STSW-BLUETILE-DK ACTIVE

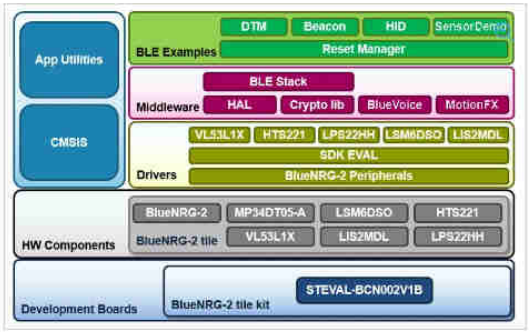
Print Save to MyST Share via Email

Software development kit for the BlueTile, including sensor data streaming over BLE, HID peripheral, Beacon, etc.

Get Software | Download databrief

Overview | Tools & Software | Resources

The STSW-BLUETILE-DK is based on STSW-BLUENRG1-DK evaluation SW package.



The STSW-BLUENRG1-DK package supports the BlueNRG-1 and BlueNRG-2 Bluetooth Low-Energy system-on-chip. This package includes a Wizard PC application to automatically generate the configuration header file needed for the BLE radio initialization. This package also includes BlueNRG-1 and BlueNRG-2 peripheral drivers and related examples, the BLE firmware stack together with the HAL (Hardware Abstraction Layer) and CryptoLib (Cryptographic Library).

The STSW-BLUETILE-DK supports the BlueTile platform. This package extends STSW-BLUENRG1-DK

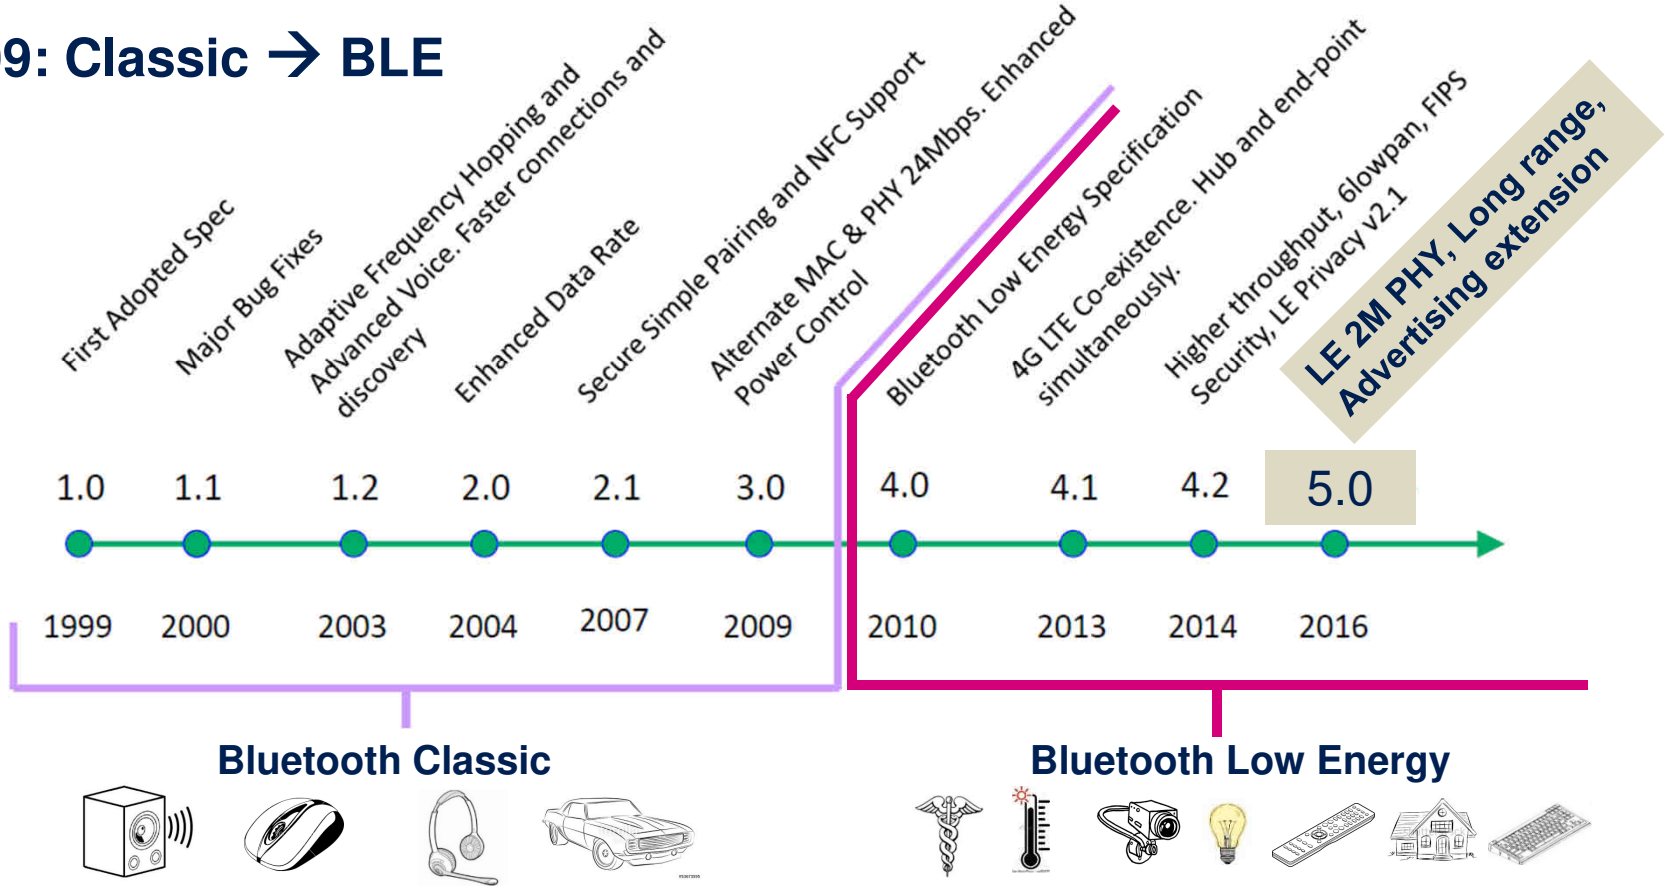
Introduction to
Bluetooth Low Energy

life.augmented

Bluetooth® Evolution

- **20 Years in the market!**
- **2009: Classic → BLE**



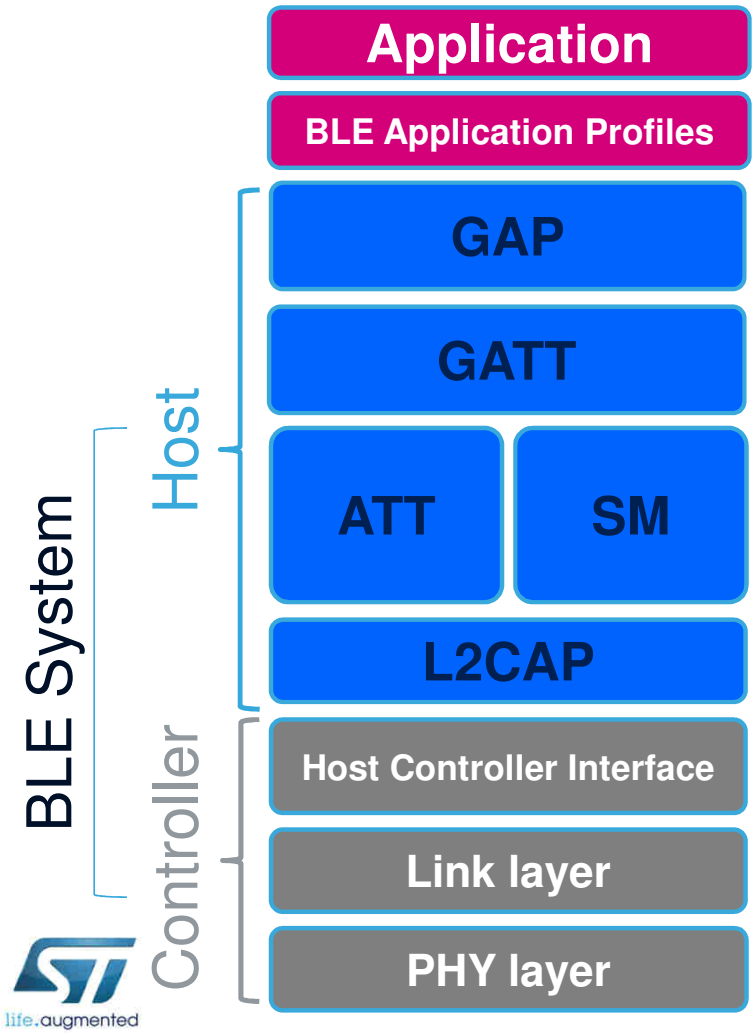
life.augmented

Bluetooth Low Energy (LE)

