

Please note that Cypress is an Infineon Technologies Company.

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

Continuity of document content

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

Continuity of ordering part numbers

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

This series is Cypress 32-bit microcontroller designed for automotive and industrial control applications. It contains the FR81S CPU that is compatible with the FR family. The FR81S has a high level performance among the Cypress FR family by enhancing CPU instruction pipeline and load store processing, and improving internal bus transfer.

It is best suited for application control for automotive.

Features

FR81S CPU Core

- 32-bit RISC, load/store architecture, 5-stage pipeline
- Maximum operating frequency: 80 MHz (Source oscillation = 4.0 MHz and 20 multiplied (PLL clock multiplication system))
- General-purpose register: 32-bit x16 sets
- 16-bit fixed length instructions (basic instruction), 1 instruction per cycle
- Instructions appropriate to embedded applications
 - Memory-to-memory transfer instruction
 - Bit processing instruction
 - Barrel shift instruction etc.
- High-level language support instructions
 - Function entry/exit instructions
 - Register content multi-load and store instructions
- Bit search instructions
 - Logical 1 detection, 0 detection, and change-point detection
- Branch instructions with delay slot
 - Decrease overhead during branch process
- Register interlock function
 - Easy assembler writing
- Built-in multiplier and instruction level support
 - Signed 32-bit multiplication: 5 cycles
 - Signed 16-bit multiplication: 3 cycles
- Interrupt (PC/PS saving)
 - 6 cycles (16 priority levels)
- The Harvard architecture allows simultaneous execution of program and data access.
- Instruction compatibility with the FR family
- Built-in memory protection function (MPU)
 - Eight protection areas can be specified commonly for instructions and the data.
 - Control access privilege in both privilege mode and user mode.
- Built-in FPU (floating point arithmetic)
 - IEEE754 compliant
 - Floating-point register 32-bit x 16 sets

Peripheral Functions

- Clock generation (equipped with SSCG function)
 - Main oscillation (4 MHz)
 - Sub oscillation (32 kHz) or no sub oscillation
 - PLL multiplication rate: 1 to 20 times
- Built-in Program flash memory capacity
 - CY91F575: 512 + 64 KB
 - CY91F577: 1024 + 64 KB
 - CY91F578: 1536 + 64 KB
 - CY91F579: 2048 + 64 KB
- Built-in Data flash memory (WorkFlash) capacity 64 KB
- Built-in RAM capacity
 - Main RAM
 - CY91F575: 40 KB
 - CY91F577: 64 KB
 - CY91F578: 96 KB
 - CY91F579: 128 KB
 - Backup RAM
 - CY91F575/7: 8 KB
 - CY91F578/9: 16 KB
- General-purpose ports
 - [LQFP-144]**
 - 111 (none sub oscillation), 109 (with sub oscillation)
 - Included I²C pseudo open drain ports: 4
 - P057: Input only
 - [LQFP-208]**
 - 159 (none sub oscillation), 157 (with sub oscillation)
 - Included I²C pseudo open drain ports: 4
 - P057: Input only
- External bus interface
 - 22-bit address, 16-bit data
 - 23 pins of 9-bit address, 8-bit data, ASX, CS0X, CS1X, RDX, WR0X, and WR1X can select 5V/3.3V by the VCCE power supply
- DMA Controller
 - Up to 16 channels can be started simultaneously.
 - 2 transfer factors (Internal peripheral request and software)

- A/D converter (successive approximation type)
 - 8/10-bit resolution: 40 channels
 - Conversion time: 3 μ s
- D/A converter (R-2R type)
 - 8-bit resolution: 2 channels
- External interrupt input: 16 channels
 - Level ("H" / "L"), or edge detection (rising or falling) enabled
- LIN-UART
 - 6 channels, ch.2 to ch.7
 - Selectable from UART, synchronous mode or LIN-UART mode
 - LIN protocol Revision 2.1 supported (LIN-UART).
 - SPI (Serial Peripheral Interface) supported (synchronous mode)
 - Full-duplex double buffering system
 - LIN synch break detection (linked to the input capture)
 - Built-in dedicated baud rate generator
 - DMA transfer support
- Multi-function serial communication (built-in transmission/reception FIFO memory): 4 channels

< UART (Asynchronous serial interface) >

- Full-duplex double buffering system, 16-byte transmission FIFO memory, 16-byte reception FIFO memory
- Parity or no parity is selectable.
- Built-in dedicated baud rate generator
- The external clock can be used as the transfer clock
- Parity, frame, and overrun error detect functions provided
- DMA transfer support

< CSIO (Synchronous serial interface) >

- Full-duplex double buffering system, 16-byte transmission FIFO, memory, 16-byte reception FIFO memory
- SPI supported; master and slave systems supported; 5 to 9-bit data length can be set.
- Built-in dedicated baud rate generator (Master operation)
- The external clock can be entered. (Slave operation)
- Overrun error detection function is provided
- DMA transfer support

< LIN-UART (Asynchronous Serial Interface for LIN) >

- Full-duplex double buffering system, 16-byte transmission FIFO memory, 16-byte reception FIFO memory
- LIN protocol revision 2.1 supported
- Master and slave systems supported
- Framing error and overrun error detection
- LIN synch break generation and detection; LIN synch delimiter generation
- Built-in dedicated baud rate generator
- The external clock can be adjusted by the reload counter
- DMA transfer support

< I²C >

- Full-duplex double buffering system, 16-byte transmission FIFO memory, 16-byte reception FIFO memory
- Standard mode (Max. 100kbps) / high-speed mode (Max. 400kbps) supported
- DMA transfer supported (for transmission only)
- I²C supporting I/O (for ch.0 and ch.1 only)
- CAN Controller (C-CAN): 3 channels
 - Transfer speed: Up to 1 Mbps
 - 64-transmission/reception message buffering: 1 channel, 32-transmission/reception message buffering: 2 channels
- PPG: 16-bit \times 24 channels
- Reload timer: 16-bit \times 7 channels (3 channels are for regular timer interrupt generation.)
- Free-run timer:
 - 32-bit \times 6 channels (Can select each channel for input capture, output compare)
- Input capture:
 - 32-bit \times 12 channels (linked to the free-run timer)
- Output compare: 32-bit \times 12 channels (linked to the free-run timer)
- Sound generator: 5 channels
 - Frequency and amplitude sequencers provided
- Stepping motor controller: 6 channels
 - 8/10-bit PWM
 - High current output supported (4 lines \times 6 channels)
 - Can refer back electromotive force using pin-shared A/D converter
- LCD controller
 - Common output: 4, Segment output: 32
 - Duty drive (SEG0 to SEG31) and static drive (ST0 to ST8) can be switched.
 - Each of COM0 to COM3, SEG0 to SEG31, V0, V1, V2, and V3 pins for duty drive can be switched to the general-purpose port. (The SEG23 to SEG31 pins can be switched to static driving.)
 - V0, V1, V2 and V3 pin can be used as the general-purpose port. But V3 pin cannot be used as an output pin.
 - Each of ST0 to ST8 pins for static drive can be switched to the general-purpose port, or it can be switched to the segment output of duty drive.
 - CY91F575/7: The amplitude of the SEG0 to SEG22 output is determined by the VCC5 power supply pin or by the V3 pin even if VCCE pin is supplied to 3.3 V.
 - CY91F578/9: The voltage VCCE or less can be supplied to V3 pin. It is prohibited that VCC5 being chosen as LCDC reference voltage by software.
- Up/Down counter: 2 channels
 - 8/16-bit up/down counter
- Real-time clock (RTC) (for day, hours, minutes, seconds)
 - Main oscillation / sub oscillation frequency can be selected for the operation clock

