apply the user provisioning rule to the user through LDAP synchronization.
  3. Update the LDAP enterprise directory with the new user provisioning rule.
  4. Synchronize users.

The system creates a new communication profile for the user.

---

## Creating the user provisioning rule

### Procedure

1. Log on to System Manager with administrator privilege credentials.
  2. On the System Manager web console, click **Users > User Provisioning Rule**.
  3. On the User Provisioning Rules page, click **New**.
  4. On the New User Provisioning Rule page, do the following:
    - a. On the **Basic** tab, enter the appropriate information.
    - b. On the **Communication Profile** tab, select the appropriate communication profile, and enter the appropriate information.
    - c. On the **Organization** tab, enter the appropriate information.
- For more information, see “User Provisioning Rule field descriptions”.
5. Click **Commit** to save the changes.

## Modifying the user provisioning rule

### Before you begin

Create a user provisioning rule.

### Procedure

1. Log on to System Manager with administrator privilege credentials.
2. On the System Manager web console, click **Users > User Provisioning Rule**.
3. On the User Provisioning Rules page, select the user provisioning rule.
4. To edit the user provisioning rule, click one of the following:
  - **Edit**.
  - **View > Edit**.
5. On the Edit User Provisioning Rule page, do the following:
  - a. On the **Basic** tab, modify the appropriate information.

#### Note:

- System Manager does not automatically modify the user if the user provisioning rule changes.

- You can select a different user provisioning rule when you modify the user information.
- b. On the **Communication Profile** tab, modify the communication profile information as appropriate.
- c. On the **Organization** tab, modify the appropriate information.

For information, see “User Provisioning Rule field descriptions”.

6. Click **Commit**.

## Creating a duplicate user provisioning rule

### About this task

You can create a new user provisioning rule by duplicating the information from an existing user provisioning rule.

### Procedure

1. Log on to System Manager with administrator privilege credentials.
2. On the System Manager web console, click **Users > User Provisioning Rule**.
3. On the User Provisioning Rules page, click the user provisioning rule.
4. Click **Duplicate**.

5. On the Duplicate User Provisioning Rule page, do the following:
  - a. On the **Basic** tab, change the appropriate information.
  - b. On the **Communication Profile** tab, change the communication profile information as appropriate.
  - c. On the **Organization** tab, change the appropriate information.For more information, see “User Provisioning Rule field descriptions”.
6. Click **Commit**.

## Deleting a user provisioning rule

### Procedure

1. Log on to System Manager with administrator privilege credentials.
2. On the System Manager web console, click **Users > User Provisioning Rule**.
3. On the User Provisioning Rules page, select one or more user provisioning rules.
4. Click **Delete**.
5. On the Delete User Provisioning Rule page, click **Delete**.

System Manager:

- Removes the selected user provisioning rule.
- Disassociates the user provisioning rule from the user if you have already provided the user provisioning rule for the user.

## User Provisioning Rules field descriptions

| Name               | Description                                    |
|--------------------|------------------------------------------------|
| <b>Name</b>        | The name of the user provisioning rule.        |
| <b>SIP Domain</b>  | The name of the configured SIP domain name.    |
| <b>Description</b> | The description of the user provisioning rule. |

| Button           | Description                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View</b>      | Displays the View User Provisioning Rule page with details of the user provisioning rule that you selected.                                                                                                                                 |
| <b>Edit</b>      | Displays the Edit User Provisioning Rule page where you can modify the selected rule.                                                                                                                                                       |
| <b>New</b>       | Displays the New User Provisioning Rule page where you can create a new rule.                                                                                                                                                               |
| <b>Delete</b>    | Deletes the selected user provisioning rule.                                                                                                                                                                                                |
| <b>Duplicate</b> | Duplicates the selected user provisioning rule.                                                                                                                                                                                             |
| <b>Select</b>    | <p>Selects a user provisioning rule in the table. The options are:</p> <ul style="list-style-type: none"> <li>• <b>All</b>: To select all user provisioning rules in the table.</li> <li>• <b>None</b>: To clear the selections.</li> </ul> |

| Icon                                                                              | Name    | Description                                                    |
|-----------------------------------------------------------------------------------|---------|----------------------------------------------------------------|
|  | Refresh | Refreshes the user provisioning rule information in the table. |

## New User Provisioning Rule field descriptions

### Basic

| Name                               | Description                                                                                                                                                                                                                                                                                            |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Provisioning Rule Name</b> | The name of the user provisioning rule.                                                                                                                                                                                                                                                                |
| <b>Description</b>                 | A description of the user provisioning rule.                                                                                                                                                                                                                                                           |
| <b>SIP Domain</b>                  | <p>The name of the configured SIP domain name.</p> <p>If <b>SIP Domain</b> is nonblank, create an Avaya SIP communication address for the user.</p> <p>The system changes the SIP domain for all selected users with the value that you provide in this field.</p>                                     |
| <b>Presence/IM Domain</b>          | <p>The name of the configured Presence domain name.</p> <p>If <b>Presence/IM Domain</b> is nonblank, create an Avaya Presence/IM communication address for the user.</p> <p>The system changes the Presence/IM Domain domain for all selected users with the value that you provide in this field.</p> |

*Table continues...*

| Name                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Communication Profile Password</b>                   | <p>The communication profile password.</p> <p>The field is available only if you enable the communication profile. The password policy is configured on the <b>Users &gt; User Management &gt; Communication Profile Password Policy</b> page.</p> <p>When you provide the communication password value during bulk edit of users, the system overwrites any existing communication profile passwords of the user.</p>                                                                                          |
| <b>Confirm Password</b>                                 | The communication profile password that you must re-enter.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Use Phone Number last ..... digits for Extension</b> | <p>The number of last digits of the phone number that the system uses from the LDAP attribute.</p> <p>E.164 numbers can contain maximum 13 digits. Usually, the numbers are written with a plus (+) as the prefix. The system populates the phone number that is mapped to the LDAP attribute with the value in the <b>Prefix for Avaya E164 Handle</b> field.</p> <p>The LDAP attribute is mapped to the <code>PhoneNumber</code> attribute of System Manager on the User Synchronization Datasource page.</p> |
| <b>Prefix for Avaya E164 Handle</b>                     | The digits that the system must prefix to the telephone number or Avaya E.164 handle. The default is plus (+).                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Language Preference</b>                              | The preferred written or spoken language of the user. For example, English.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Time Zone</b>                                        | The preferred time zone of the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Button        | Description                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Commit</b> | Creates the user provisioning rule and displays the User Provisioning Rule page.                                                             |
| <b>Cancel</b> | Cancels the create, edit, or delete operation of the user provisioning rule.                                                                 |
| <b>Done</b>   | <p>Saves the changes that you make to the user provisioning rule.</p> <p>The system displays this button only during the view operation.</p> |
| <b>Edit</b>   | <p>Displays the fields in the edit mode.</p> <p>The system displays this button only during the view operation.</p>                          |

**Communication Profile tab: Session Manager Profile****\* Note:**

The system displays the following fields only if a communication profile of the user exists for the product:

| Name                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Primary Session Manager</b>   | The instance that you want to use as the home server for the currently displayed communication profile. As a home server, the selected primary Session Manager instance is used as the default access point for connecting devices associated with the communication profile to the Avaya Aura <sup>®</sup> network. You must select the primary Session Manager server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Secondary Session Manager</b> | The Session Manager instance that you select as the secondary Session Manager. It provides continued service to SIP devices associated with this communication profile when the primary Session Manager server becomes unavailable. A selection is optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Survivability Server</b>      | <p>For local survivability, you can specify a survivability server to provide survivability communication services for devices associated with a communication profile when the local connectivity to Session Manager instances in Avaya is lost. If you select Branch Session Manager, and the termination and origination application sequences contain a Communication Manager application, sequencing to this application continues, locally, to Communication Manager survivable remote server resident with Branch Session Manager. A selection is optional.</p> <p><b>* Note:</b></p> <p>If a termination or origination application sequence contains a Communication Manager application, the Communication Manager instance associated with the application must be the main server for the Communication Manager survivable remote server that resides with Branch Session Manager.</p> <p>After typing minimum of 3 characters, wait for three seconds to capture the final keyword, and fetch the required results.</p> |