Designed for Success

- Lower power than Bluetooth “Classic” (or Bluetooth 3.0)
  - Lower duty cycle
  - Faster connection
  - Lower peak power (relaxed RF parameters)
- Compatible with all major platforms (iOS, Android, Windows, Linux)
- Multiple network topologies:
  - Point to point: single master connects to single slave (and each slave can connect to 2 master)
  - Star: Multiple slaves connected to a single master
  - Mesh: introduced in the 2017
- State of the Art encryption, security including privacy/authentication

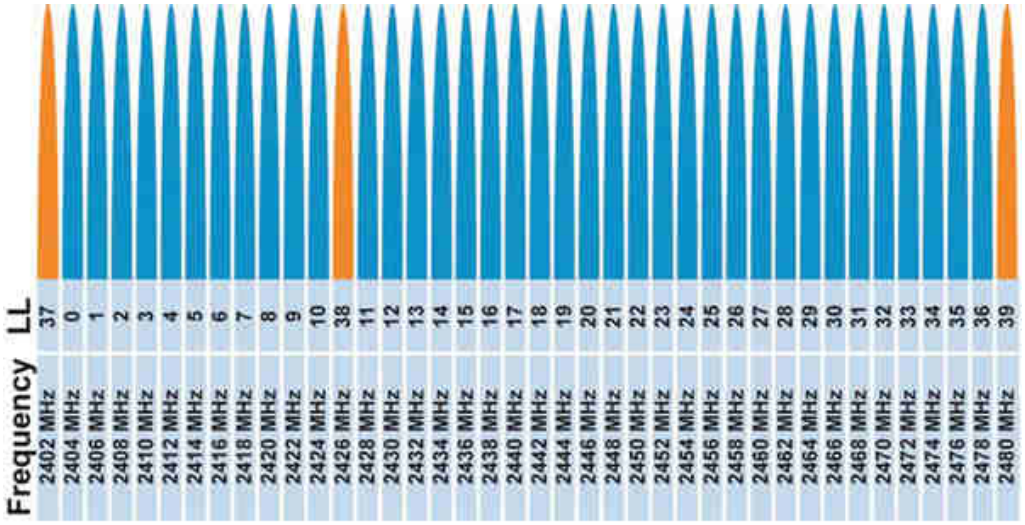
Protocol Stack



- **Generic Acces Profile**
  - How a device can discover and connect with one another
- **Generic Attribute Profile**
  - How services, characteristics can be discovered and then used
- **Attribute Protocol**
  - Protocol for discovering, reading, and writing attributes on a peer
- **Security Manager**
  - Handles the secure communication
- **L2CAP**
  - Protocol multiplexer. Segmentation and reassembly of packets
- **HCI**
  - Interface between Host and Controller
- **Link Layer**
  - Handles packets, channels, advertising, scanning & connections
- **Physical Layer**
  - Transmits/receives bits

Protocol Stack: PHY

- A **BLE Radio** is a **2.4 GHz ISM Band Transceiver**
- **40 RF Channels**, **2 MHz Channel Spacing**. Two types of channels:
  - **Advertising channels** (**3 - orange**) for Advertising Packets. Used for Discoverability and for Broadcasting/Observing
  - **Data Channels** (**37 - blue**) for Data Packets. Used to send application data in Connection

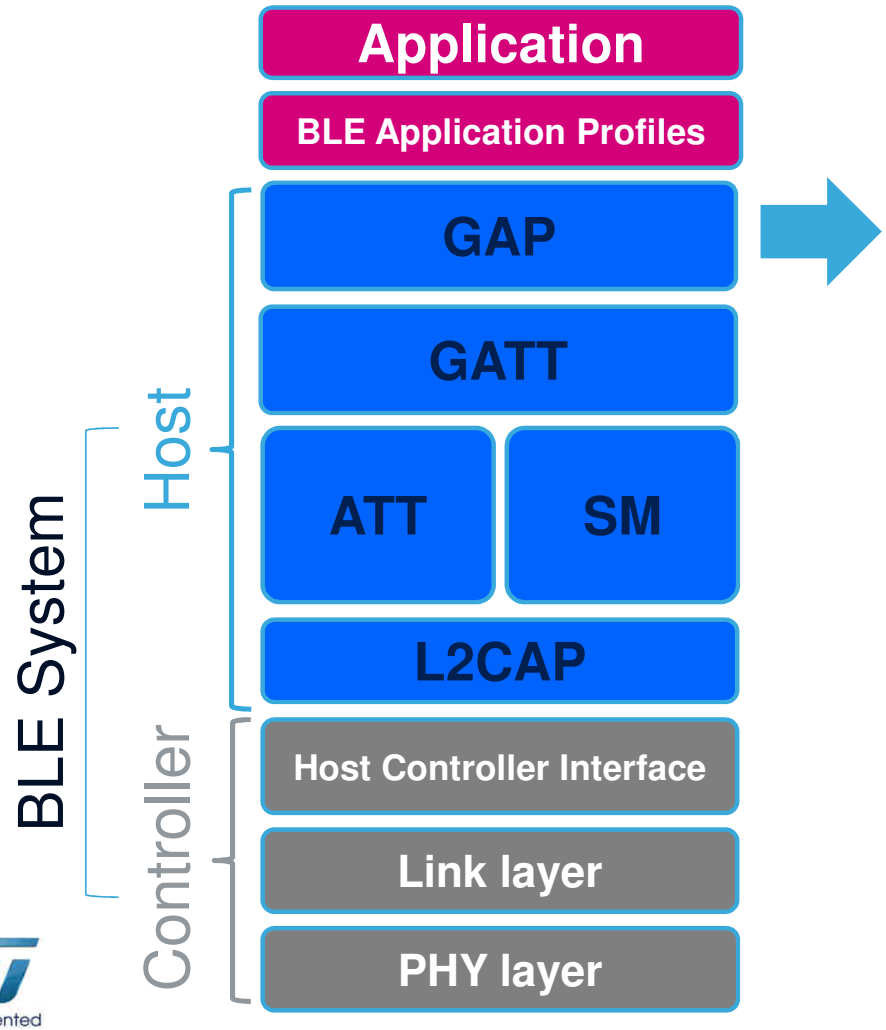


Source : Bluetooth® SIG

- **GFSK Modulation**
  - BT = 0.5
  - Modulation Index = 0.5
  - “pulse shaping” Gaussian filter “smooths” transitions from zero to one reduces spectral width

life.augmented

Protocol Stack - GAP



- Who controls the radio network?
  - **GAP (Generic Access Profile)**
  - Defines 4 roles
    - **Broadcaster**
    - **Observer**
    - **Peripheral**
    - **Central**

life.augmented

Peripheral

Connection

I'm looking for John

Central

Peripheral is in Advertising mode.
Sends Advertising packets.

Central is **Scanning**.
Look for known peripherals by listening to advertising packets.

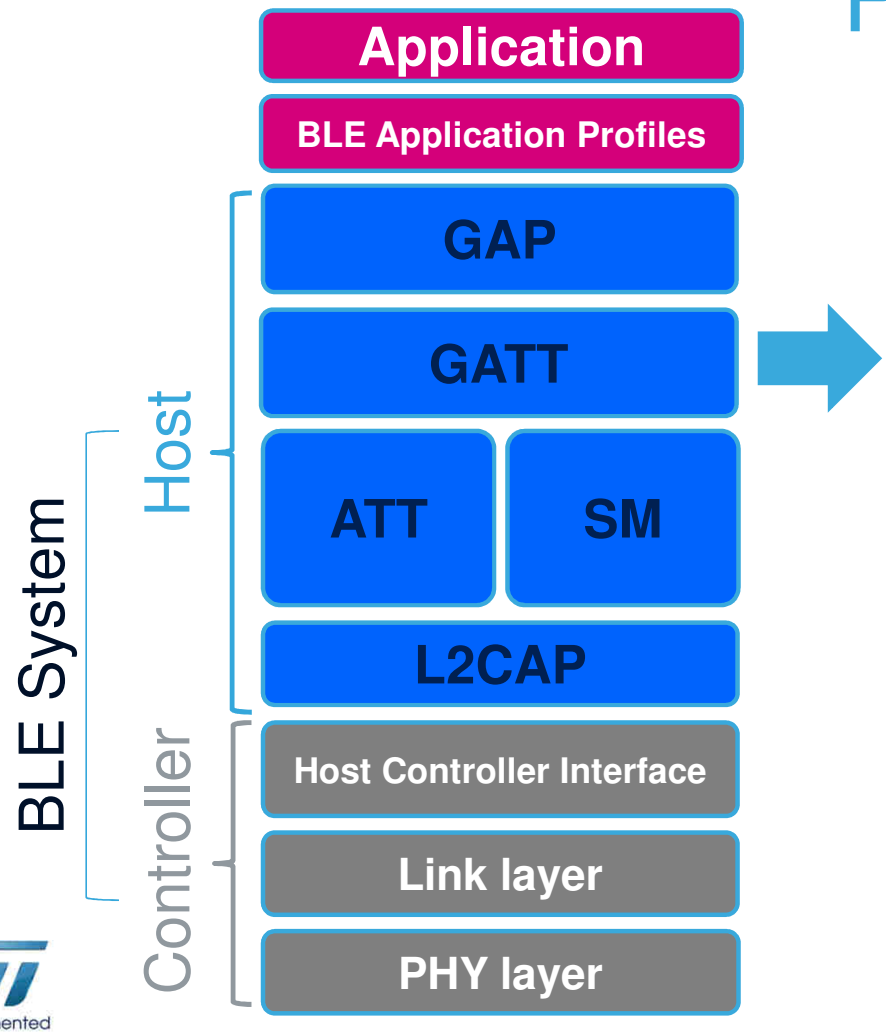
My name is John
My capabilities are X, Y, Z, etc…