- Calibration: A hardware watchdog of the CR oscillation drive and real-time clock (RTC) of the sub clock drive
 - The CR oscillation frequency can be trimmed
 - The main clock to sub clock ratio can be corrected by setting the real-time clock prescaler
- Clock Supervisor
 - Monitoring abnormality (damage of crystal etc.) of sub oscillation (32 kHz) (dual clock products) and main oscillation (4 MHz)
 - When abnormality is detected, it switches to the CR clock.
- Base timer: 2 channels
 - 16-bit timer
 - Any of four PWM/PPG/PWC/reload timer functions can be selected and used.
 - As for the functions of PWC and reload timer, 2 channels of cascade mode can be used as 32-bit timer.
- CRC generation
- HS-SPI
 - Note:** In this series, the HS-SPI function is prohibited
 - E²PROM and the flash device of the Single/Dual/Quad-SPI protocol can be connected.
 - The power supply of 5V/3.3V supplied to the VCCE power supply pin is used.
 - Maximum 16 MHz (Maximum 8 MHz at the slave.)
- Watchdog timer
 - Hardware watchdog
 - Software watchdog
- NMI
- Interrupt controller
 - Interrupt request batch read
 - Multiple interrupts from peripherals can be read by a series of registers.
 - I/O relocation
 - Peripheral function pins can be reassigned.
 - Low-power consumption mode
 - Sleep / Stop / Watch / Sub RUN mode
 - Stop (power shutdown) / Watch (power shutdown) mode
 - Power on reset
 - Low-voltage detection reset (external low-voltage detection)
 - Low-voltage detection reset (internal low-voltage detection)
 - Device Package:
 - LQFP-144 for CY91F575/7/8/9
 - LQFP-208 for CY91F578/9
 - CMOS 90nm Technology
 - Power supplies
 - 5V Power supply
 - The internal 1.2 V is generated from 5 V with the voltage step-down regulator.
 - I/O port uses the power supply of 5V/3.3V supplied to the VCCE power supply pin.
 - LQFP-144: P010 to P017, P020 to P027, and P030 to P036
 - LQFP-208: P140 to P147, P150 to P157, P160 to P167, P170 to P177, P180 to P187, and P190 to P197

3. Pin Assignment (LQFP-208)

4. Pin Description (LQFP-144)

Pin Number	Pin Name	I/O Circuit Type	Function Description
2	P015	H/I4 ^{*1}	General-Purpose I/O Port
	D29_0		External Bus Data I/O pin
	SEG5		LCDC Segment(Duty)Output pin
	D21_1		External Bus Data I/O pin
	INT13_1		External Interrupt Request Input pin ch.13 relocation 1
3	P016	H/I4 ^{*1}	General-Purpose I/O Port
	D30_0		External Bus Data I/O pin
	SEG6		LCDC Segment(Duty)Output pin
	D22_1		External Bus Data I/O pin
	INT14_1		External Interrupt Request Input pin ch.14 relocation 1
4	P017	H/I4 ^{*1}	General-Purpose I/O Port
	D31_0		External Bus Data I/O pin
	SEG7		LCDC Segment(Duty)Output pin
	D23_1		External Bus Data I/O pin
	INT15_1		External Interrupt Request Input pin ch.15 relocation 1
5	P020	H/I4 ^{*1}	General-Purpose I/O Port
	ASX		External Bus Address-Strobe Output pin
	SEG8		LCDC Segment(Duty)Output pin
	ICU6_0		Input Capture Input pin ch.6 relocation 0
	OCU0_1		Output Compare Output pin ch.0 relocation 1
6	P021	H/I4 ^{*1}	General-Purpose I/O Port
	CS0X		External Bus Chip-Select 0 Output pin

	OCU11_0		Output Compare Output pin ch.11 relocation 0

Pin Number	Pin Name	I/O Circuit Type	Function Description
10	P025	H/I4 ¹¹	General-Purpose I/O Port
	WR1X		External Bus Write-Strobe 1 Output pin
	SEG13		LCDC Segment(Duty)Output pin
	ICU11_0		Input Capture Input pin ch.11 relocation 0
	OCU10_0		Output Compare Output pin ch.10 relocation 0
11	P026	H/I4 ¹¹	General-Purpose I/O Port
	A00		External Bus Address Output pin
	SEG14		LCDC Segment(Duty)Output pin
	SPI_CS3		HS_SPI SSEL3 Output pin (Not supported)
	SIN6_1		LIN_UART Serial Input pin ch.6 relocation 1
	OCU9_0		Output Compare Output pin ch.9 relocation 0
12	P027	H/I4 ¹¹	General-Purpose I/O Port
	A01		External Bus Address Output pin
	SEG15		LCDC Segment(Duty)Output pin
	SPI_CS2		HS_SPI SSEL2 Output pin (Not supported)
	SOT6_1		LIN_UART Serial Output pin ch.6 relocation 1
	OCU8_0		Output Compare Output pin ch.8 relocation 0
13	P030	H/I4 ¹¹	General-Purpose I/O Port
	A02		External Bus Address Output pin
	SEG16		LCDC Segment(Duty)Output pin
	SPI_CS1		HS_SPI SSEL1 Output pin (Not supported)
	SCK6_1		LIN_UART Serial Clock I/O pin ch.6 relocation 1
14	P031	H/I4 ¹¹	General-Purpose I/O Port
	A03		External Bus Address Output pin
	SEG17		LCDC Segment(Duty)Output pin
	SPI_CS0		HS_SPI SSEL0 I/O pin (Not supported)
	SIN9_0		Multi-function Serial Input pin ch.9 relocation 0
15	P032	H/I4 ¹¹	General-Purpose I/O Port
	A04		External Bus Address Output pin
	SEG18		LCDC Segment(Duty)Output pin
	SPI_SIO3		HS_SPI SDATA3 I/O pin (Not supported)
	SOT9_0		Multi-function Serial Output pin ch.9 relocation 0
	OCU7_0		Output Compare Output pin ch.7 relocation 0
16	P033	H/I4 ¹¹	General-Purpose I/O Port
	A05		External Bus Address Output pin
	SEG19		LCDC Segment(Duty)Output pin
	SPI_SIO2		HS_SPI SDATA2 I/O pin (Not supported)
	SCK9_0		Multi-function Serial Clock I/O pin ch.9 relocation 0
	OCU6_0		Output Compare Output pin ch.6 relocation 0