*Table continues...*

| Name                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Max. Simultaneous Devices</b>                                | The maximum number of endpoints that you can register at a time by using this communication profile. If you register more than one endpoint, all the endpoints receive calls simultaneously.                                                                                                                                                                                                                                          |
| <b>Block New Registration When Maximum Registrations Active</b> | If you select the check box and an endpoint attempts to register using this communication profile after the registration requests exceed the administered limit, the system denies any new registrations with Session Manager. The system sends a warning message and stops the SIP service to the endpoint.                                                                                                                          |
| <b>Origination Application Sequence</b>                         | <p>The application sequence that the system invokes when routing calls from this user. A selection is optional.</p> <p> <b>Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p>   |
| <b>Termination Application Sequence</b>                         | <p>The application sequence that is invoked when the system routes calls to this user. A selection is optional.</p> <p> <b>Note:</b></p> <p>If you specify origination and termination application sequences, and if each sequence contains a Communication Manager application, Communication Manager must be the same in both the sequences.</p> |
| <b>Emergency Calling Origination Sequence</b>                   | The list of application sequences invoked when the system routes emergency calls from this user.                                                                                                                                                                                                                                                                                                                                      |
| <b>Emergency Calling Termination Sequence</b>                   | The list of application sequences invoked when the system routes emergency calls to this user.                                                                                                                                                                                                                                                                                                                                        |
| <b>Home Location</b>                                            | The home location to support mobility for the currently displayed user. Session Manager uses the home location specifically when the IP address of the calling phone does not match the IP Address Pattern of any location. You must specify a value.                                                                                                                                                                                 |
| <b>Conference Factory Set</b>                                   | <p>The conference factory set to enable media capability-based call routing to the Conferencing SIP entities.</p> <p>Use the <b>Session Manager &gt; Application Configuration &gt; Conference Factories</b> webpage to administer the Conference Factory Sets.</p>                                                                                                                                                                   |

**Communication Profile tab: Avaya Breeze® platform Profile**

| Name                   | Description                                                                                                |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Service Profile</b> | The profile that you assign to the user. The user can gain access to the service contained in the profile. |

**Communication Profile tab: CM Endpoint Profile****\* Note:**

The system displays these fields only if a Communication Manager Endpoint profile exists for the user.

| Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Next Available Extension</b> | <p>The option to instruct the system to create a new extension for the user.</p> <p><b>* Note:</b><br/>For LDAP synchronization, the value in the <b>Use Phone Number last ..... digits for Extension</b> field takes priority.</p>                                                                                                                                                           |
| <b>Template</b>                     | The template, system defined or user defined, that you associate with the endpoint. Select the template based on the set type you add.                                                                                                                                                                                                                                                        |
| <b>Sub Type</b>                     | This field is configured for CS 1000 station types only. You can select the specific set for <b>Set Type</b> . On the Manage Endpoint page, <b>Sub Type</b> is labeled as <b>Set</b> .                                                                                                                                                                                                        |
| <b>System ID</b>                    | <p>This field is configured for CS 1000 station types only. This field allows you to leave the field blank or enter a string of up to 9 characters. With Release 8.0 more than one station can use the combination of <b>System ID</b> and <b>Terminal Number</b>.</p> <p>With Release 8.0.1, each station must have a unique combination of <b>System ID</b> and <b>Terminal Number</b>.</p> |
| <b>Security Code</b>                | The security code for authorized access to the endpoint.                                                                                                                                                                                                                                                                                                                                      |
| <b>Preferred Handle</b>             | Avaya SIP or Avaya E.164 handle that is administered for the user. The field is optional. By default, the field is blank.                                                                                                                                                                                                                                                                     |
| <b>Password</b>                     | <p>The password to gain access to the endpoint.</p> <p>The system displays the field if you select <b>Agent</b> in <b>Profile Type</b>.</p>                                                                                                                                                                                                                                                   |

*Table continues...*

| Name                                                  | Description                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allow H.323 and SIP Endpoint Dual Registration</b> | The option to register an H.323 endpoint and a SIP endpoint together at the same time to the same extension. For more information about the SIP and H.323 dual registration feature, see <i>Avaya Aura® Communication Manager Feature Description and Implementation</i> on the Avaya Support website at <a href="http://support.avaya.com">http://support.avaya.com</a> . |

### Communication Profile tab: CS 1000 Endpoint Profile

| Name                                                     | Description                                                                                                                               |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                                            | The system that will be the element manager of the CS 1000 endpoint profile. You must select the system.                                  |
| <b>Target</b>                                            | The phone or endpoint template that you can choose for the user. The element manager maintains all templates. You must select a template. |
| <b>Template</b>                                          | The phone or endpoint template that you can choose for the user. The element manager maintains all templates. You must select a template. |
| <b>Include in Corporate Directory</b>                    | The option to add this profile to the CS 1000 Corporate Directory feature.                                                                |
| <b>Delete Endpoint on Unassign of Endpoint from User</b> | An option to specify whether to delete the endpoint from the CS 1000 system when you unassign the endpoint from the user.                 |

### Communication Profile tab: Messaging Profile

 **Note:**

The system displays the following fields only if you can configure a messaging profile for the user

| Name                  | Description                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>         | The messaging system on which you add the subscriber. You must select the system.                                                                                                                                                                                                                                                                                          |
| <b>Mailbox Number</b> | The mailbox number of the subscriber. The options are: <ul style="list-style-type: none"> <li>• Use CM Extension: Use this option only if the Communication Manager profile and Session Manager profile are specified.</li> <li>• Use Next Available Subscriber: Use this option if the system must use the next mailbox number to associate with this profile.</li> </ul> |

*Table continues...*

| Name                                                                           | Description                                                                                                                                                                            |
|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Template</b>                                                                | The system-defined or user-defined template that you associate with the subscriber.                                                                                                    |
| <b>Password</b>                                                                | The password for logging in to the mailbox. You must provide the password.                                                                                                             |
| <b>Delete Subscriber on Unassign of Subscriber from User or on Delete User</b> | The option to specify whether to delete the subscriber mailbox from the Messaging device or Communication System Management when you remove this Messaging profile or delete the user. |

### Communication Profile tab: Avaya Messaging Profile

| Name                              | Description                                                                                                                                                                                                                                                                               |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                     | The Avaya Messaging system to which you add a mailbox.                                                                                                                                                                                                                                    |
| <b>Refresh</b>                    | <p>The option to get information about company, departments, and feature groups from Avaya Messaging and save locally on System Manager for future use.</p> <p>You do not require to refresh for every user.</p>                                                                          |
| <b>Use Next Available Mailbox</b> | The option to specify if the system must use the next mailbox number to associate with this profile.                                                                                                                                                                                      |
| <b>Mailbox Range</b>              | <p>The range of mailbox numbers assigned to the Avaya Messaging system.</p> <p> <b>Note:</b></p> <p>This option is available only when you select the <b>Use Next Available Mailbox</b> check box.</p> |
| <b>Numeric Password</b>           | The numeric password that is used to log in to the Avaya Messaging system.                                                                                                                                                                                                                |
| <b>Application User Password</b>  | The password that is used to gain access to non-telephone applications, such as Web Client, iLink Pro, iLink Pro Mobile, and iLink Pro Desktop.                                                                                                                                           |
| <b>Company</b>                    | The name of the company to which the user belongs.                                                                                                                                                                                                                                        |
| <b>Department</b>                 | The department to which the user belongs.                                                                                                                                                                                                                                                 |
| <b>Feature Group</b>              | The feature group name that determines the rules for the mailboxes associated with it.                                                                                                                                                                                                    |

*Table continues...*

| Name                             | Description                                                                                                                                                                                                                                                                  |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Capability</b>                | <p>The type of functionality that the user contains. The values are:</p> <ul style="list-style-type: none"> <li>• <b>Standard</b></li> <li>• <b>Fax</b></li> <li>• <b>Messaging</b></li> <li>• <b>Collaboration</b></li> <li>• <b>Messaging and Collaboration</b></li> </ul> |
| <b>Domain Account Name</b>       | <p>The mailbox NT account name for the Avaya Messaging profile. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Same as Login Name</b></li> <li>• <b>Admin Specified</b></li> </ul>                                                                         |
| <b>Synchronization User Name</b> | <p>The account name that is used to gain access to the email server, for example, Microsoft Exchange and Google Gmail.</p> <p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>Same as Login Name</b></li> <li>• <b>Admin Specified</b></li> </ul>           |