Advertising **packets consists of multiple information units known as AD types**.
E.g.: Local Name, TX Output Power, Manufacturer Specific info, etc…

As the John peripheral is found, it initiates a BLE connection.

life.augmented

Protocol Stack - GATT

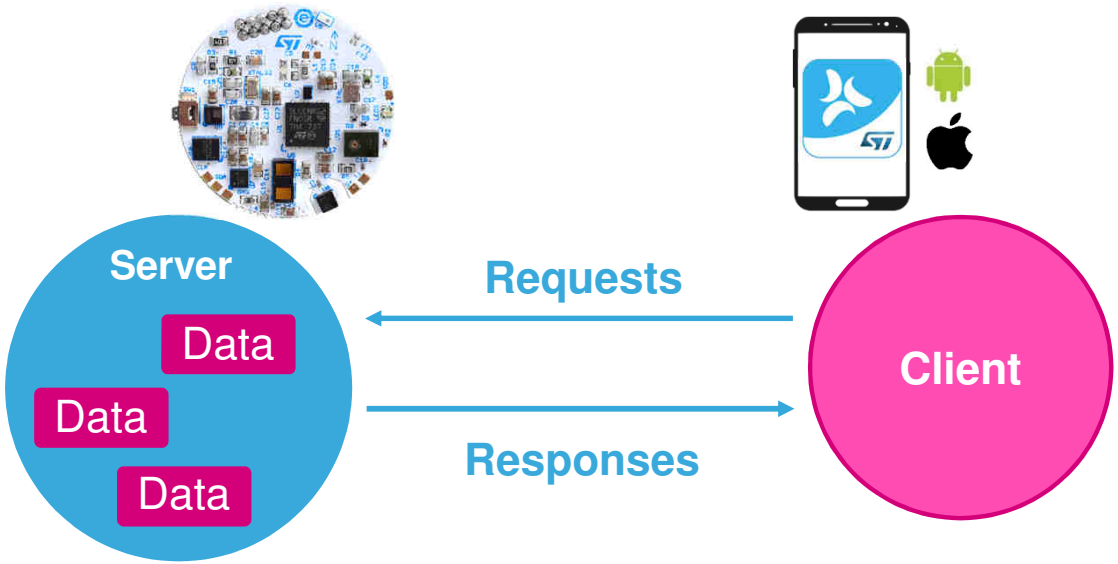


- Who controls the data flow?
  - **GATT (Generic Attribute Profile)**
  - Defines 2 roles
    - **Server**
    - **Client**

life.augmented

GATT

Server contains the data.
Receives requests, executes, responds.
Can indicate value



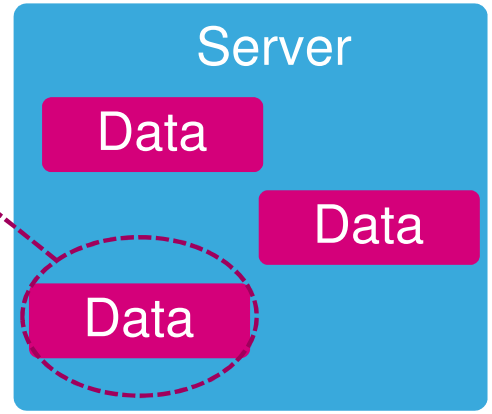
Client talks to the server.
Sends requests, wait for response.
Can confirm indications

Protocol PDU Type	Sent by	Description
Request	Client	Client requests something from server (it always causes a response)
Response	Server	Server sends response to a request from a client
Command	Client	Client commands something to server (no response)
Notification	Server	Server notifies client of new value (no confirmation)
Indication	Server	Server indicates to client new value (it always causes a confirmation)
Confirmation	Client	Confirmation to an indication

Attributes

- **Data are organized** and exposed as **attributes**

Each **Data** element in the Server is called **Attribute**



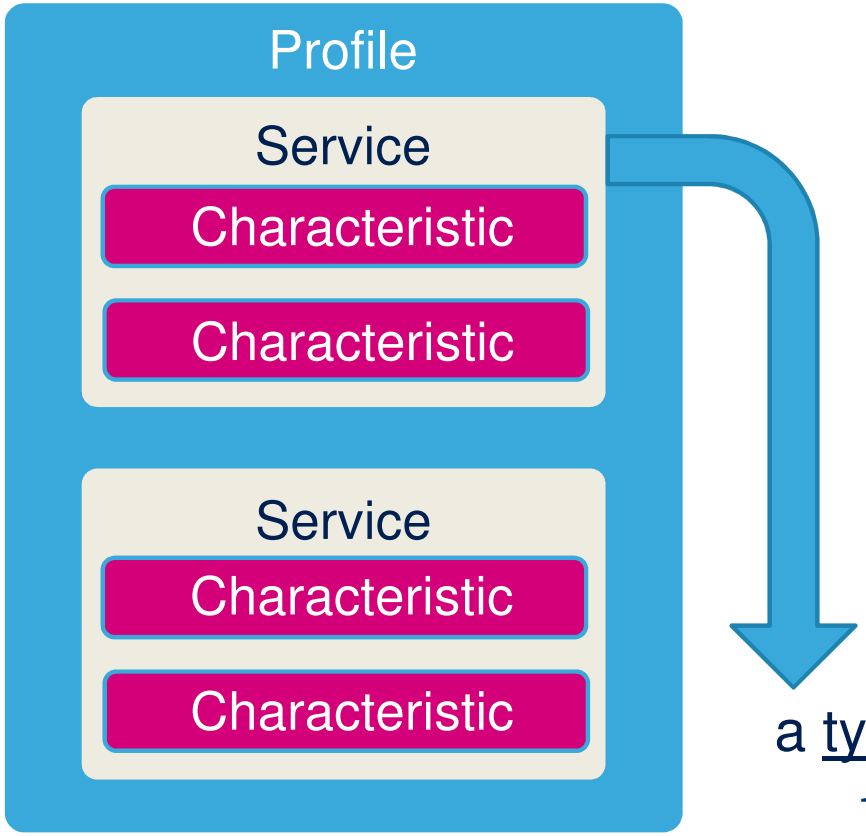
- Each attribute has:
  - A **handle**: it identifies the attribute on the server
  - A **type** (defined by Universal Unique ID - **UUID**): what the value means
    - 16-bit UUID: pre-defined by Bluetooth SIG
    - 128-bit UUID: Vendor Specific identifiers
  - A **value** (0 to 512 octets)
- Example

Handle	Type	Value
0x0009	«Device Name»	"Temperature Sensor"
0x0022	«Battery State»	0x04
0x0098	«Temperature»	0x0802

Source : Bluetooth® SIG

life.augmented

GATT Profile



- A GATT Profile defines how attributes are organized and how the application can access them.
- Attributes are organized in Services and Characteristics

a typical example:

1 service: “ARG” (Angular Rate and Gravity)

2 characteristics: “Gyro”, “Acc”

Values: [0,-1,+2], [-10,+15,+950]