Pin Number	Pin Name	I/O Circuit Type	Function Description
17	P034	H/I4 ¹	General-Purpose I/O Port
	A06		External Bus Address Output pin
	SEG20		LCDC Segment(Duty)Output pin
	SPI_SIO1		HS_SPI SDATA1 I/O pin (Not supported)
	SIN8_0		Multi-function Serial Input pin ch.8 relocation 0
	OCU5_1		Output Compare Output pin ch.5 relocation 1
18	P035	H/I4 ¹	General-Purpose I/O Port
	A07		External Bus Address Output pin
	SEG21		LCDC Segment(Duty)Output pin
	SPI_SIO0		HS_SPI SDATA0 I/O pin (Not supported)
	SOT8_0		Multi-function Serial Output pin ch.8 relocation 0
	OCU4_1		Output Compare Output pin ch.4 relocation 1
19	P036	H/I4 ¹	General-Purpose I/O Port
	A08		External Bus Address Output pin
	SEG22		LCDC Segment(Duty)Output pin
	PPG11_0		PPG Output pin ch.11 relocation 0
	SPI_CLK		HS_SPI SCLK I/O pin (Not supported)
	SCK8_0		Multi-function Serial Clock I/O pin ch.8 relocation 0
22	P037	I	General-Purpose I/O Port
	A09		External Bus Address Output pin
	SEG23		LCDC Segment(Duty)Output pin
	ST0		LCDC Segment(Static)Output pin
	PPG12_0		PPG Output pin ch.12 relocation 0
	SIN7_0		LIN_UART Serial Input pin ch.7 relocation 0
23	P040	I	General-Purpose I/O Port
	A10		External Bus Address Output pin

7. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

7.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

1. Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

2. Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device. Therefore, avoid this type of connection.

3. Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

Latch-up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high-voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

1. Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
2. Be sure that abnormal current flows do not occur during the power-on sequence.

Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

7.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress' recommended conditions. For detailed information about mount conditions, contact your sales representative.

Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

1. Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
2. Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
3. When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
4. Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125°C/24 h

Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

1. Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
2. Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
3. Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
4. Ground all fixtures and instruments, or protect with anti-static measures.
5. Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

7.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

1. Humidity
Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.
2. Discharge of Static Electricity
When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.
3. Corrosive Gases, Dust, or Oil
Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.
4. Radiation, Including Cosmic Radiation
Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.
5. Smoke, Flame
CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

8. Handling Devices

This section explains the latch-up prevention and the treatment of a pin.

For Latch-up Prevention

If a voltage higher than VCC or a voltage lower than VSS is applied to an I/O pin, or if a voltage exceeding the ratings is applied between VCC pin and VSS pin, a latch-up may occur in CMOS IC. If the latch-up occurs, the power supply current increases excessively and device elements may be damaged by heat. Take care to prevent any voltage from exceeding the maximum ratings in device application.

Also, the analog power supply voltage (AVcc, AVRH), analog input, and the power supply voltage to high-current output buffer pins (DVcc), the power supply voltage of external bus interface (VccE) must not exceed the digital power supply voltage (Vcc5) when the power supply voltage to the analog system and high-current output buffer pins the power supply voltage of external bus interface (VccE) is turned on or off.

In the correct power-on sequence, turn on the digital power supply voltage (Vcc5), analog power supply voltage (AVcc, AVRH), the power supply voltage of external bus interface (VccE), and the power supply voltage of high-current output buffer pins (DVcc) simultaneously. Or, turn on the digital power supply voltage (Vcc5), and then turn on analog power supply voltage (AVcc, AVRH), the power supply voltage of external bus interface (VccE), and the power supply voltage of high-current output buffer pins (DVcc).

Treatment of Unused Pins

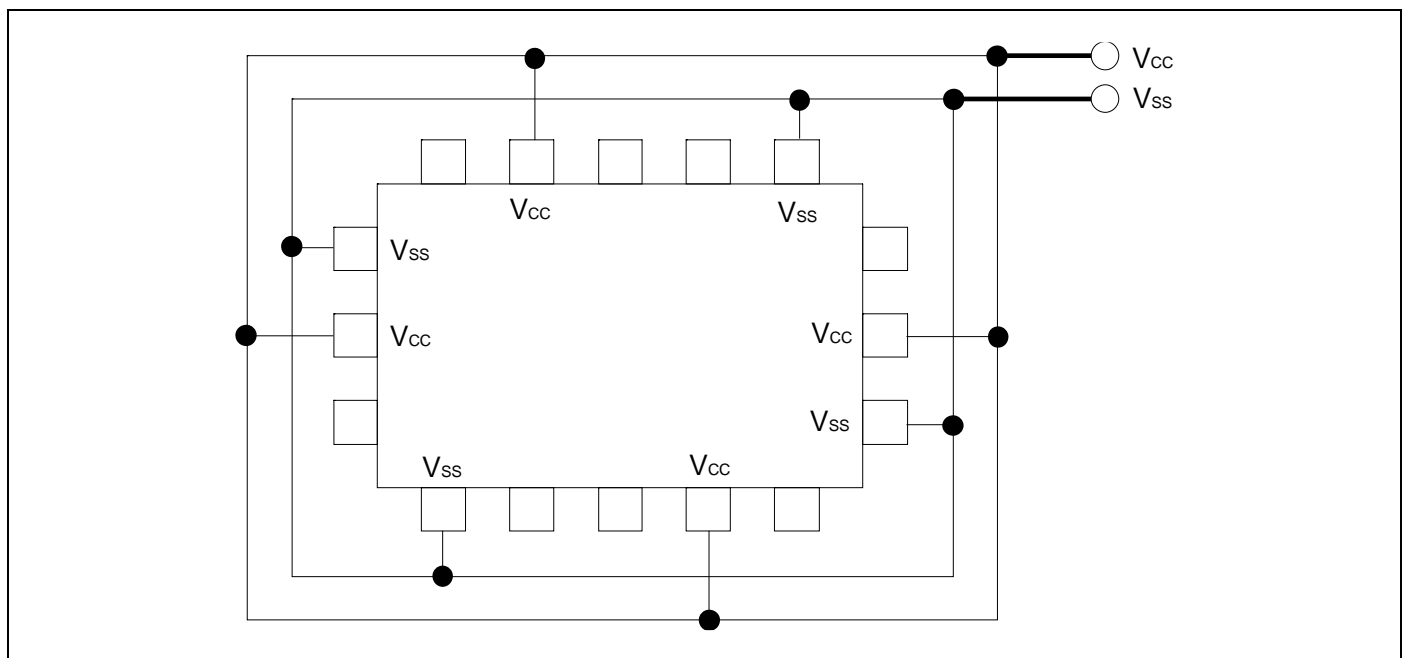

If unused input pins are left open, they may cause a permanent damage to the device due to malfunction or latch-up. Connect a 2kΩ resistor to each of unused pins for pull-up or pull-down connection.

Also, if I/O pins are not used, they must be set to the output state for opening or they must be set to the input state and treated in the same way as for the input pins.

Power Supply Pins

The device is designed to ensure that if the device contains multiple VCC pin or VSS pin, the pins that should be at the same potential are interconnected to prevent latch-up or other malfunctions. Further, connect these pins to an external power source or ground to reduce unwanted radiation, prevent strobe signals from malfunctioning due to a raised ground level, and fulfill the total output current standard, etc. As shown in figure 1, all Vss power supply pins must be treated in the similar way. If multiple Vcc or Vss systems are connected, the device cannot operate correctly even within the guaranteed operating range.