### Communication Profile tab: IP Office Endpoint Profile

| Name             | Description                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>    | The list of IP Office device names from which you can select the IP Office device that you associate with the user. You must select the template.                                                                                                                                                                                                                                    |
| <b>Extension</b> | <p>The extension of the endpoint to which you associate the profile. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Use CM Extension:</b> Use this option only if Communication Manager profile is specified.</li> <li>• <b>Use Next Available Extension:</b> Use this option if the system must use the next extension to associate with this profile.</li> </ul> |
| <b>Template</b>  | A list of user templates from which you can select a template to set the user configurations.                                                                                                                                                                                                                                                                                        |
| <b>Set Type</b>  | The set type for the IP Office endpoint profile. By default, the <b>Set Type</b> field is disabled. If you select a template, the system automatically populates the set type value.                                                                                                                                                                                                 |

**Communication Profile tab: Presence Profile**

| Name                                       | Description                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>                              | The Presence Services instance that is the home Presence Services server for the user. You must select an instance. As a home server, the Presence Services instance can perform the following for the communication profile: <ul style="list-style-type: none"> <li>• Aggregate presence</li> <li>• Archive instant messages if the Instant Messages option is enabled</li> </ul>      |
| <b>SIP Entity</b>                          | The option to route the SIP-based messages through Presence Services. This system selects the SIP entity only if you select a Presence Services instance in the <b>System</b> field. <b>SIP Entity</b> is read-only. If the system cannot identify a SIP entity, an appropriate error message is displayed in the field.                                                                |
| <b>IM Gateway SIP Entity</b>               | The Presence Services instance for the user.                                                                                                                                                                                                                                                                                                                                            |
| <b>Publish Presence with AES Collector</b> | The option that determines if Presence Services must publish presence with AES Collector. The options are: <ul style="list-style-type: none"> <li>• <b>System Default</b></li> <li>• <b>Off</b></li> <li>• <b>On</b></li> </ul> The default is <b>System Default</b> . You can change the default value. You do not require to configure AES Collector in the Presence Services server. |

**Communication Profile tab: Conferencing Profile**

| Name/Button                                                   | Description                                                                                                                                                                                    |
|---------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Template</b>                                               | The template that you use to set the user configurations.                                                                                                                                      |
| <b>Location</b>                                               | The location that Conferencing uses when the IP address of the calling phone does not match any IP address pattern of any location.<br>Specify this field to support the mobility of the user. |
| <b>Select Auto-generated Code Length</b>                      | The number of digits in the security code that the system generates.                                                                                                                           |
| <b>Auto Generate Participant and Moderator Security Codes</b> | The check box that you select to instruct the system to generate the security codes for the participant and moderator.                                                                         |

**Communication Profile tab: Equinox Profile**

| Name/Button                  | Description                                                                   |
|------------------------------|-------------------------------------------------------------------------------|
| <b>Equinox User Password</b> | The password that is used to log in to the Avaya Workplace Client Management. |

*Table continues...*

| Name/Button                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Virtual Room Number</b> | <p>The number of a virtual room that is used to create a conference.</p> <p>By default Virtual Room Number serves as Meeting ID when a conference is created. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Use Phone Number:</b> This will use Communication Manager extension. Use this option only if Communication Manager profile is already associated with the user or being associated with the user.</li> <li>• <b>Auto Generate Virtual Room Number:</b> Use this option if the system needs to generate the Virtual Room Number automatically.</li> </ul> |

## Organization

| Name/Button       | Description                                                       |
|-------------------|-------------------------------------------------------------------|
| <b>Tenant</b>     | The tenant of the user created by the user provisioning rule.     |
| <b>Site</b>       | The work site of the user created by the user provisioning rule.  |
| <b>Department</b> | The department of the user created by the user provisioning rule. |
| <b>Team</b>       | The team of the user created by the user provisioning rule.       |

| Button        | Description                                                          |
|---------------|----------------------------------------------------------------------|
| <b>Commit</b> | Saves the changes and displays the User Provisioning Rules page.     |
| <b>Cancel</b> | Cancels the operation and displays the User Provisioning Rules page. |

# Chapter 9: Managing elements

---

## Importing users from Subscriber Manager to User Management

---

### User data import to System Manager

The User Profile Management (UPM) service in System Manager is a single point of administration for user profile data associated with multiple Avaya products. Similarly, the Subscriber Manager service in CS 1000 UCM is a single point of administration for user profile data for Heritage Nortel products. In System Manager 6.1, the UPM and Subscriber Manager applications coexist and are part of System Manager. Element Managers use:

- UPM to manage users for Heritage Avaya products
- Subscriber Manager to manage users for Heritage Nortel products

In System Manager 6.2, Subscriber Manager is merged into UPM and is called User Management (UM). UM includes several Subscriber Manager features. With the removal of Subscriber Manager, perform the steps listed in this section on System Manager 6.1 and 6.2 or later to ensure that the subscriber data is successfully migrated to UM of System Manager 6.2 and later.

#### Prerequisites

Register CS 1000 with the preupgraded System Manager Release 6.1 primary security domain.

Moving users and accounts from Subscriber Manager to User Management involves the following key procedures:

- On System Manager Release 6.1: Preparing the Subscriber Manager user data for import to User Management. This preimport procedure copies the Subscriber Manager Universally Unique ID (UUID) of the user to another field which can be preserved during the import to User Management. After the import, you must use the UUID to reassociate phones and mailboxes.
- On System Manager Release 6.1: Importing the Subscriber Manager user data to User Management. This procedure transfers the user data from the Subscriber Manager directory to the User Management database using LDAP synchronization.
- On System Manager Release 6.2 and later: Performing postimport tasks that involve:
  - Exporting the users to an XML file to assign communication profile passwords in User Management and reimporting the users.

- Creating the communication profile for each user and performing profile synchronization in User Management for CS 1000 element that you import.

---

## Preparing the Subscriber Manager user data for import to User Management

You must perform this procedure on System Manager Release 6.1.

### Before you begin

- Ensure that you install the latest CS 1000 Service Pack on all the CS 1000 network elements.
- Ensure that you update all Subscriber Manager user profiles for completeness that includes First Name, Last Name, and Preferred Name / CPND Name.
- Ensure that you synchronize Subscriber Manager and the CS 1000 network elements and that you upload Corporate Directory and Numbering Groups to the CS 1000 network elements.
- Ensure that the firewall is stopped on System Manager Release 6.1. Perform the following to verify that the firewall is stopped:
  1. Using the command line interface, log in to System Manager Release 6.1 as `root`.
  2. Enter `service iptables status`.  
The system must indicate that the firewall service has stopped.
  3. If firewall is enabled, enter `service iptables stop`.  
The system stops the firewall service.