Labs Overview

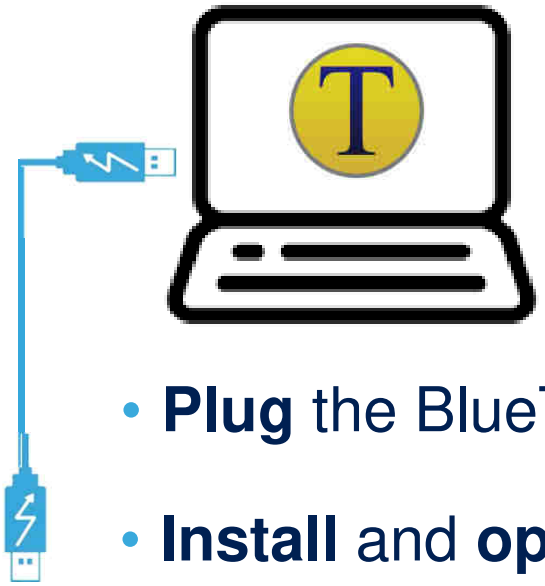
- **Lab 1**: Getting started with STEVAL-BCN002V1 “Serial Terminal Test”
- **Lab 2**: Connecting to the ST BLE Sensor app
- **Lab 3**: LED characteristic
- **Lab 4**: Accelerometer embedded events detection
- **Lab 5**: 9-axis Acc+Gyro+Mag Sensor Data Fusion
- **Lab 6**: Cloud data logging on IBM Watson
- **Lab 7**: Voice over BLE

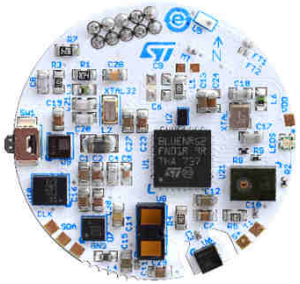
Lab 1

Getting Started with STEVAL-BCN002V1B
“Serial Terminal Test”

life.augmented

“Serial Terminal Test”





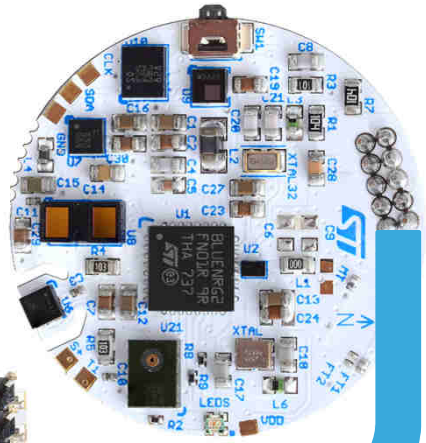
- **Plug** the BlueTile to the PC using the USB cable
- **Install** and **open** **Tera Term** and **configure** serial terminal

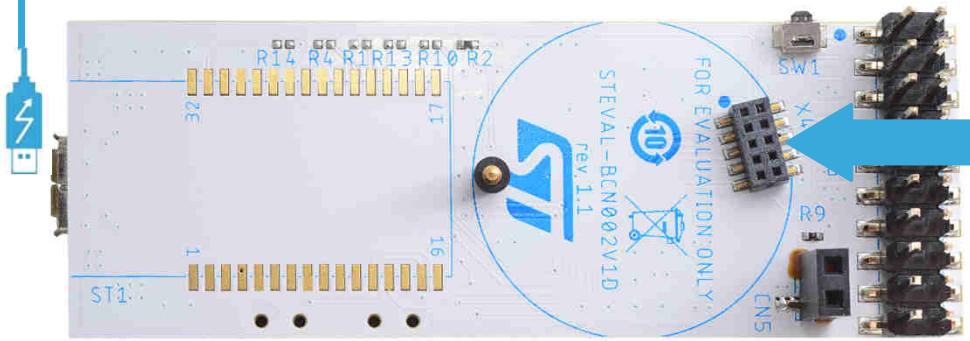
life.augmented

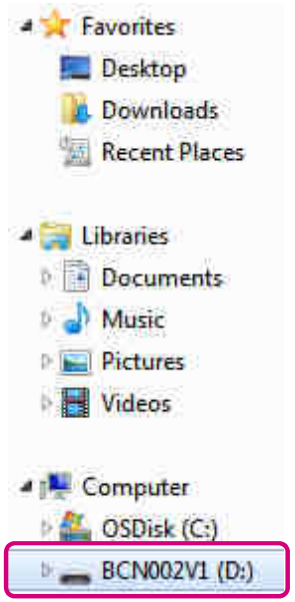
Connect Your STEVAL-BCN002V1B
to the PC Using USB