Figure 1. Power Supply Input Pins

The power supply pins should be connected to VCC pin and VSS pin of this device at the low impedance from the power supply source.

In the area close to this device, a ceramic capacitor having the capacitance larger than the capacitor of C pin is recommended to use as a bypass capacitor between the VCC pin and the VSS pin.

Crystal Oscillation Circuit

An external noise to the X0 pin or X1 pin may cause a device malfunction. The printed circuit board must be designed to lay out the X0 pin and the X1 pin, crystal oscillator (or ceramic resonator), and the bypass capacitor to be grounded to the close position to the device.

The printed circuit board artwork is recommended to surround the X0 pin and X1 pin by ground circuits.

Mode Pins (MD2, MD1, MD0)

Connect the MD2, MD1 and MD0 mode pin to the VCC pin or VSS pin directly. To prevent an erroneous selection of test mode caused by the noise, reduce the pattern length between each mode pin and VCC pin or VSS pin on the printed circuit board. Also, use the low-impedance pin connection.

During Power-on

To prevent a malfunction of the voltage step-down circuit built in the device, set the voltage rising time to have 50 μ s or longer (between 0.2V to 2.7V) during power-on.

Notes During PLL Clock Operation

When the PLL clock is selected and if the oscillator is disconnected or if the input is stopped, this clock may continue to operate at the free running frequency of the self-oscillator circuit built in the PLL clock. This operation is not guaranteed.

Treatment of A/D Converter Power Supply Pins

Connect the pins to have $AV_{CC} = AVR_{H} = V_{CC5}$ and $AV_{SS}/AV_{RL} = V_{SS}$ even if the A/D converter is not used.

Notes on Using External Clock

An external clock is not supported. None of the external direct clock input can be used for both main clock and sub clock.

Power-on Sequence of A/D Converter Analog Inputs

Be sure to turn on the digital power supply voltage (V_{CC}) first, and then turn on the A/D converter power supply voltage (AV_{CC} , AVR_{H} , AVR_{L}) and analog input voltage ($AN0$ to $AN39$). Also, turn off the A/D converter power supplies and analog inputs first, and then turn off the digital power supply voltage (V_{CC5}). When the AVR_{H} pin voltage is turned on or off, it must not exceed AV_{CC} . Even if a common analog input pin is used as an input port, its input voltage must not exceed AV_{CC} . (However, the analog power supply voltage and digital power supply voltage can be turned on or off simultaneously.)

Treatment of Power Supplies for High Current Output Buffer Pins (DV_{CC} , DV_{SS})

Be sure to turn on the digital power supply voltage (V_{CC}) first, and then turn on the power supply voltage for high current output buffer pins (DV_{CC} , DV_{SS}). Also, turn off the power supplies for high current output buffer pins first, and then turn off the digital power supply voltage (V_{CC}).

Even if the high current output buffer pins are used as general-purpose ports, the power supply voltage of high current output buffer pins (DV_{CC} , DV_{SS}) must be powered. (The power supplies of high current output buffer pins and the digital power supplies can be turned on or off simultaneously.)

Treatment of C Pin

This device contains a voltage step-down circuit. A capacitor must always be connected to the C pin to assure the internal stabilization of the device.

For the standard values, see the "Recommended Operating Conditions" of the latest data sheet.

Function Switching of a Multiplexed Port

To switch between the port function and the multiplexed pin function, use the PFR (port function register). However, if a pin is also used for an external bus, its function is switched by the external bus setting. For details, see "I/O Ports".

Low-power Consumption Mode

To transit to the sleep mode, watch mode, stop mode, watch mode(power-off) or stop mode(power-off), follow the procedure explained in the "Activating the sleep mode, watch mode, or stop mode" or the "Activating the watch mode (power-off) or stop mode(power-off)" of "POWER CONSUMPTION CONTROL" in Hardware Manual.

Take the following notes when using a monitor debugger.

- Do not set a break point for the low-power consumption transition program.
- Do not execute an operation step for the low-power consumption transition program.

Precautions When Writing to Registers Including the Status Flag

When writing a function control data in the register that has a status flag (especially, an interrupt request flag), taking care not to clear its status flag erroneously must be followed.

The program must be written not to clear the flag to the status bit, and then to set the control bits to have the desired value.