### Procedure

1. Log on to the Web console of System Manager Release 6.1.
2. On the Avaya Unified Communications Management page, click **Network > Subscriber Manager**.
3. In the left navigation pane, click **CSV Export**.
4. Click **Generate** on the upper-right of the page to create a new CSV file with the latest subscriber data.
5. Click **Download** on the upper-right of the page to download the subscriber data to your computer.  
Note the location of the `subscribers.csv` file.
6. Open the `subscribers.csv` file using Microsoft Excel and perform the following steps:
  - a. Copy the data from the **UUID** column to the **postOfficeBox** column, without the column header information. This is to ensure that the Subscriber Manager datastore UUID is mapped to a column that the UPM LDAP datastore synchronization supports. For example:

| entryUUID                            | postOfficeBox                        |
|--------------------------------------|--------------------------------------|
| c0bbc2d2-3096-4ce8-8fca-2670ea681be3 | c0bbc2d2-3096-4ce8-8fca-2670ea681be3 |
| 86d11715-3b36-4238-be37-5284ca7a7a68 | 86d11715-3b36-4238-be37-5284ca7a7a68 |

- b. Copy the data from the **ucDomain** to the **User ID (uid)** column. For example:

| ucDomain     | uid                |
|--------------|--------------------|
| ca.avaya.com | user1@ca.avaya.com |
| ca.avaya.com | user2@ca.avaya.com |

- c. Save the modified `subscribers.csv` file in a csv format.
7. To synchronize the Subscriber Manager data with the modified `subscribers.csv` file, import the modified Subscriber Manager data in the `subscribers.csv` file back to Subscriber Manager and perform the following steps:
- In the left navigation panel, on the **Subscriber Manager**, click **CSV Synchronization**.
  - Browse to the location where you saved the modified `subscribers.csv` file.
  - Click **Synchronize**.
  - Click **View Results** to verify that the synchronization is successful.
- If error occurs, the page displays the location of the error logs on the System Manager server. For example, `/opt/nortel/cnd/log/LDAP_Sync`.
- Click **Subscribers**, leave the **Name** field blank, and click **Search**.
  - Select one of the user and verify that the system updated the **Unified Communication Username** field correctly.
- The system does not display the **postOfficeBox** field.
8. If Numbering Groups are used, perform the following:
- Click **UCM Services > Numbering Groups**.
  - Click **Generate**.
  - Click **Export** to export the data to a location on your computer to ensure that the data is captured.

## Importing the Subscriber Manager user data to User Management

### Before you begin

- Log on to the web console of System Manager Release 6.1.
- Prepare the Subscriber Manager user data for import to User Management.

### Procedure

- On the System Manager web console, click **Users > Synchronize and Import**.

2. In the navigation pane, click **Sync Users**.
3. To create a new LDAP synchronization source, on the **Synchronization Datasources** tab, click **New** and enter the directory parameters as listed in the Subscriber Manager datasource parameters and attributes table.

Directory Parameters

|                           |                           |
|---------------------------|---------------------------|
| * Datasource Name         | cn                        |
| * Host                    | localhost                 |
| * Principal               | uid=admin,ou=People,dc=   |
| * Password                |                           |
| * Port                    | 389                       |
| * Base Distinguished Name | dc=nortel,dc=com          |
| * LDAP User Schema        | inetOrgPerson             |
| * Search Filter           | (objectClass=nortelSubscr |
| Use SSL                   | <input type="checkbox"/>  |
| Allow Deletions           | <input type="checkbox"/>  |
| Allow Null values in LDAP | <input type="checkbox"/>  |
| Test Connection           |                           |

---

Attribute Parameters

|               |                  |
|---------------|------------------|
| Add Mapping   |                  |
| postOfficeBox | -> sourceUserKey |
| uid           | -> loginName     |
| sn            | -> surname       |
| givenName     | -> givenName     |
| displayName   | -> displayName   |

**\* Note:**

If a subscriber does not have an account or the **cpndName** field is blank, you can map Last name, First Name to the displayName attribute of System Manager.

4. Click **Test Connection** to verify that the system can establish connection to the cn database.
5. Perform the following steps to run the LDAP synchronization job:
  - a. On the Sync Users page, on the **Active Synchronization Jobs** tab, click **Create New Job**.
  - b. On the New User Synchronization Job page, in the **Datasource Name** field , select the name of the datasource and click **Run Job**.

The system starts the synchronization of the Subscriber Manager datastore with the User Management datastore.

6. On the Sync Users page, on the **Synchronization Job History** tab, click **View Job Summary** for the cn job, and verify that the system successfully imported the users in the **Added** and **Modified** fields.

**\* Note:**

The **Failed** field might contain some errors due to the import of unsupported fields.

7. To verify that the users are available in User Management, do the following:

- a. Navigate to **Users > User Management > Manage Users**.
- b. On the User Management page, select a user and click **View** or **Edit** and verify that the System Manager Release 6.1 is configured correctly.

System Manager Release 6.1 now contains User Management configured with the Subscriber Manager data. The system is now ready for upgrading to System Manager Release 6.2 and later.

## Subscriber Manager datasource parameters and attributes

Use the values from the following tables to update the fields on the Edit User Synchronization Datasource page.

### Directory Parameters

| Parameter                        | Value                                                           |
|----------------------------------|-----------------------------------------------------------------|
| <b>Datasource Name</b>           | cnd                                                             |
| <b>Host</b>                      | For UPM: localhost<br>For CS 1000: <CS 1000 UCM R7.X Server IP> |
| <b>Principal</b>                 | applicationName=subMgr,ou=Applications,dc=Nortel,dc=com         |
| <b>Password</b>                  | submgrpass                                                      |
| <b>Port</b>                      | 389                                                             |
| <b>Base Distinguished Name</b>   | dc=nortel,dc=com                                                |
| <b>LDAP User Schema</b>          | inetOrgPerson                                                   |
| <b>Search Filter</b>             | (objectClass=nortelSubscriber)                                  |
| <b>Use SSL</b>                   | Clear the check box                                             |
| <b>Allow Deletions</b>           | Clear the check box                                             |
| <b>Allow Null values in LDAP</b> | Clear the check box                                             |

### Attribute Parameters

Map the following attributes of the Subscriber Manager datasource to the attributes of the User Management datastore.

| Subscriber Manager attribute | User Management attribute | Import Type | Description                                    |
|------------------------------|---------------------------|-------------|------------------------------------------------|
| uid                          | loginName                 | text        | Modified Subscriber Manager uid: user1@domain. |
| sn                           | surname                   | text        |                                                |
| postOfficeBox                | sourceUserKey             | text        | Saved Subscriber Manager UUID.                 |
| givenName                    | givenName                 | text        |                                                |
| displayName                  | displayName               | text        |                                                |

## Exporting the user data and creating the user profile

To complete the import job of the user data from Subscriber Manager, you must perform the following procedure after you complete the server upgrade from System Manager Release 6.1 to Release 6.2 and later.

### Before you begin

Start an SSH session.

### About this task

The system does not support the export of users and user profiles in bulk from the web console of System Manager Release 6.2 and release earlier than 6.3.8. Therefore, use the command line interface of System Manager to perform bulk export activities.

### Procedure

1. Log on to the system on which you want to export the user data as root.
2. Export the users and the user profiles using the following steps:
  - a. Perform one of the following:
    - For System Manager 6.3.8 and later, use the web console to export the user data.  
For more information, see [Exporting users in bulk](#).
    - For System Manager 6.3, type `cd $MGMT_HOME/bulkadministration/exportutility/`.
    - For System Manager 6.2, type `$MGMT_HOME/upm/bulkexport/exportutility/`.
  - b. For System Manager release earlier than 6.3.8, type `sh exportUpmUsers.sh`.  
The system creates an XML file `exportfile_<time stamp in milliseconds>.zip` in the `$MGMT_HOME/upm/bulkexport/` location.
3. Copy the zip file on the desktop of your local computer and extract the XML file.  
Note the location where you saved the file.

## 4. Make the following edits to the XML file:

- a. Add the `<commPassword>password_value</commPassword>` tag after the `<userName>` tag to assign the communication profile password in User Management.

 **Note:**

The password must have at least seven characters and the first character must not be a digit or a special character such as `<`, `>`, `^`, `%`, `$`, `@`, `#` and `*`.

- b. Delete the `<userPassword>userpassword_value</userPassword>` tag.

For example:

```
<tns:user>
 <authenticationType>enterprise</authenticationType>
 <displayName>user1</displayName>
 <displayNameAscii>user1</displayNameAscii>
 <dn>cn=f225860c-2f2c-4290-
a660-660e51fe0d4f,ou=Subscribers,dc=nortel,dc=com</dn>
 <isDuplicatedLoginAllowed>false</isDuplicatedLoginAllowed>
 <isEnabled>true</isEnabled>
 <isVirtualUser>false</isVirtualUser>
 <givenName>first1</givenName>
 <loginName>user1@ca.avaya.com</loginName>
 <preferredLanguage>en-US</preferredLanguage>
 <source>cnd</source>
 <sourceUserKey>c0bbc2d2-3096-4ce8-8fca-2670ea681be3</sourceUserKey>
 <status>provisioned</status>
 <surname>last1</surname>
 <userName>user1</userName>

 <commPassword>123456</commPassword>

 <roles>
 <role>End-User</role>
 </roles>
 <ownedContactLists>
 <contactList>
 <name>list-user1_ca.avaya.com</name>
 <isPublic>false</isPublic>
 <contactListType>general</contactListType>
 </contactList>
 </ownedContactLists>
 <commProfileSet>
 <commProfileSetName>Primary</commProfileSetName>
 <isPrimary>true</isPrimary>
 </commProfileSet>
</tns:user>
```

## 5. Reimport the user data from the modified XML files to the Import users page on the web console.

You can navigate to the Import users page from **Services > Bulk Import and Export > Import > User Management > Users** on the web console. For more information, see Bulk importing of users.