Connect the USB cable

The BlueTile comes already connected to the daughterboard





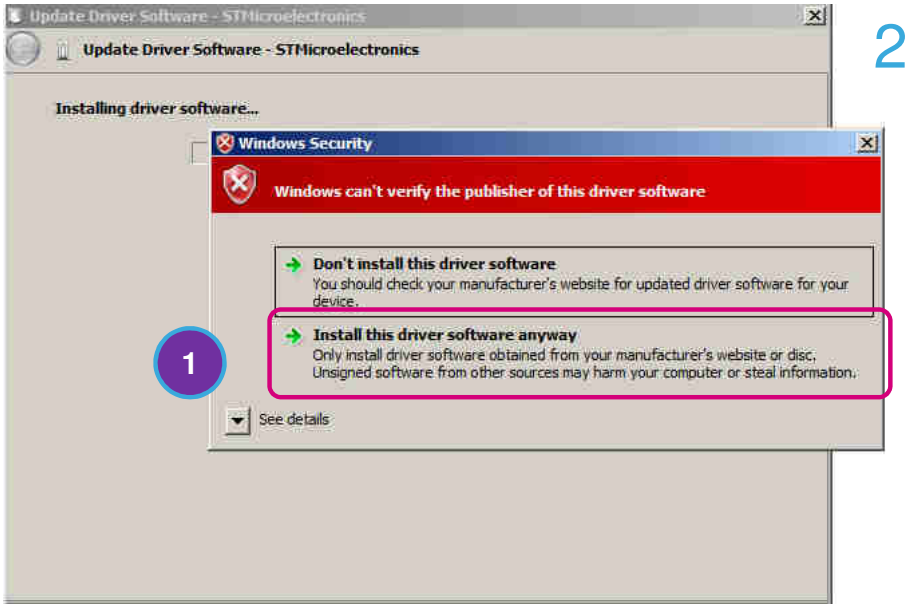


On the PC file system a BCN002V1 drive will appear

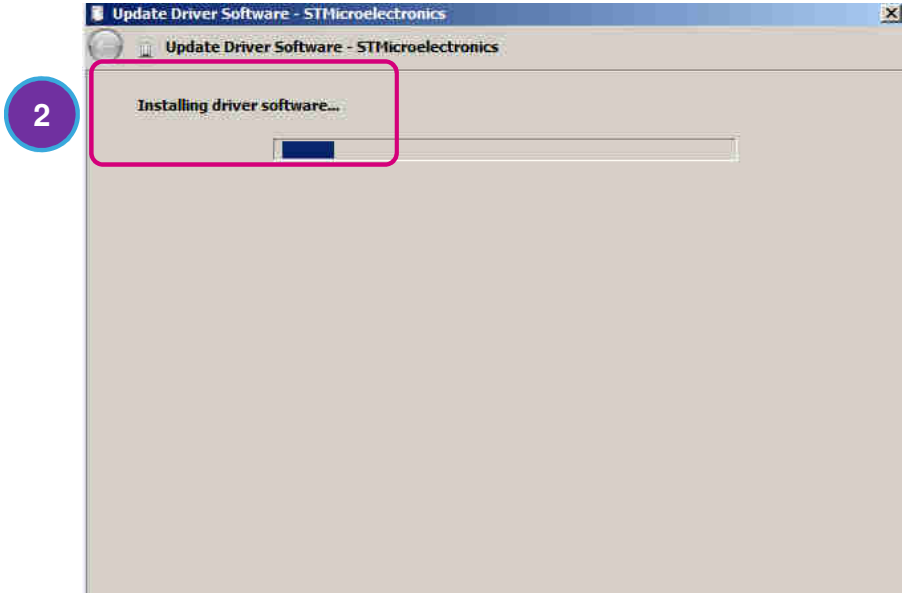
life.augmented

Windows7: Allow the Driver Installation

1. Click on **Install driver software anyway**



2. Installation starts



life.augmented

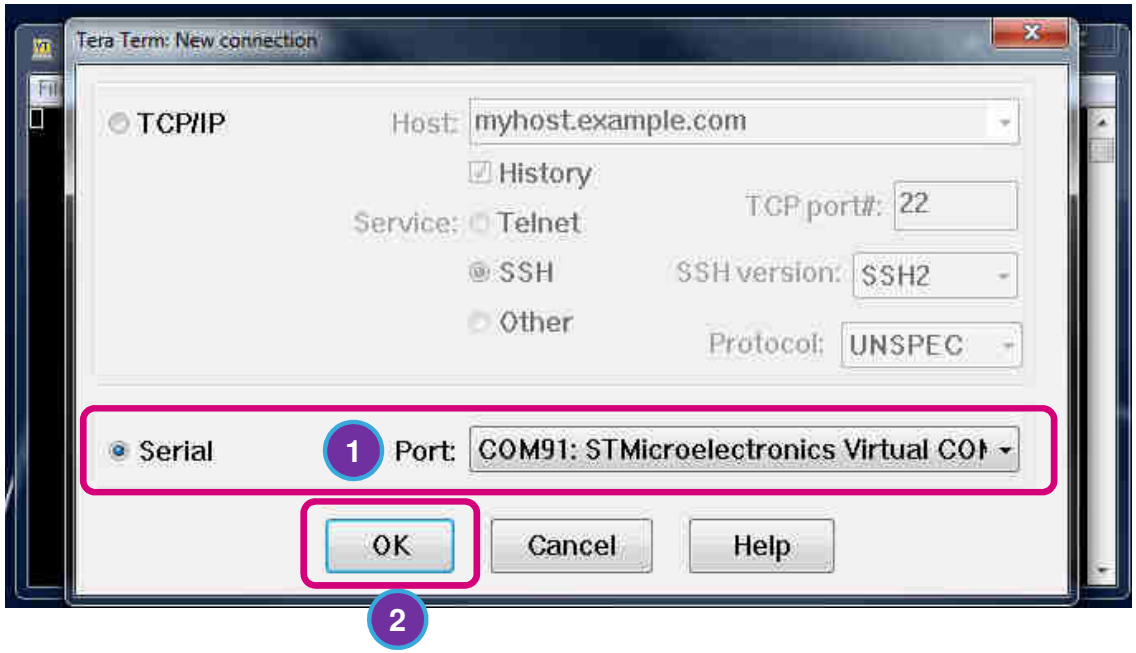
Virtual COM Port Driver

If you have issue with the **STMicroelectronics Virtual COM Port** device driver installation here the **instructions** for installing the Virtual COM port driver:

Win7 **Win10**

life.augmented

Tera Term Configuration 1/4



1. **Select** the **STMicroelectronics Virtual COM Port**
   - **NOTE:** on **Win10 PC** the serial port is labeled just as **"COMxx"**
2. Click **OK**

life.augmented

Tera Term Configuration 2/4

1. In **Setup** -> **Serial port…**
   Set the following:

   Baud rate : 115200

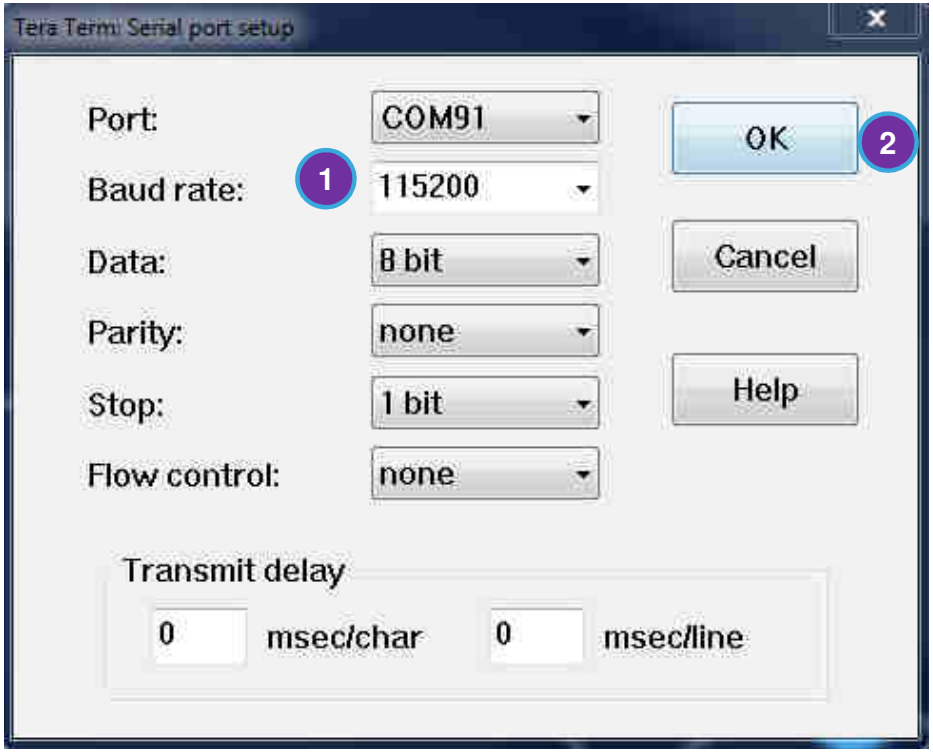
   Data : 8 bit

   Parity : none

   Stop : 1 bit

   Flow control : none

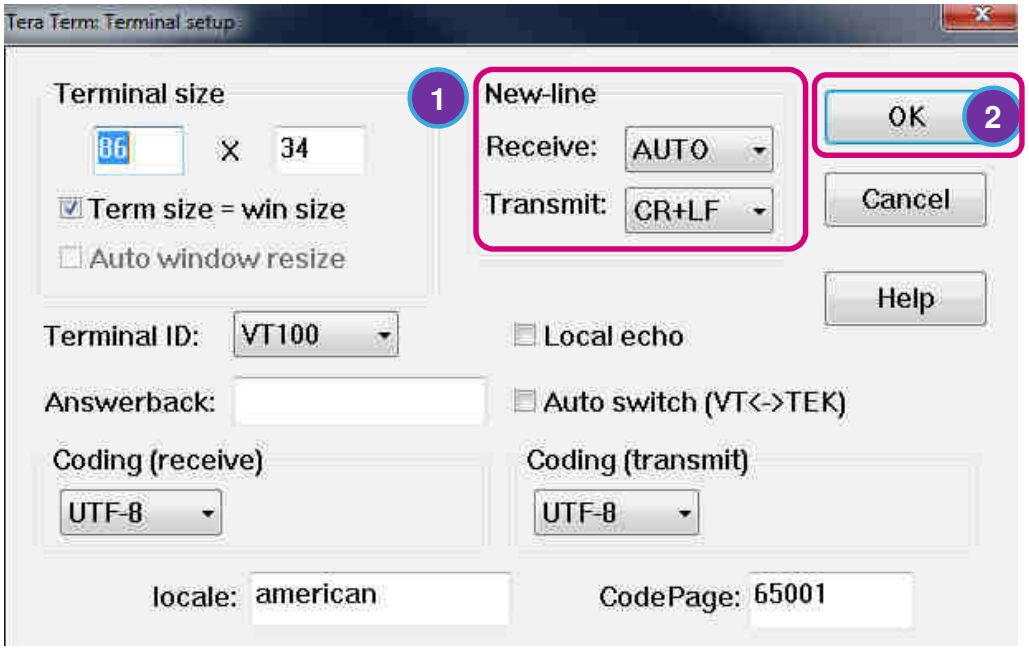
2. **Click OK**



life.augmented

Tera Term Configuration 3/4

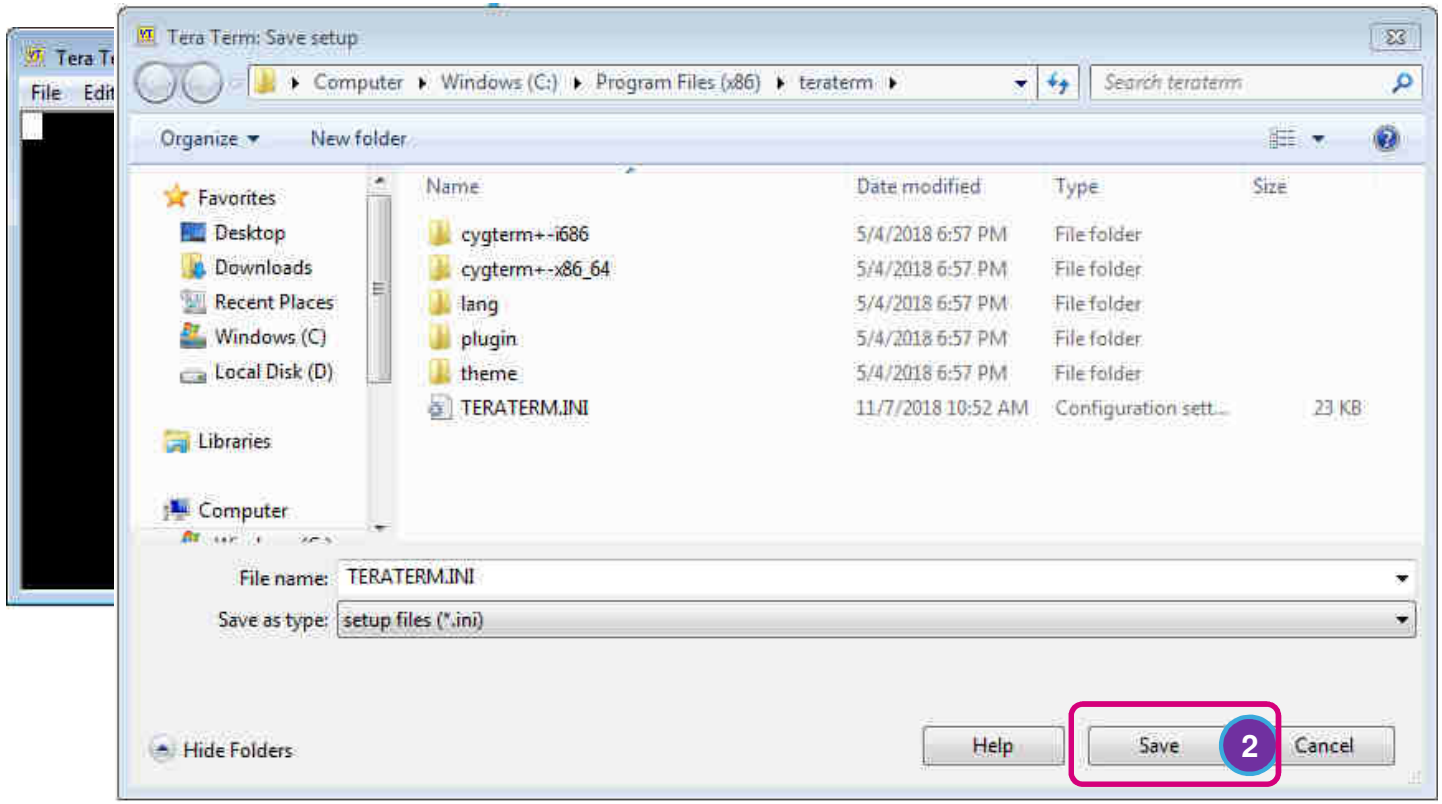
1. In **Setup** -> **Terminal…** set **New-line Receive: AUTO**
2. **Click OK**