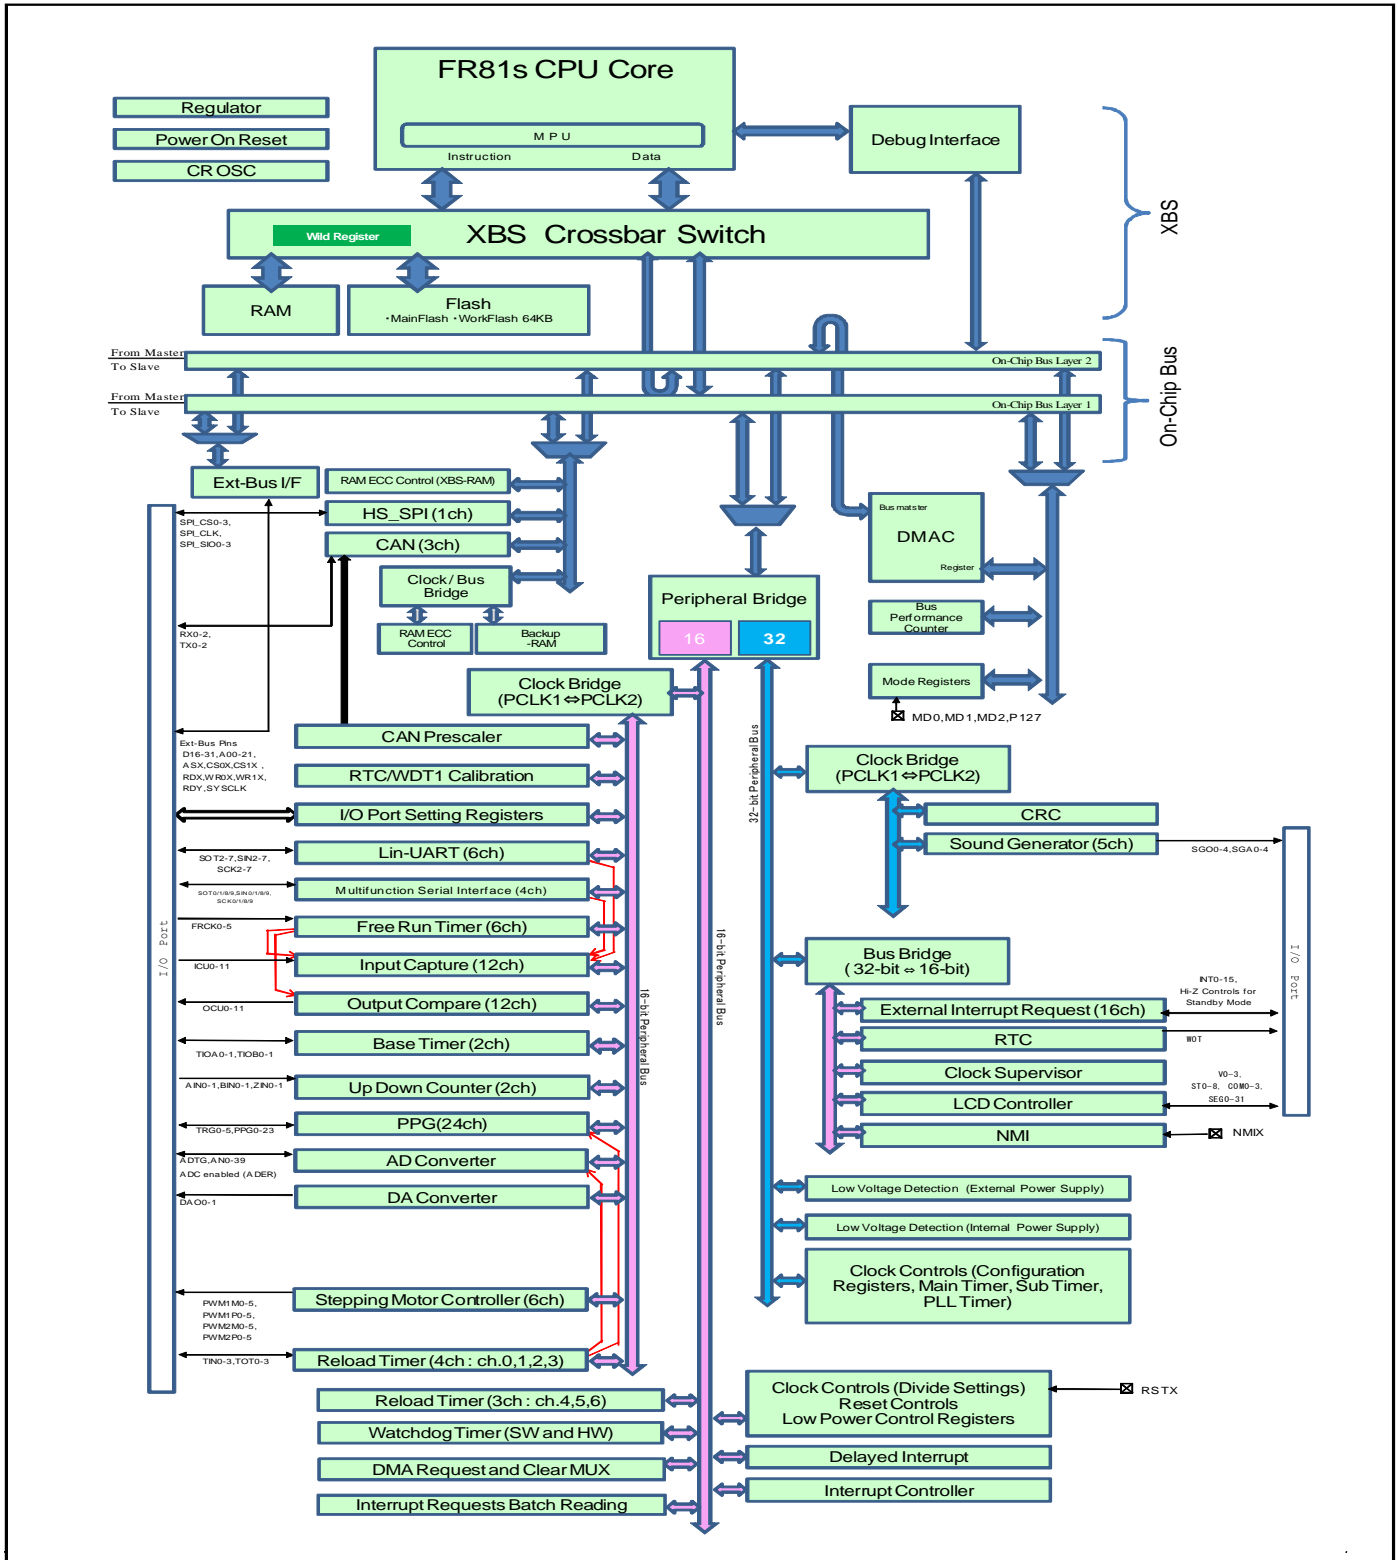

Especially, if multiple control bits are used, the bit instruction cannot be used. (The bit instruction can access to a single bit only.) By the Byte, Half-word, or Word access, writing data in the control bits and status flag simultaneously is done. During this time, take care not to clear other bits (in this case, the bits of status flag) erroneously.

Note: These points can be ignored because the bit instructions to a register which supports RMW are already taken the points into consideration. Care must be taken when the bit instruction is used to a register which does not support RMW.

No-connected-pin

The product of LQFP-208 has some no-connected-pin which is not connected to any function on die. Pins are recommended to be pulled-up or pulled-down on the extern circuit.

The access by the data access attribute not described is disabled.

Initial register value after reset

The initial register value after reset indicates as follows:

- "1": Initial value "1"
- "0": Initial value "0"
- "X": Initial value undefined
- "-": Reserved bit/Undefined bit
- **": Initial value "0" or "1" according to the setting

Note:

It is prohibited to access addresses not described here.

- *1: It does not support the DMA transfer request by the interrupt generated from a peripheral to which no RN (Resource Number) is assigned.
- *2: Reload timer ch.4 to ch.6 does not support the DMA transfer by the interrupt.
- *3: The status of the multi-function serial interface does not support the DMA transfer by I²C reception.
- *4: HS_SPI does not support the DMA transfer by the interrupt.
- *5: The clock calibration unit does not support the DMA transfer by the interrupt.
- *6: It does not support the DMA transfer by the interrupt because of the RAM ECC bit error.
- *7: REALOS is the trademark of Cypress.

Power consumption	P _D	—	710	mW	
Operating temperature	T _A	-40	+105	°C	
Storage temperature	T _{stg}	-55	+150	°C	

*1: This parameter is based on V_{SS} = AV_{SS} = DV_{SS} = 0.0 V.

*2: Caution must be taken that AV_{CC}, DV_{CC}, and V_{CC}E do not exceed V_{CC5} upon power-on and under other circumstances.

*3: Maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

*4: Average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 10 ms period. The average value is the operation current × the operation ratio.

*5: The total output current is defined as the maximum current value flowing through all of corresponding pins.