 **Note:**

The system might display an error message when you reimport the modified user data for admin user because the XML file includes the admin user when you export the user data. Ignore the message because you cannot edit the data for the admin user.

6. To create a user profile, synchronize profile in User Management for CS 1000 element that are being imported. For information on profile synchronization, see Synchronizing CS 1000 profiles.

---

## Importing users from CS 1000 Subscriber Manager to User Management

---

### CS 1000 Subscriber Manager data import options

If CS 1000 Release 7.x is available while installing System Manager 6.2 or later, you can import the CS 1000 Release 7.x Subscriber Manager user data into System Manager User Management.

Use one of the following options to import the CS 1000 Subscriber Manager data:

- Using the active primary CS 1000 Subscriber Manager server to LDAP synchronize the Subscriber Manager data.
- Using the CND or LDAP Data Interchange Format (LDIF) output to capture the CS 1000 Subscriber Manager data.

---

### Preparing the CS 1000 Subscriber Manager user data for import to System Manager

This option uses the active primary CS 1000 Subscriber Manager server for System Manager User Management to perform an LDAP synchronization of the user data.

**Procedure**

1. Log in to the primary CS 1000 UCM server command line using one of the following user names:
  - For CS 1000 Release 7.5 systems, admin2
  - For CS 1000 Release 7.0 and later systems, nortel

2. On the CS 1000 Release 7.x UCM server, perform the steps outlined in Preparing the Subscriber Manager user data for import to User Management.

## Importing the CS 1000 Subscriber Manager user data to System Manager

### Before you begin

- Prepare the CS 1000 Subscriber Manager user data for import to System Manager.
- Ensure that the firewall is stopped on the CS 1000 Release 7.x server to gain access to System Manager UPM LDAP.

### Procedure

1. Log on to the Web console of System Manager Release 6.2 or later.
2. Perform the LDAP synchronization as outlined in Importing the Subscriber Manager user data to User Management.

For the directory parameters that you must use, see Subscriber Manager datasource parameters and attributes.

## Preparing the CS 1000 Subscriber Manager user data for import to System Manager

This method uses the CND or LDIF output to capture the CS 1000 Subscriber Manager user data that you later import to User Management in System Manager.

Perform this procedure on System Manager Release 6.2 or later.

### Procedure

1. Log in to the primary CS 1000 UCM server command line using one of the following user names:
  - For CS 1000 Release 7.5 systems, admin2
  - For CS 1000 Release 7.0 and later systems, nortel
2. On the CS 1000 Release 7.x UCM server, perform the steps outlined in Preparing the Subscriber Manager user data for import to User Management in System Manager.
3. Change to super user su - root.
4. Type `cd /opt/nortel/cnd`.
5. Type `./cnd.sh stop_service`.
6. Type `./slapcat -f slapd.conf -s ou=subscribers,dc=nortel,dc=com -a objectclass=nortelsubscriber -l subscriberData.ldif`.
7. Type `./cnd.sh start_service`.
8. Using a secure ftp client, connect to the CS 1000 UCM Linux system using the same credentials you used in Step 1.
9. Copy the `/opt/nortel/cnd/subscriberData.ldif` file to your computer.

## Importing the CS 1000 UCM Subscriber Manager user data to System Manager

### Before you begin

Prepare the CS 1000 Release 7.x Subscriber Manager user data for import to System Manager User Management.

### Procedure

1. Using a secure ftp client, connect to the System Manager server using admin.
2. Copy the `subscriberData.ldif` file to the `/home/admin` directory on System Manager.
3. Log on to System Manager server using the command line interface.
4. Change to the super user su - root.
5. Type `cd /opt/nortel/cnd`.
6. Type `mv /home/admin/subscriberData.ldif`.

7. Type `./cnd.sh stop_service`.
8. Type `./slapadd -f slapd.conf -l subscriberData.ldif -c`.
9. Type `./cnd.sh start_service`.
10. Perform the LDAP synchronization procedure as outlined in Importing the Subscriber Manager user data to System Manager.

 **Note:**

Ensure that the **Host** field in the **Directory Parameter** area displays localhost.

## Managing messaging

---

### Messaging Class Of Service

A Class Of Service (COS) is a set of messaging capabilities that you define and assign to subscribers. The Class Of Service page lists the current name and number of the different Classes Of Service. You can only view the COS names and numbers on this screen; you cannot use this screen to change the COS names or numbers.

---

### Viewing Class Of Service

#### Procedure

1. On the System Manager web console, click **Elements > Messaging**.
2. Click **Class Of Service** in the left navigation pane.

3. Choose one or more messaging systems from the Messaging Systems list.
4. Click **Show List**.
5. Click the respective column heading to sort the Class Of Service by **Name** in alphabetical order or by **Class No.** in numeric order.

This is a read-only list.

---

## Class of Service List field descriptions

| Name                    | Description                                                    |
|-------------------------|----------------------------------------------------------------|
| <b>Class No</b>         | The number of each class of service.                           |
| <b>Name</b>             | The name of the class of service.                              |
| <b>Last Modified</b>    | The time and date when the class of service was last modified. |
| <b>Messaging System</b> | The type of messaging system.                                  |

---

## Messaging

### Subscriber Management

With System Manager, you can perform messaging system administration activities, such as add, view, edit, and delete subscribers. You can also administer mailboxes, and modify mailbox settings for a messaging system.

System Manager supports:

- Communication Manager 5.0 and later and
- Avaya Aura® Messaging 6.0 and later

### Adding a subscriber

#### Procedure

1. On the System Manager web console, click **Elements > Messaging**.
2. Click **Subscriber** in the left navigation pane.
3. Select one or more messaging systems from the list of Messaging Systems.
4. Click **Show List**.
5. Click **New**.
6. Complete the **Basic Information**, **Subscriber Directory**, **Mailbox Features**, **Secondary Extensions**, and **Miscellaneous** sections.
7. Complete the **Add Subscriber** page and click **Commit** to add the subscriber.

 **Note:**

If you select more than one Messaging or Modular Messaging from the list of messaging systems, and then click **New**, the system displays the Add Subscriber page with the first Messaging or Modular Messaging in context.

## Editing a subscriber

### Procedure

1. On the System Manager web console, click **Elements > Messaging**.
2. Click **Subscriber** in the left navigation pane.
3. Select a messaging system from the list of Messaging Systems.
4. Click **Show List**.
5. From the Subscriber List, choose the subscriber you want to edit.
6. Click **Edit** or **View > Edit**.
7. Edit the required fields in the **Edit Subscriber** page.
8. Click **Commit** to save the changes.

## Viewing a subscriber

### Procedure

1. On the System Manager web console, click **Elements > Messaging**.
2. Click **Subscriber** in the left navigation pane.
3. Select a messaging system from the list of Messaging Systems.
4. Click **Show List**.
5. Select the subscriber you want to view from the Subscriber List.
6. Click **View**.

 **Note:**

You cannot edit any field on the View Subscriber page.

## Deleting a subscriber

### Procedure

1. On the System Manager web console, click **Elements > Messaging**.
2. Click **Subscriber** in the left navigation pane.
3. Select a messaging system from the list of Messaging Systems.
4. Click **Show List**.
5. Select the subscriber you want to delete from the Subscriber List.
6. Click **Delete**.

The system displays a confirmation page for deleting the subscriber.