life.augmented

Tera Term Configuration 4/4

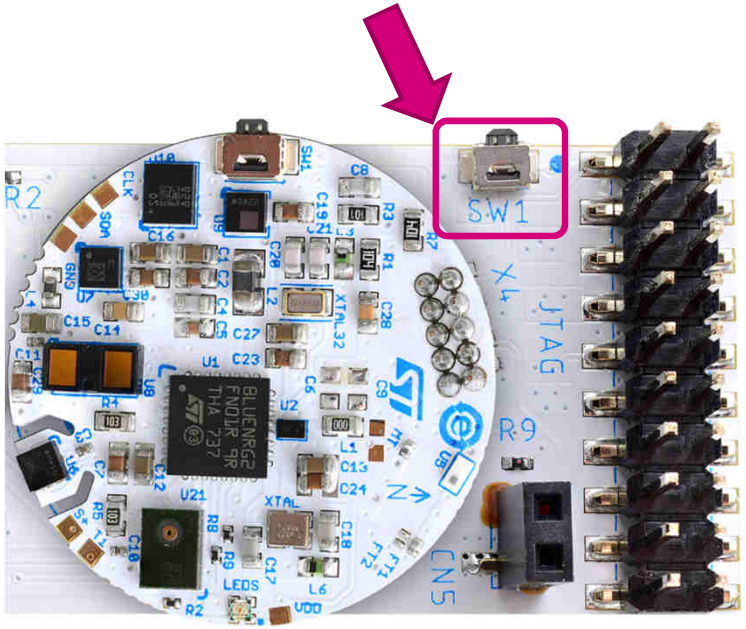
1. Click **Setup->Save setup…**
2. Click **Save**

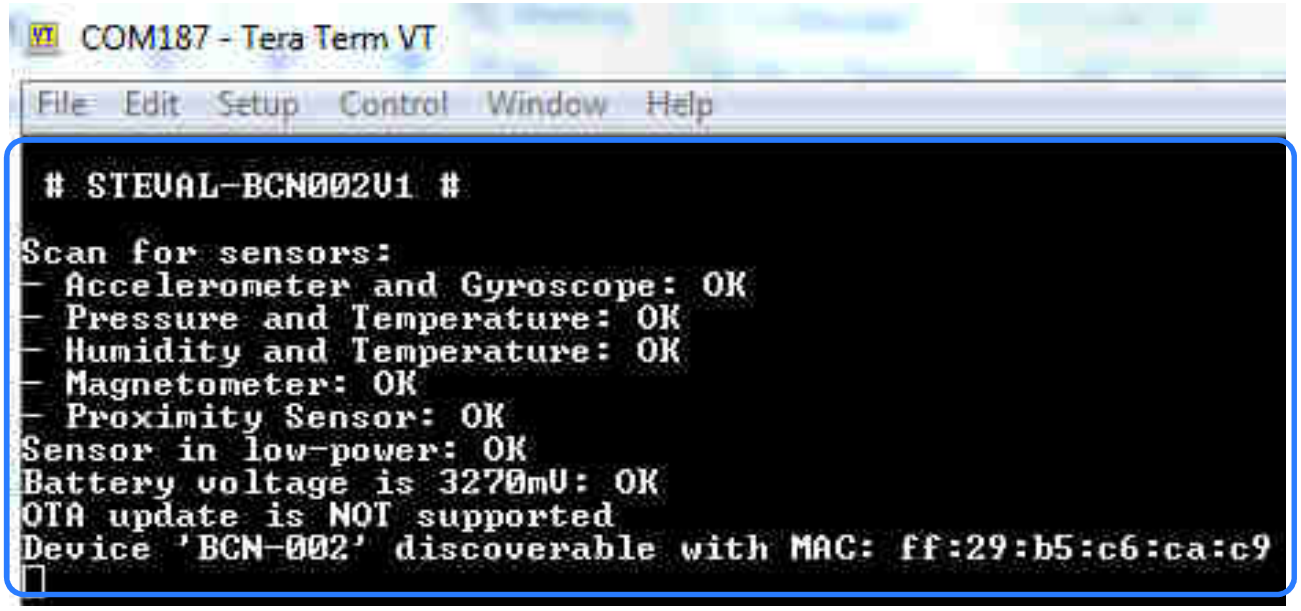


life.augmented

…Done!