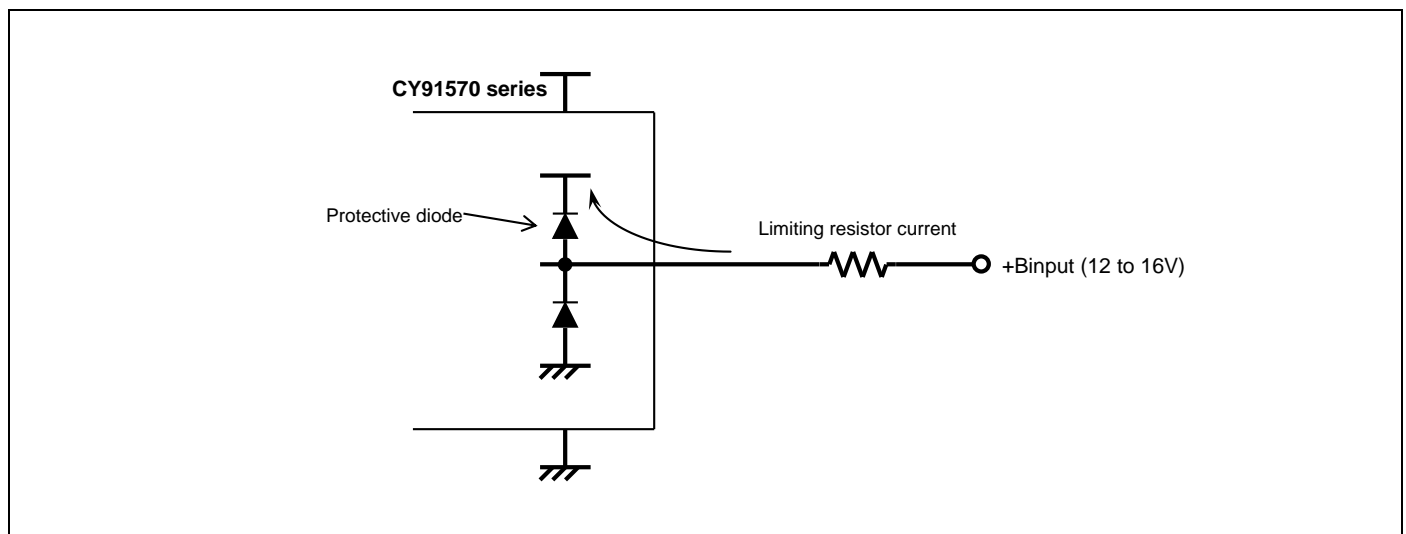

*6: Outputs other than P60-P87 pins

*7: Output of P60-P87 pins

*8:

- Corresponding pins: all general-purpose ports. (Except P010 to P017, P020 to P027, P030 to P037, P040 to P047, P050 to P053, P90/ADTG/PPGO_2)
- Use within recommended operating conditions.
- Use at DC voltage (current).
- The + B signal should always be applied by connecting a limiting resistor between the + B signal and the microcontroller.
- The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed rated values at any time regardless of instantaneously or constantly when the + B signal is input.
- Note that when the microcontroller drive current is low, such as in the low power consumption modes, the + B input potential can increase the potential at the V_{CC} pin via a protective diode, possibly affecting other devices.
- Note that if the + B signal is input when the microcontroller is off (not fixed at 0 V), since the power is supplied through the pin, the microcontroller may operate incompletely.
- Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.
- Do not leave + B input pins open.

Sample Recommended Circuit

WARNING:

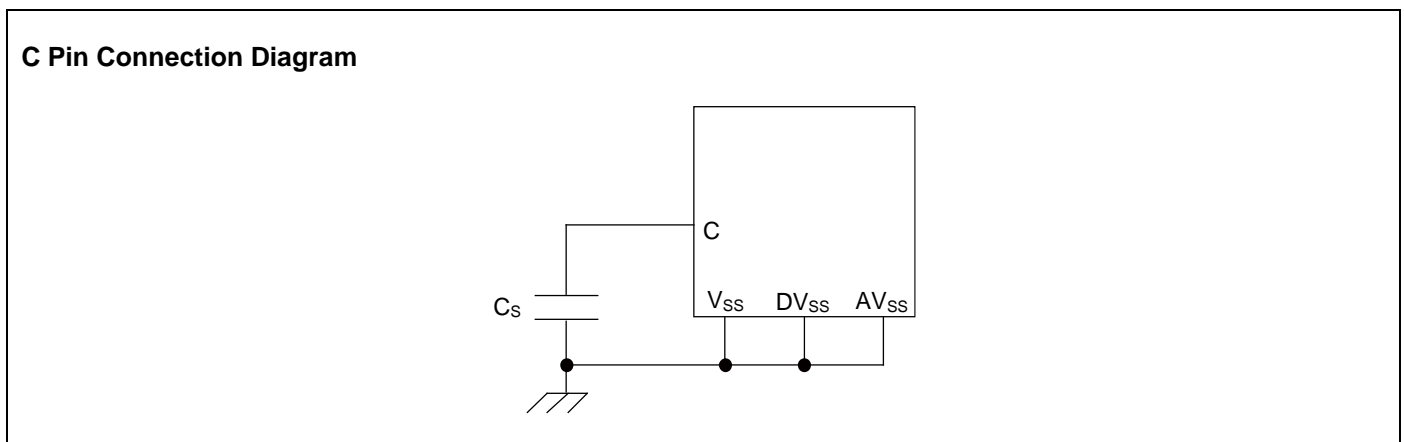

Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

*: Refer to the following diagram for details on the connection of smoothing capacitor C_S.

WARNING:

The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions. Any use of semiconductor devices will be under their recommended operating condition. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

13.4 AC Characteristics

13.4.1 Main Clock Timing

(T_A: Recommended operating conditions, V_{CC5} = 5.0V±10%, V_{SS} = DV_{SS} = AV_{SS} = 0.0V)

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Source oscillation clock frequency	F _C	X0, X1	–	–	4	–	MHz	
Source oscillation clock cycle time	t _{CYL}	X0, X1	–	–	250	–	ns

	F _{CPT}	–	–	2	–	40	MHz	External bus clock
Internal operating clock cycle time*	t _{CP}	–	–	12.5	–	500	ns	CPU clock
	t _{CPP}	–	–	25	–	500	ns	Peripheral bus clock
	t _{CPT}	–	–	25	–	500	ns	External bus clock
CAN PLL jitter (when lock)	t _{PJ}	–	–	-10	–	+10	ns	F _{CP} = 80 MHz (4 MHzxMultiplied by 20)
Built-in CR oscillation frequency	F _{CCR}	–	–	50	100	200	kHz	

*: The maximum / minimum value is defined when using the main clock and PLL clock.

13.4.2 Sub Clock Timing (Products without S-suffix)

 (T_A: Recommended operating conditions, V_{CC} = 5.0V±10%, V_{SS} = DV_{SS} = AV_{SS} = 0.0V)

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Source oscillation clock frequency	F _{CL}	X0A, X1A	–	–	32.768	–	kHz	
Source oscillation clock cycle time	t _{LCYL}	X0A, X1A	–	–	30.52	–	µs	

X0A, X1A Clock Timing

Guaranteed Operation Range

Note: The CPU will be reset at the power supply voltage $4V \pm 0.3V$ or less.