7. Confirm to delete the subscriber or subscribers.

 **Note:**

You cannot delete a subscriber associated with a user through mailbox management. You can delete the user associated subscribers only through User Profile Management.

## Subscriber list

The subscriber list displays all subscribers in a messaging version, such as Messaging, Communication Manager Messaging, or Modular Messaging. You can apply filter to each column in the subscriber list. You can also sort subscribers according to each of the column in the subscriber list. You must refresh the page to view the information that is updated after the last synchronization.

| Name                    | Description                                                       |
|-------------------------|-------------------------------------------------------------------|
| <b>Name</b>             | The name of the subscriber.                                       |
| <b>Mailbox Number</b>   | The mailbox number of the subscriber.                             |
| <b>Email Handle</b>     | The email handle of the subscriber.                               |
| <b>Telephone Number</b> | The telephone number of the mailbox.                              |
| <b>Last Modified</b>    | The time and date when the subscriber details were last modified. |
| <b>User</b>             | The name of the user to which the subscriber is associated.       |
| <b>System</b>           | The messaging system of the subscriber.                           |

## Filtering subscribers

### Procedure

1. On the System Manager web console, click **Elements > Messaging**.
2. Click **Subscriber** in the left navigation pane.
3. Select a messaging system from the list of Messaging Systems.
4. Click **Show List**.
5. Click the **Filter: Enable** option in the Subscriber List.
6. Filter the subscribers according to one or multiple columns.
7. Click **Apply**.

To hide the column filters, click **Disable**. This does not clear any filter criteria that you have set.

 **Note:**

The table displays only those subscribers that match the filter criteria.

## Subscribers (Avaya Aura® Messaging) field descriptions

| Name                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System</b>           | The name of the messaging system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Template</b>         | The messaging template of a subscriber template.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Last Name</b>        | The last name of the subscriber.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>First Name</b>       | The first name of the subscriber.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Mailbox Number</b>   | <p>The full mailbox number of a subscriber, including the site group and site identifiers, and the short mailbox number. Subscribers use mailbox numbers to log on to their respective mailbox. For a PBX subscriber, the mailbox number ranges from 3 to 10 digits in length. Other local subscribers use this field to address messages to the PBX subscriber. For a Multisite system subscriber, the mailbox number is up to 50 digits in length.</p> <p>Ensure that the mailbox number is:</p> <ul style="list-style-type: none"> <li>• Within the range of mailbox numbers assigned to your system.</li> <li>• Unassigned to another local subscriber.</li> <li>• A valid length on the local computer.</li> </ul> <p>This is a mandatory field on the Add Subscriber pages for all types of messaging systems.</p> |
| <b>Password</b>         | <p>The default password the subscriber must use to log in to the mailbox.</p> <p>The password can be from 3 to 15 digits and adhere to system policies set on the Avaya Aura® Messaging server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Save as Template</b> | Saves your current settings as a template.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Basic Information

| Name                         | Description                                                                                                                                                                                                                                                   |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Class Of Service Name</b> | <p>The name of the class of service (CoS) for this subscriber.</p> <p>CoS controls subscriber access to many features and provides general settings, such as mailbox size. The value that you select must be available in the messaging system.</p>           |
| <b>Community ID</b>          | <p>The default community ID for the subscriber. Community IDs are used to control message sending and receiving among groups of subscribers. The default value is 1.</p>                                                                                      |
| <b>Numeric Address</b>       | <p>The unique address in the voice mail network. The numeric address can be from 1 to 50 digits and can contain the Mailbox Number.</p>                                                                                                                       |
| <b>Time zone</b>             | <p>The time zone for Avaya Aura® Messaging time subscribers.</p> <p>The value must be in the standardized name format, America/Phoenix. Otherwise, the system sets the Avaya Aura® Messaging subscriber time zone to the System Manager server time zone.</p> |

*Table continues...*

| Name                 | Description                                                                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PBX Extension</b> | The primary telephone extension of the subscriber. For a Multisite system subscriber, this number is up to 50 digits in length.                             |
| <b>Site</b>          | The name of the site. Avaya Aura® Messaging includes a site named <b>Default</b> . Change the default name when you set site properties for the first time. |

### Subscriber Directory

| Field                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Email Handle</b>                        | The name that the system displays before the computer name and domain in the subscriber's email address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Telephone Number</b>                    | The telephone number of the subscriber as displayed in address book listings and client applications. The entry can be a maximum of 50 characters in length and can contain any combination of digits (0-9), period (.), hyphen (-), plus sign (+), and left and right parentheses (()) and ().                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Common Name</b>                         | The display name of the subscriber in address book listings, such as those for email client applications. The name can be 1 to 64 characters in length. This field is automatically populated when you add a new subscriber.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>ASCII version of name</b>               | If the subscriber name is entered in multi-byte character format, then this field specifies the ASCII translation of the subscriber name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Pronounceable Name</b>                  | <p>The pronounceable name of the user.</p> <p>The name of a user, info mailbox, or distribution list might not follow the pronunciation rules of the primary language for your system. To increase the likelihood of the Speech Recognition feature recognizing the name, spell the name as you would pronounce the name.</p> <p>For example, if the primary language of your system is English, spell Dan DuBois as Dan Doobwah. You can enter an alternative name for the user. For example, William Bell might also be known as Bill Bell. If you enter William in the First name field, Bell in the Last name field, and Bill Bell in the Pronounceable name field, the speech engine recognizes both William Bell and Bill Bell.</p> |
| <b>Include in Auto Attendant directory</b> | The option to add the messaging system to the auto attendant directory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Subscriber Security

| Name                   | Description                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Expire Password</b> | <p>An option to set the password expiry. The options are:</p> <ul style="list-style-type: none"> <li>• <b>yes</b>: for password to expire</li> <li>• <b>no</b>: if you do not want your password to expire</li> </ul> |

| Name                      | Description                                                                                                                                                                                                                                                                                    |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Is Mailbox Locked?</b> | <p>The option to lock your mailbox. A subscriber mailbox can get locked after two unsuccessful login attempts. The options are:</p> <ul style="list-style-type: none"> <li>• <b>no</b>: To unlock your mailbox</li> <li>• <b>yes</b>: To lock your mailbox and prevent access to it</li> </ul> |

## Mailbox Features

| Name                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Personal Operator Mailbox</b>  | The mailbox number or transfer dial string of the subscriber's personal operator or assistant. This field also indicates the transfer target when a caller to this subscriber presses 0 while listening to the subscriber greeting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Personal Operator Schedule</b> | The option to specify when to route calls to the backup operator mailbox. The default value is <b>Always Active</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>TUI Message Order</b>          | <p>The order in which the subscriber hears the voice messages. The options are:</p> <ul style="list-style-type: none"> <li>• <b>urgent first then newest</b>: to direct the system to play any messages marked as urgent prior to playing non-urgent messages. Both the urgent and non-urgent messages are played in the reverse order of how they were received.</li> <li>• <b>oldest messages first</b>: to direct the system to play messages in the order they were received.</li> <li>• <b>urgent first then oldest</b>: to direct the system to play any messages marked as urgent prior to playing non-urgent messages. Both the urgent and non-urgent messages are played in the order of how they were received.</li> <li>• <b>newest messages first</b>: to direct the system to play messages in the reverse order of how they were received.</li> </ul> |
| <b>Intercom Paging</b>            | <p>The intercom paging settings for a subscriber. The options are:</p> <ul style="list-style-type: none"> <li>• <b>paging is off</b>: Disables intercom paging for this subscriber.</li> <li>• <b>paging is manual</b>: Callers can page the subscriber with Subscriber Options or TUI if the subscriber can modify.</li> <li>• <b>paging is automatic</b>: Callers automatically page the subscriber with TUI.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                          |