Push SW1 button on the daughterboard





- If you see the output above, **Tera Term** is now properly configured

life.augmented

Lab 2

Connect to the ST BLE Sensor App

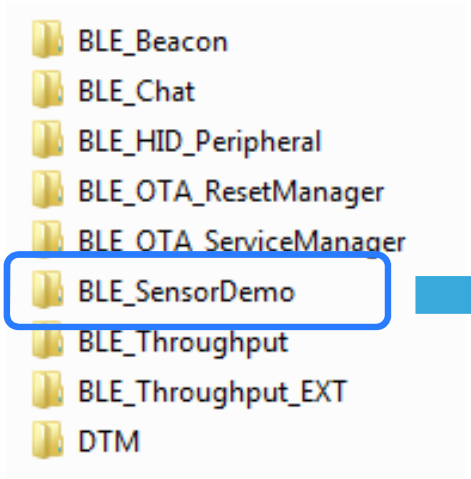
life.augmented

Customize YOUR STEVAL-BCN002V1

life.augmented

BLE_SensorDemo Application

1. In the BlueTile SDK browse the following path: STEVAL-BCN002V1 DK 1.1.0\Project\BLE_Examples



The BLE_SensorDemo embedded application is the main reference

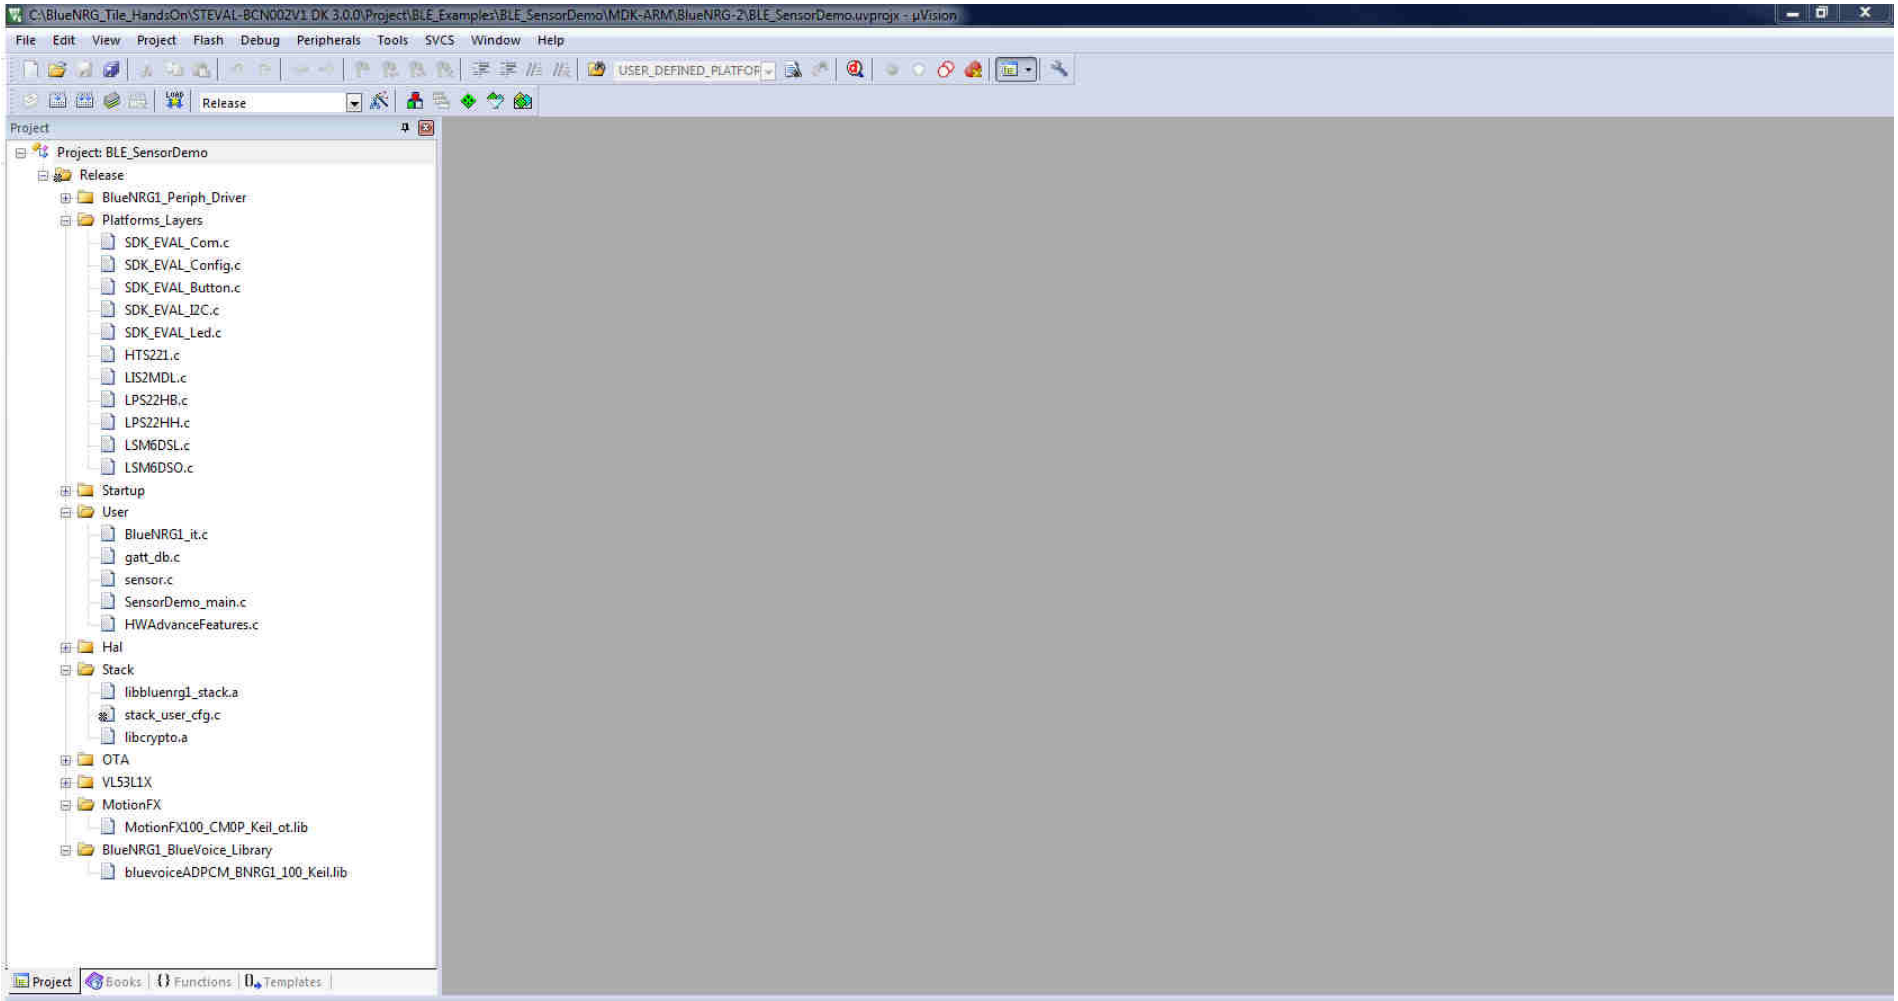
Integrated Development Environment

Arm Keil MDK

- **MDK**: **M**icrocontroller **D**evelopment **K**it
  - Complete software development environment from Arm for a wide range of Arm Cortex-M based microcontroller devices.
  - MDK includes the **µVision IDE**, **debugger**, and **Arm C/C++ compiler**

- A **FREE** license is available for ST BlueNRG-2
  - Go **HERE** to get the free license!

BLE_SensorDemo Application



Application Structure

Application source code
- **Main**
- **ATTRIBUTE Database**
- **Application**

Hardware Abstraction Layer and sleep management

BLE Stack library – provided in binary format

Sensor Data Fusion library

Voice over BLE library

life.augmented

A Look at the Main Application

```
int main(void) {
```

`SystemInit();` Remap the vector table and configure all the interrupts priority

`SdkEvalIdentification();` Identifies STEVAL or custom PCB

`PlatformInit();` HW peripherals initialization

`BlueNRG_Stack_Initialization(&BlueNRG_Stack_Init_params);` BLE stack initialization

`Sensor_DeviceInit();` Sensors initialization

`Set_DeviceConnectable();` Set device in advertising

`while(1){` Start of while loop

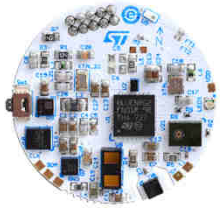
`BTLE_StackTick();` Advances the stack FSM

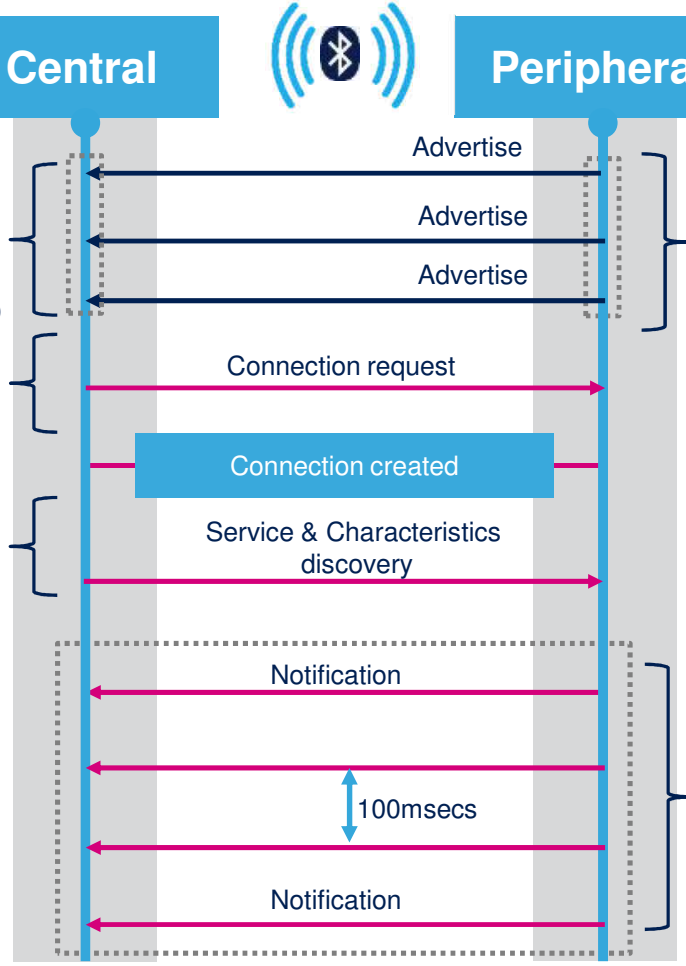
`User_AppTick();` Advances the application FSM. **THIS IS DEVELOPERS USER SPACE!**

```
  } // end while(1)
}
```

life.augmented

BLE Flow on the LAB





Step 2: **Scan**

Master is in discovery mode looking for a **specific** slave to connect to

Step 3: **Connection request**

Step 4: **Services & Chars discovery**

Master (Client) starts the BLE Service and Characteristics discovery procedure to understand the Server ATT DB

