CATALOG

In 1916 L.R. Oatey founded his plumbing supply company in Cleveland, Ohio. Originally he sold one product, a lead roof flashing for venting plumbing pipes. The first flashings were all made from sheet lead. Our flashings progressed onto cast lead, followed by copper, galvanized and aluminum bases with poured lead collars.

POWER OF ONE

L.R. insisted that everything about that product, everything that represented the Oatey brand, was about quality in meeting our customers' needs. We have not strayed from that same commitment even though 100 years later, we have expanded operationally to become a global manufacturer of thousands of products.

Today, Oatey offers over 6,000 residential and commercial plumbing products through its six branded lines. After a century of incredible progress, Oatey has changed with the times, meeting the needs of its customers and manufacturing products designed to deliver quality, build trust and improve lives. Because of this evolution, Oatey is recognized today as a leading manufacturer of high quality plumbing products.

The last L.R. Oatey designed lead roof flashing (seen here) was produced by Oatey Co. on October 13, 2000, after which Oatey became a lead free company.

How to Solvent Weld

Prior to Use: Read all product labels carefully. Stir or shake cement before using. Replace if gelled. Keep container closed when not in use. Avoid eye and skin contact. Wear safety glasses with side shields and wear rubber gloves. For specialty cements and chemical applications, please see specific product label instructions.

1. Square pipe ends, chamfer and remove all dirt.
2. Check dry fit of pipe and fitting. Pipe should easily go 1/3 of the way into the fitting. If pipe bottoms, it should be snug.
3. Use a suitable applicator at least 1/2 the size of the pipe diameter. For larger size pipe systems, use a natural bristle brush or roller.
4. Clean pipe and fitting with a listed primer. (Do not use primer on ABS pipe and fittings. Use Clear Cleaner only!)
5. Apply liberal coat of cement to pipe to the depth of the socket, leave no uncoated surface.
6. Apply a thin coat of cement to inside of fitting, avoid puddling of cement. Puddling can cause weakening and premature failure of pipe or fitting. Apply a second coat of cement to the pipe.
7. Assemble parts QUICKLY. Cement must be fluid. If cement surface has dried, recoat both parts.
8. Push pipe FULLY into fitting using a 1/4 turning motion until pipe bottoms.
9. Hold pipe and fitting together for 30 seconds to prevent pipe push-out – longer at low temperatures. Wipe off excess.
10. Allow 15 minutes for good handling strength and 2 hours cure time at temperatures above 60°F. Longer cure times may be required at temperatures below 60°F or with pipe above 3". Do not pressure test until cement is fully cured. DO NOT TEST WITH AIR.

Pipe Types

CPVC: Chlorinated Poly Vinyl Chloride - Typically used for pressure piping applications, including hot and cold potable water distribution. Can also be used for corrosive fluid handling in industrial or chemical applications.

ABS: Acrylonitrile Butadiene Styrene - Typically used for non-pressure piping applications.

PVC: Poly Vinyl Chloride - Typically used for pressure or non-pressure piping applications.

Product Development

Oatey Solvent Cements are developed with the plumbing contractor in mind. Extensive research and product development provide you peace of mind and confidence when using Oatey brand solvent cements. In addition, no company works as hard as Oatey on behalf of the professional plumber with regulatory and coding agencies.

Solvent Cements for any Application

If you need to solvent weld one pipe joint or one thousand, Oatey is the solvent cement more professionals choose than any other brand. From hot to cold, wet to dry, Oatey has the solvent cement to meet your exact requirement for any plastic pipe installation.

Set Up/Curing Times

The set up/cure time is dependent on several factors. The pipe size, socket fit, ambient temperature, relative humidity, solvent cement used and the system operating pressure should all be considered when determining set up/cure times.

Average Handling/Set Up Times for PVC/CPVC Solvent Cements

Handling/Set Up Time is the time required prior to handling the joint. In damp or humid weather, allow 50% additional time.

These figures should only be used as a general guide. Conditions in the field may vary.

Contact Oatey Technical Services for set up times for pipe larger than 8" diameter.

Average Joint Cure Times for PVC/CPVC Solvent Cements

Joint cure time is the time required before pressure testing the system. In damp or humid weather allow 50% additional cure time.

This data is applicable only for new piping installations and not recommended for repair or cut-ins on hot and cold water distribution systems. Please contact Oatey Technical Service for recommendations on Cure Times for such applications. Do not test PVC and CPVC piping systems with compressed air or gas.

Notes: Cure schedule is the time required before pressure testing the system. This chart can be used as a guideline to determine joint cure. Cure times stated are for conditions with relative humidity of 60% or less. In damp or humid weather allow 50% additional cure time.