*Table continues...*

| Name                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VoiceMail Enabled</b> | <p>The option to specify if a subscriber can receive messages, email messages, and call-answer messages from other subscribers. The options are:</p> <ul style="list-style-type: none"> <li>• <b>yes</b>: To create, forward, and receive messages.</li> <li>• <b>no</b>: To prevent the subscriber from receiving call-answer messages and to hide the subscriber from the telephone user interface (TUI). The subscriber cannot use TUI to access the mailbox, and other TUI users cannot address messages to the subscriber.</li> </ul> |
| <b>MWI enabled</b>       | <p>The option to enable the message waiting indicator (MWI) light feature. The options are:</p> <ul style="list-style-type: none"> <li>• <b>No</b>: The user has a voice mailbox only.</li> <li>• <b>ByCOS</b>: CoS controls how the system enables MWI. The <b>MWI enabled</b> field overrides the MWI setting defined by the CoS to which the user is associated.</li> </ul>                                                                                                                                                             |

## Secondary Extensions

| Field                      | Description                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Secondary Extension</b> | <p>One or more alternate number to reach a subscriber. You can use secondary extensions to specify a telephone number for direct reception of faxes, to allow callers to use an existing Caller Application, or to identify each line appearance on the subscriber's telephone set if they have different telephone numbers.</p> <p>For Avaya Aura® Messaging 6.3, you can add a maximum eight secondary extensions.</p> |

## Miscellaneous

| Field                  | Description                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Miscellaneous 1</b> | Useful information about a subscriber template. The messaging system does not use this information. Entries in this field are for convenience and are not used by the messaging system. |
| <b>Miscellaneous 2</b> | Useful information about a subscriber template. The messaging system does not use this information. Entries in this field are for convenience and are not used by the messaging system. |
| <b>Miscellaneous 3</b> | Useful information about a subscriber template. The messaging system does not use this information. Entries in this field are for convenience and are not used by the messaging system. |
| <b>Miscellaneous 4</b> | Useful information about a subscriber template. The messaging system does not use this information. Entries in this field are for convenience and are not used by the messaging system. |

| Button                | Description                    |
|-----------------------|--------------------------------|
| <b>Commit</b>         | Saves all the changes.         |
| <b>Edit</b>           | Allows you to edit the fields. |
| <b>Reset or Clear</b> | Clears all changes.            |
| <b>Cancel</b>         | Returns to the previous page.  |

# Chapter 10: Managing Communication Manager

---

## System Manager Communication Manager capabilities

System Manager provides a common, central administration of some IP Telephony products. This helps you to consolidate the key capabilities of the current suite of Integrated Management administration products with other Avaya Management tools on a common software platform. System Manager helps you administer Avaya Aura® Communication Manager, Communication Manager Messaging, Modular Messaging, Avaya Aura® Messaging. Some features of System Manager include:

- Endpoint management
- Template management
- Mailbox management
- Inventory management
- Element cut through to native administration screens

### Managing Communication Manager objects

System Manager displays a collection of Communication Manager objects under **Communication Manager**. From System Manager, you can add, edit, view, or delete the objects through **Communication Manager**.

### Endpoint management

Using endpoint management, you can create and manage endpoint objects, and add, change, remove, and view the endpoint data.

### Templates

Using Templates, you can specify specific parameters of an endpoint or a subscriber once and then reuse the template for subsequent add endpoint or subscriber tasks. You can use default templates or add your own custom templates.

There are two categories of templates: default templates and user-defined templates. You cannot edit or delete the default templates. However, you can modify or remove user-defined templates at any time.

### Subscriber management

Using Subscriber Management, you can manage, add, change, remove, and view subscriber data. Subscriber management supports Avaya Aura® Messaging, Communication Manager Messaging, and Messaging objects.

With System Manager Communication Manager capabilities, you can:

- Add Communication Manager for endpoints and Modular Messaging for subscribers to the list of managed elements.
- Create templates to simplify endpoint and subscriber management.
- Administer endpoints, subscribers, and create user profiles with communication profiles.
- Associate user profiles with the required endpoints and subscribers.

---

## Configuring Communication Manager user profile settings

Some Communication Manager capabilities depend on the license file available with the customers. For a successful functioning of Communication Manager capabilities, ensure that the following settings are in place:

### Procedure

1. Log in to Communication Manager SAT as a customer super-user.
2. Execute the `display system-parameters customer-options` command.
3. On Page 5, ensure that **Station and Trunk MSP?** is set to **y**.
4. Execute the `duplicate user-profile18` command.
5. On Page 1, perform the following:
  - a. Enter a new profile number. The profile number can range from 20 to 69.
  - b. Set **Shell Access** to **y**.
6. On Page 31, set **station M** to **wm**.
7. Save the user profile settings.
8. Exit Communication Manager SAT.
9. Open Communication Manager shell and perform the following to create a new user and assign password to the new user:
  - a. To create a new user, use the `cmuseradd <type> [-C profile] <login name>` command  
 where,
    - `<type>` is the super-user.
    - `profile` is the profile number created in Step 5.
    - `<login name>` is the user login name.
 For example, `cmuseradd super-user -C 20 iptuser`.
  - b. To assign password to the new user, use the command `cmpasswd <login name>`

where, *<login name>* is the login name in step 9a. For example, `cmpasswd`  
`iptuser`.

 **Note:**

You can also execute Step 9 from the **Administrator Accounts** Web page in Communication Manager SMI. The navigation path for **Administrator Accounts** Web page in Communication Manager SMI is **Administration > Server Maintenance > Security > Administrator Accounts**.

---

## Editing the Select All attribute in a table

### Procedure

1. On the System Manager web console, click **Services > Configurations**.
2. Click **Settings > Communication System Management > Configuration**.
3. On the View Profile: Configuration page, edit the value of the **Select All** attribute.

This setting affects all the tables in the user interface.

The default value for the **Select All** attribute is 1000. You can increase this value up to 5000.

---

## Search component for Communication Manager objects

System Manager supports data and link search for certain Communication Manager objects. Use the search bar on the Communication Manager objects list page for the following Communication Manager objects:

- Endpoints
- Agents
- Vector Directory Number (VDN)
- Vector
- Vector Routing Table (VRT)
- Announcement
- Audio Group
- Hunt Group
- Off PBX Endpoint Mapping
- Data Module

- Communication System
- Trunk Group
- Signaling Groups

Link based search: When you hover your mouse on the search bar, the system lists the Communication Manager objects that support search. Click a Communication Manager object to go to the relevant page directly. For example, if you click Hunt Group from the search bar, you can directly view the Hunt Group page.

Data search: Free text search and specific search are both supported in the search feature. If you type `Endpoints 100`, the system displays the endpoint with the extension 100. When you hover your mouse on this extension, a pop up window appears by the side. From this window, you can view certain details of the endpoint and directly go to the view, edit, and delete pages for the endpoint.

If you type the name of a Communication Manager object followed by space, the system lists all the searchable fields for the particular CM object. You can click a particular field and use the search option for that field.

The following table lists the fields that are searchable for the supported Communication Manager objects:

| Communication Manager object | Searchable fields                                                                                                                                              | Supported Actions  |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| Endpoint                     | Name, Extension, Port, Set Type, TN, Location, IP soft phone, COS, COR, User, Communication Manager name, Emergency Location Extension, Message Lamp Extension | View, Edit, Delete |
| Agent                        | Extension, Name, AAS, Call Handling Preference, COR, User, Coverage Path, Communication Manager name                                                           | View, Edit, Delete |
| VDN                          | Extension, Name, Destination, Allow VDN Override, Attendant, Vectoring, Meet-me Conferencing, COR, TN, Communication Manager name                              | View, Edit, Delete |
| Vector                       | Number, Name, Multimedia Attendant, Vectoring, Meet-me Conf, Communication Manager name                                                                        | View, Edit         |
| VRT                          | Number, Name, Sort, Communication Manager name                                                                                                                 | View, Edit, Delete |
| Announcement                 | Name, Extension, Group/Board, Type, Protected, Rate, COR, TN, Queue Size, Communication Manager name                                                           | View, Edit, Delete |
| Audio Group                  | Group Number, Group Name, Communication Manager name                                                                                                           | View, Edit, Delete |

*Table continues...*

| Communication Manager object | Searchable fields                                                                 | Supported Actions  |
|------------------------------|-----------------------------------------------------------------------------------|--------------------|
| Hunt Group                   | Group Number, Group Name, Group Extension, Group Type, Communication Manager name | View, Edit, Delete |

 **Note:**

You must have at least View permission for a Communication Manager object to use the search component for that Communication Manager object.