Oscillation Clock Frequency vs. Internal Operation Clock Frequency

		Internal Operation Clock Frequency							
		Main Clock	PLL Clock						
			Multiplied by 1	Multiplied by 2	Multiplied by 3	Multiplied by 4	...	Multiplied by 19	Multiplied by 20
Oscillation clock frequency	4 MHz	2 MHz	4 MHz	8 MHz	12 MHz	16 MHz	...	76 MHz	80 MHz

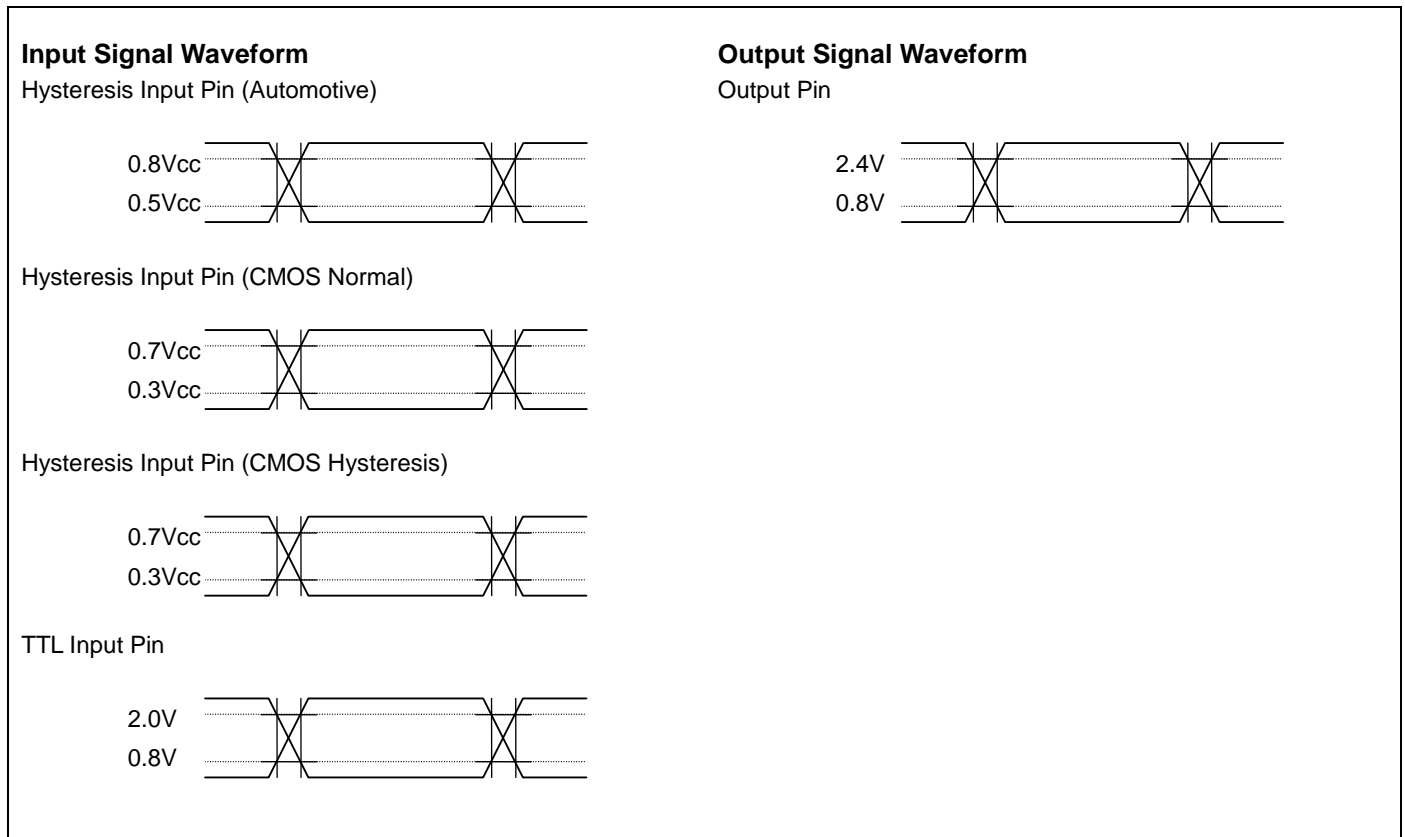

■ Example of oscillation circuit

Note: As to the product with its clock supervisor's initial value is "ON", when the oscillator is unable to start within 20ms from the stop state the clock supervisor will detect the oscillation stop. As a result, the CPU moves to the fail safe operation.

Design your printed circuit board so that the oscillator can start oscillation within 20ms.

AC characteristics are specified by the following measurement reference voltage values.