When you search a Communication Manager object, the system also displays the search results for other Communication Manager objects which support the search feature.

---

## Managing Communication Manager objects

---

### Communication Manager objects

System Manager displays a collection of Communication Manager objects under **Communication Manager**. Through **Communication Manager** you can directly add, edit, view, or delete the Communication Manager objects.

 **Note:**

To manage the Communication Manager objects not identified here, access the Communication Manager Element Cut-Through which provides an enhanced System Access Terminal (SAT) interface. To launch Element Cut-Through, click **Inventory > Synchronization > Communication System**.

The Communication Manager objects you can administer through System Manager are:

| Group       | Communication Manager objects                                                                                                                                                      |

 **Note:**

You cannot add, edit, or delete Audio Groups, Announcements, Subscribers, and Class of Service objects through Element Cut Through.

## Export function of Communication Manager objects

When you export the selected object or all objects, System Manager exports the objects in an excel sheet.

Note the following points:

- The Excel sheet has hyperlink limit of 65530. If the hyperlinks in the exported excel sheet exceeds from the provided limit, System Manager stops adding new hyperlinks. To maintain consistency, the font size is same for the text where hyperlink is applicable and even if hyperlink is not added.
- The Excel sheet has row limit of 1048576. If this limit is reached while exporting data on any sheet, System Manager creates a new file and continues exporting the data in the new Excel sheet. Once all data is exported, all the excel files are merged in a zip. So, if there are more than one Excel files then the Export Job list provides link to the zip file. Otherwise, System Manager provides the direct excel download.

## Adding Communication Manager objects

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. Select the Communication Manager object.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **New**.
6. Select the Communication Manager again from the list of Communication Managers.

 **Note:**

Enter the qualifier number in the **Enter Qualifier** field, if applicable.

7. Click **Add**.

The system displays the Element Cut Through screen where you can enter the attributes of the Communication Manager object you want to add.

8. Click **Enter** to add the Communication Manager object.

To return to the Communication Manager screen, click **Cancel**.

## Editing Communication Manager objects

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. Select the Communication Manager object.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the group list, select the device you want to edit.
6. Click **Edit**.

The system displays the Element Cut Through screen where you can edit the attributes of the device you have chosen.

7. To save the changes and go back to the Communication Manager screen, click **Enter**.

To undo the changes and return to the Communication Manager screen, click **Cancel**.

## Viewing Communication Manager objects

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. Select the Communication Manager object.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the group list, select the object you want to view.
6. Click **View**.

You can view the attributes of the object you have selected in the Element Cut Through screen.

7. To return to the Communication Manager screen, click **Cancel**.

## Deleting Communication Manager objects

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. Select the Communication Manager object.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.

5. Select the objects you want to delete from this group.
6. Click **Delete**.
7. Confirm to delete the Communication Manager objects.

## Filtering Communication Manager objects

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. Select the Communication Manager object.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **Filter: Enable** in the group list.
6. Filter the Communication Manager objects according to one or multiple columns.
7. Click **Apply**.

To hide the column filters, click **Disable**. This action does not clear any filter criteria that you have set.

#### **Note:**

The table displays only those devices that match the filter criteria.

## Changing to classic view

The System Manager Web interface of Communication Manager objects support two types of views: classic and enhanced. Enhanced view is the default setting, where you can execute tasks on the Web interface. In the classic view, the system directs you to Element Cut Through screen for executing the tasks.

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. Select the Communication Manager object you want to manage.
3. By default, the system displays the Web page for the Communication Manager object in enhanced view. To change to classic view, click the **Switch to Classic View** link on the upper-right of the interface.
4. To return to the default view, click the **Switch to Enhanced View** link.

---

## Agents

### Agents

Use the Agents capability to manage agent login IDs and skill assignments in an Expert Agent Selection (EAS) environment. If skills are added or changed, agents must log out and then log in again before the changes are effective.

### Agents List

Agents List displays all the agents under the Communication Manager you select. You can perform an advanced search on this list using the search criteria. You can also apply filters and sort each column in the Agents List.

When you click **Refresh**, you can view the updated information available after the last synchronization operation.

| Name                            | Description                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------|
| <b>LoginID</b>                  | The identifier for the Logical Agent as entered in the command line.                              |
| <b>Agent Name</b>               | The 27-character string name of the agent. Any alphanumeric character is valid. Default is blank. |
| <b>Direct Agent Skill</b>       | The number of the skill used to handle Direct Agent calls.                                        |
| <b>Call Handling Preference</b> | The call that an agent receives the next when calls are in queue.                                 |
| <b>COR</b>                      | The Class of Restriction associated with the agent.                                               |
| <b>System</b>                   | The name of the Communication Manager associated with the agents.                                 |

### Adding an agent

#### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Agents**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **New**.
6. From **Template**, select the template.
7. In **Login ID**, perform one of the following:
  - Type the extension number.
  - Click the **Display Extension Ranges** link to select the extension number from the available extension ranges.
8. Complete the New Agent page and click **Commit**.

**Deleting agents in bulk****Procedure**

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Agents**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Bulk Delete Agents**.
6. Perform one of the following actions:
  - Select the agents you want to delete in bulk from the **Current Agent Extensions** field.
  - Type the agent extensions you want to bulk delete in the **Enter Extensions** field.
7. Click **Continue**.
8. On the Bulk Delete Agents Confirmation page, click **Now**.  
Click **Schedule** to schedule the bulk delete job at a later time.

 **Note:**

You cannot delete agent associated extensions.

**Exporting selected agent****Procedure**

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Agents**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. From the **Agent List**, select the agent you want to export.
6. Click **More Actions > Export Selected Agents**.  
The system displays the **Export AgentLoginIds** page.
7. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
8. Click **Export**.

System Manager displays the status of the exported job in the **Status** column of the Export Jobs List section.

## Exporting all agents

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Agents**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Export All Agents**.

The system displays the **Export All AgentLoginIds** page.

6. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.
7. Click **Export**.

System Manager displays the status of the exported job in the **Status** column of the Export Jobs List section.

## Importing agents

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Agents**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Import Agents**.

The system displays the **Import CM Objects** page.

6. In the **Select a file** field, click **Browse** to select the required excel file.
7. In the **Select Error Configuration** field, select one of the following.

The default option is **Continue processing other records**.

- **Abort on first error**
- **Continue processing other records**

8. In the **If a matching record already exists** field, select one of the following:

The default option is **Skip**.

- **Skip**
- **Merge**
- **Delete**

9. In the **Schedule Job** field, click **Run immediately** or **Schedule later**.

10. Click **Import**.

System Manager displays the status of the imported job in the **Status** column of the Import Jobs List section.

## Downloading Excel Template

### Procedure

1. On the System Manager web console, click **Elements > Communication Manager**.
2. In the navigation pane, click **Call Center > Agents**.
3. Select one or more Communication Manager instance from the Communication Manager list.
4. Click **Show List**.
5. Click **More Actions > Download Excel Template**.
6. In the **Opening <Excel template file name>.xlsx** dialog box, click **Save**, and click **OK**.

System Manager saves the file on your local computer.

## Agents field descriptions

If you change the value of the fields from the systemparameters features screen of Communication Manager, agents must log out and log back in for the change to be reflected.

| Name                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Name</b>                      | The 27-character string name of the agent. Any alphanumeric character is valid. By default, this field is blank.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Attribute</b>                 | The agent attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>AAS</b>                       | <p>The option to use this extension as a port for an Auto Available Split/Skill. By default, this check box is clear. This option is intended for communication server adjunct equipment ports only, not human agents.</p> <p> <b>Important:</b></p> <p>When you enter <i>y</i> in the AAS field, it clears the password and requires execution of the <b>remove agent-loginid</b> command. To set AAS to <i>n</i>, remove this logical agent, and add it again.</p> |
| <b>ACW Agent Considered Idle</b> | The option to count After Call Work (ACW) as idle time. The valid entries are <b>System</b> , <b>Yes</b> , and <b>No</b> . Select <b>Yes</b> to include ACW agents in the Most-Idle Agent queue. Select <b>No</b> to exclude ACW agents from the queue.                                                                                                                                                                                                                                                                                                 |