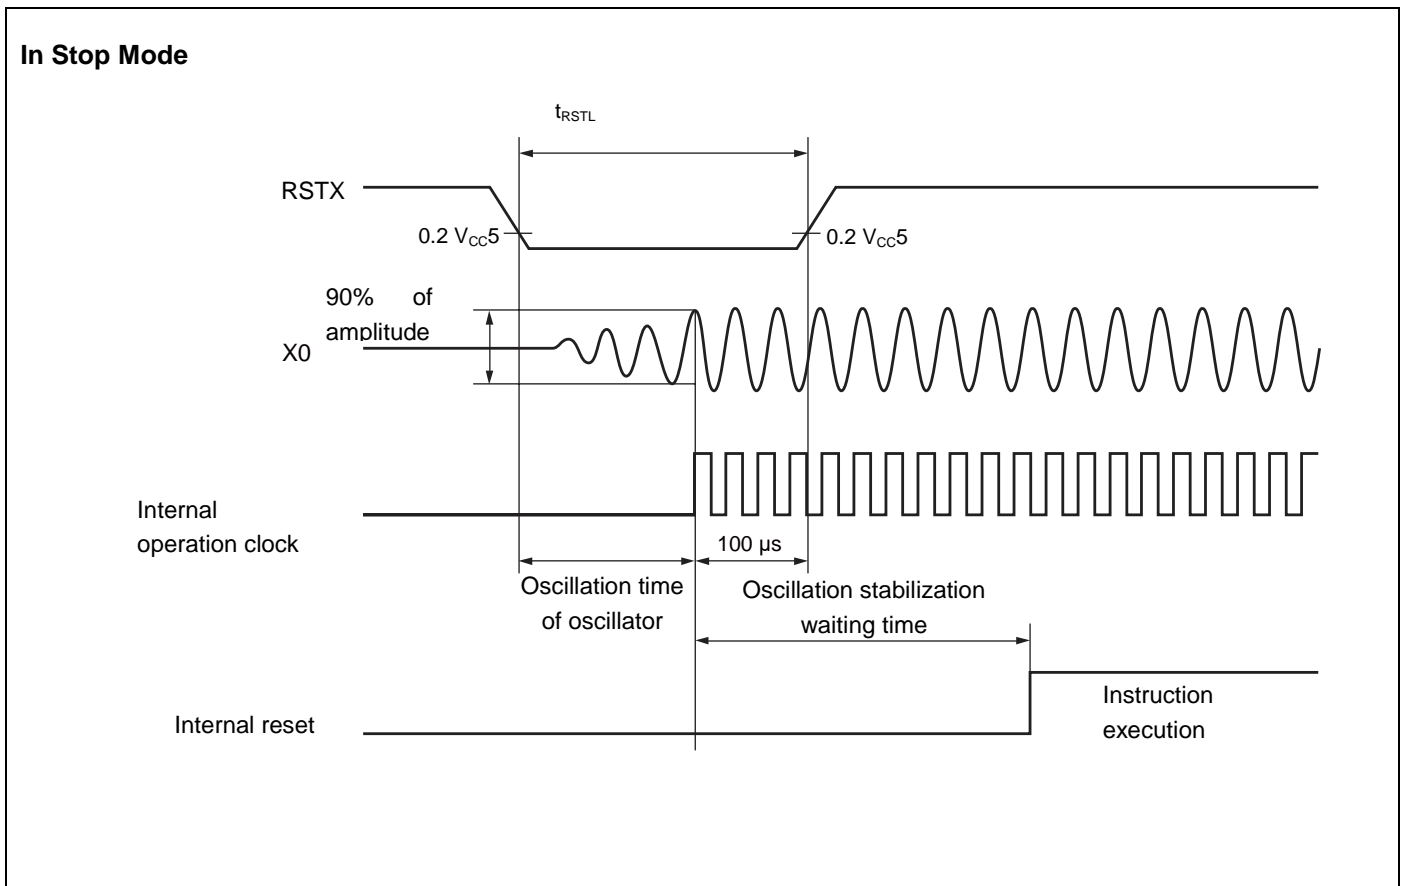

13.4.3 Reset Input

(T_A: Recommended operating conditions, V_{CC5} = 5.0V±10%, V_{SS} = AV_{SS} = 0.0V)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
Reset input time	t _{RSTL}	RSTX	—	10	—	μs	Under normal operation
				Oscillation time of oscillator* +100 μs	—	ms	In Stop mode
				100 μs	—	μs	In RTC mode
Width for reset input removal				1 μs	—	μs	

*: The oscillation time of the oscillator is the time it takes for the amplitude of the oscillations to reach 90%.

For crystal oscillators, this time is between several ms and several tens of ms, for ceramic oscillators the time is between several hundred μs and several ms, and for an external clock, the time is 0 ms.

13.4.4 Power-on Conditions

 (T_A: Recommended operating conditions, V_{SS} = 0.0V)

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Level detection voltage	–	V _{CC5}	–	2.1	2.3	2.5	V	When turning on power for microcontroller
Level detection hysteresis width	–	V _{CC5}	–	–	–	125	mV	During voltage drop
Level detection time	–	–	–	–	–	30	us	*1
Slope detection undetected standard	–	V _{CC5}	V _{CC5} = at level detection release level time	–	–	4	mV/μs	*2
Power off time	t _{OFF}	V _{CC5}	–	50	–	–	ms	*3

*1: If the fluctuation of the power supply is faster than the low voltage detection time, there is the possibility to generate or release after the power supply voltage has exceeded the detection voltage range.

*2: When setting the power supply fluctuation to this standard or less, it is possible to suppress the slope detection. This is the standard when the power supply fluctuation is stable.

*3: This time is to start the slope detection at next power on after power down and internal charge loss

*1: R and C_L represent the pull-up resistance and load capacitance of the SCL and SDA output lines, respectively.

V_P shows the power-supply voltage of the pull-up resistor and I_{OL} shows the V_{OL} guarantee current.

*2: The maximum t_{HDDAT} only has to be met if the device does not extend the "L" width (t_{LOW}) of the SCL signal.

*3: A high-speed mode I²C bus device can be used on a standard mode I²C bus system as long as the device satisfies the requirement of "t_{SUDAT} ≥ 250 ns".

*4: t_{CPP} is the peripheral clock cycle time. Adjust the peripheral bus clock to 8MHz or more when use I²C.

13.5.2 Definition of A/D Converter Terms

- Resolution : Analog variation that is recognized by an A/D converter.
- Linearity error : Deviation of the actual conversion characteristics from a straight line that connects the zero transition point ("00 0000 0000" ←→ "00 0000 0001") to the full-scale transition point ("11 1111 1110" ←→ "11 1111 1111").
- Differential linearity error : Deviation of the input voltage from the ideal value that is required to change the output code by 1LSB.
- Total error : Difference between the actual value and the theoretical value. The total error includes zero transition error, full-scale transition error, and linearity error.

$$\text{Total error of digital output } N = \frac{V_{NT} - \{1\text{LSB} \times (N - 1) + 0.5\text{LSB}\}}{1\text{LSB}} \quad [\text{LSB}]$$

$$1\text{LSB (Ideal value)} = \frac{\text{AVRH} - \text{AVSS}}{1024} \quad [\text{V}]$$

$$V_{OT} \text{ (Ideal value)} = \text{AVSS} + 0.5 \text{LSB} [\text{V}]$$

$$V_{FST} \text{ (Ideal value)} = \text{AVRH} - 1.5 \text{LSB} [\text{V}]$$

V_{NT} : Voltage at which the digital output changes from (N - 1) to N.

$$\text{Linearity error of digital output } N = \frac{V_{NT} - \{1\text{LSB} \times (N - 1) + V_{OT}\}}{1\text{LSB}} \text{ [LSB]}$$

$$\text{Differential linearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1\text{LSB}} - 1 \text{LSB [LSB]}$$

$$1\text{LSB} = \frac{V_{FST} - V_{OT}}{1022} \text{ [V]}$$

V_{OT} : Voltage at which the digital output changes from “000_H” to “001_H”.
 V_{FST} : Voltage at which the digital output changes from “3FE_H” to “3FF_H”.

13.5.3 Notes on Using A/D Converter

<About the output impedance of the analog input of external circuit>

- External impedance values of the external input of 4.2 kΩ or lower (sampling time = 1.2 μs@ machine clock of 16 MHz) are recommended. When the external impedance is too high, the sampling time for analog voltages may not be sufficient. In this case, it is recommended to connect the capacitor (approx. 0.1 μF) to the analog input pin.

Analog Input Circuit Model

Note: Listed values must be considered as reference values.

*1: The guaranteed value for erasure up to 100,000 cycles.

*2: Number of erase cycles for each sector.

*3: This value comes from the technology qualification (using Arrhenius equation to translate high temperature measurements into normalized value at + 85°C).

13.7.2 Notes

While the Flash memory is written or erased, shutdown of the external power (V_{CC5}) is prohibited.

In the application system where V_{CC5} might be shut down while writing or erased, be sure to turn the power off by using an external low-voltage detection function.

To put it concretely, after the external power supply voltage falls below the detection voltage (V_{DL}*¹), hold V_{CC5} at 2.7 V or more within the duration calculated by the following expression:

$$T_d^{*1}[\mu s] + (\text{period of PCLK} [\mu s] \times 257) + 50 [\mu s]$$

*1: See “13.4. AC characteristics, 13.4.10. Low voltage detection (External low-voltage detection)”.

NOTES

- ALL DIMENSIONS ARE IN MILLIMETERS
- DATUM PLANE H IS LOCATED AT THE BOTTOM OF THE MOLD PARTING LINE COINCIDENT WITH WHERE THE LEAD EXITS THE BODY.
- DATUMS A-B AND D TO BE DETERMINED AT DATUM PLANE H.
- TO BE DETERMINED AT SEATING PLANE C.
- DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PRE SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.
- DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
- REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS. DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS. BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
- DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. THE DAMBAR PROTRUSION (S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
- THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
- A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.