Step 1: **Advertising**

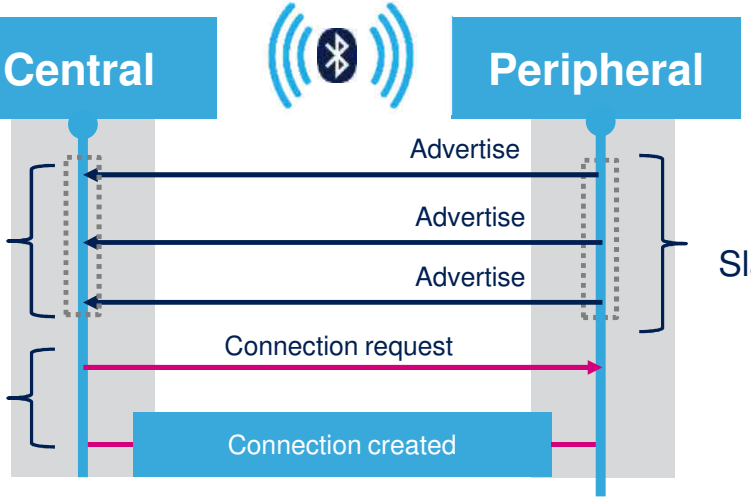
Slave is in Peripheral mode and sends ADV_IND PDU

Step 5: **Data flow**

Slave (Server) starts sending periodically (100 ms) to the master, **notifications packets** of sensors values (acc&gyro and pressure)

life.augmented

Advertising and Scanning



Step 2: **Scan**
Master is in discovery mode looking for a **specific** slave to connect to

Step 3: **Connection request**

Step 1: **Advertising**
Slave is in Peripheral mode and sends ADV_IND PDU

Master:
needs an app for discovering the slave device in advertising

Off-the-shelf app: e.g.

LightBlue® Explorer

https://itunes.apple.com/us/app/lightblue-explorer/id557428110?mt=8

Custom app: e.g.

ST15

life.augmented

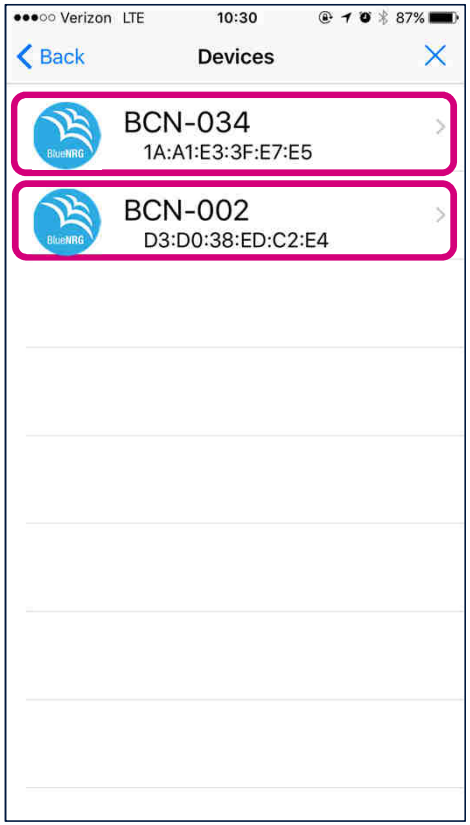
ST BLE Sensor Scan Results

Len	Type	Protocol version	Device ID	Feature Mask	Device MAC	Len	Type	Local Name



Each ST Platform is recognized by means of a Device ID

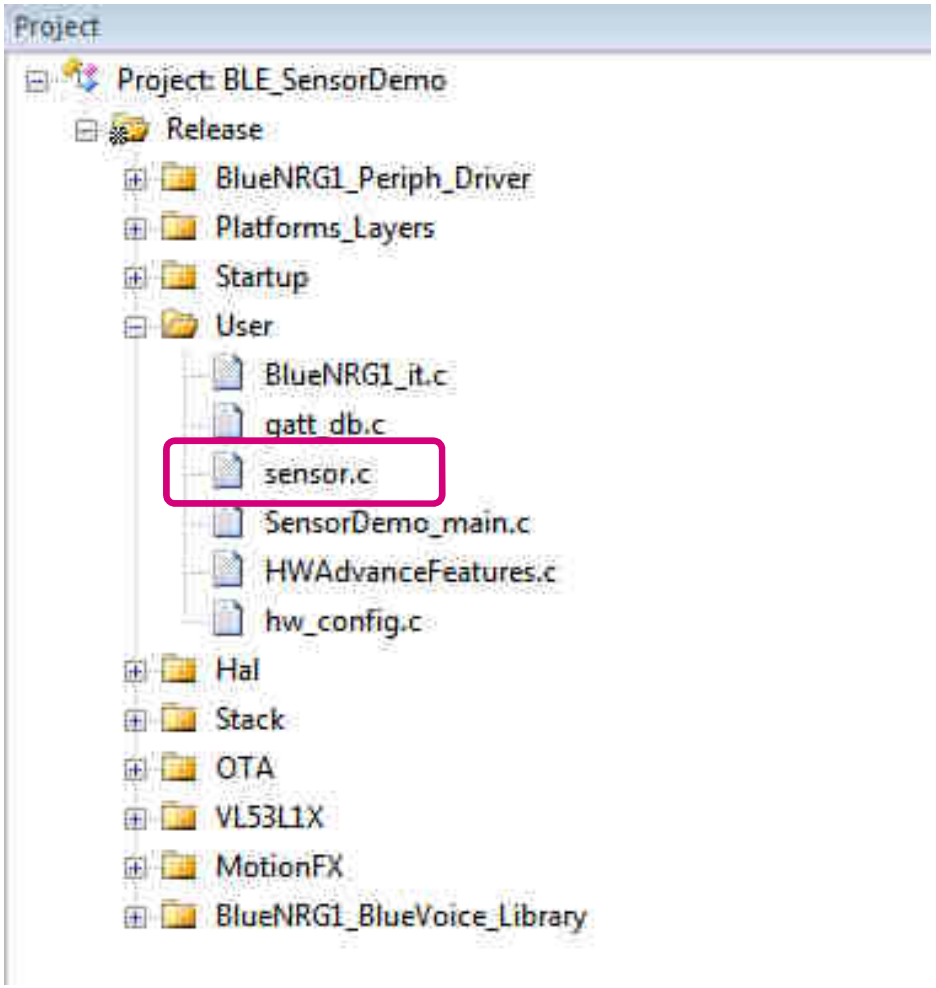
(for STEVAL-BCN002V1 it is equal to 0x05)

Users can distinguish their node from the Local Name

BlueNRG

life.augmented

Customize Your BlueTile



Customize Your BlueTile

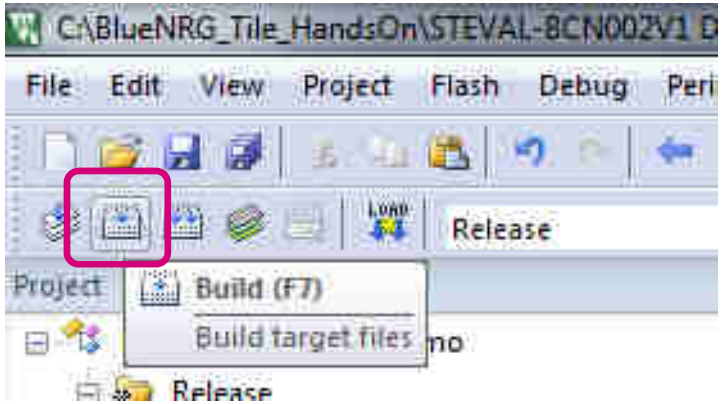
Modify the **local name** in the advertisement payload

1. In the file **sensor.c** **go to** **line 52**
2. **“BCN-002” is the default local name value**
3. **You can modify it as you prefer with a 7-characters string**

```
52  #define DEFAULT_NAME_ALLMEMS        'B','C','N','-','0','0','2'
```

Build the New Code

1. Click on the **Build button** (top left corner) or hit **F7** on your keyboard
2. In the **Build Output** window (bottom) wait for the build to be completed.
   - **BLE_SensorDemo.bin** created
   - "**0 Error(s), 0 Warning(s)**" message appear



```
Build Output
compiling vl53l1_wait.c...
compiling vl53l1_register_funcs.c...
compiling vl53l1_platform.c...
linking...
Program Size: Code=121908 RO-data=1428 RW-data=1136 ZI-data=21252
FromELF: creating hex file...
After Build - User command #1: fromelf.exe --bin ..\..\..\..\..\..\HandsOn\BLE_SensorDemo_PrjOutput\BLE_SensorDemo.axf --output ..\..\..\..\..\..\HandsOn\BLE_SensorDemo_PrjOutput\BLE_SensorDemo.bin
"..\..\..\..\..\..\HandsOn\BLE_SensorDemo_PrjOutput\BLE_SensorDemo.axf" - 0 Error(s), 0 Warning(s).
Build Time Elapsed:  00:00:12
```

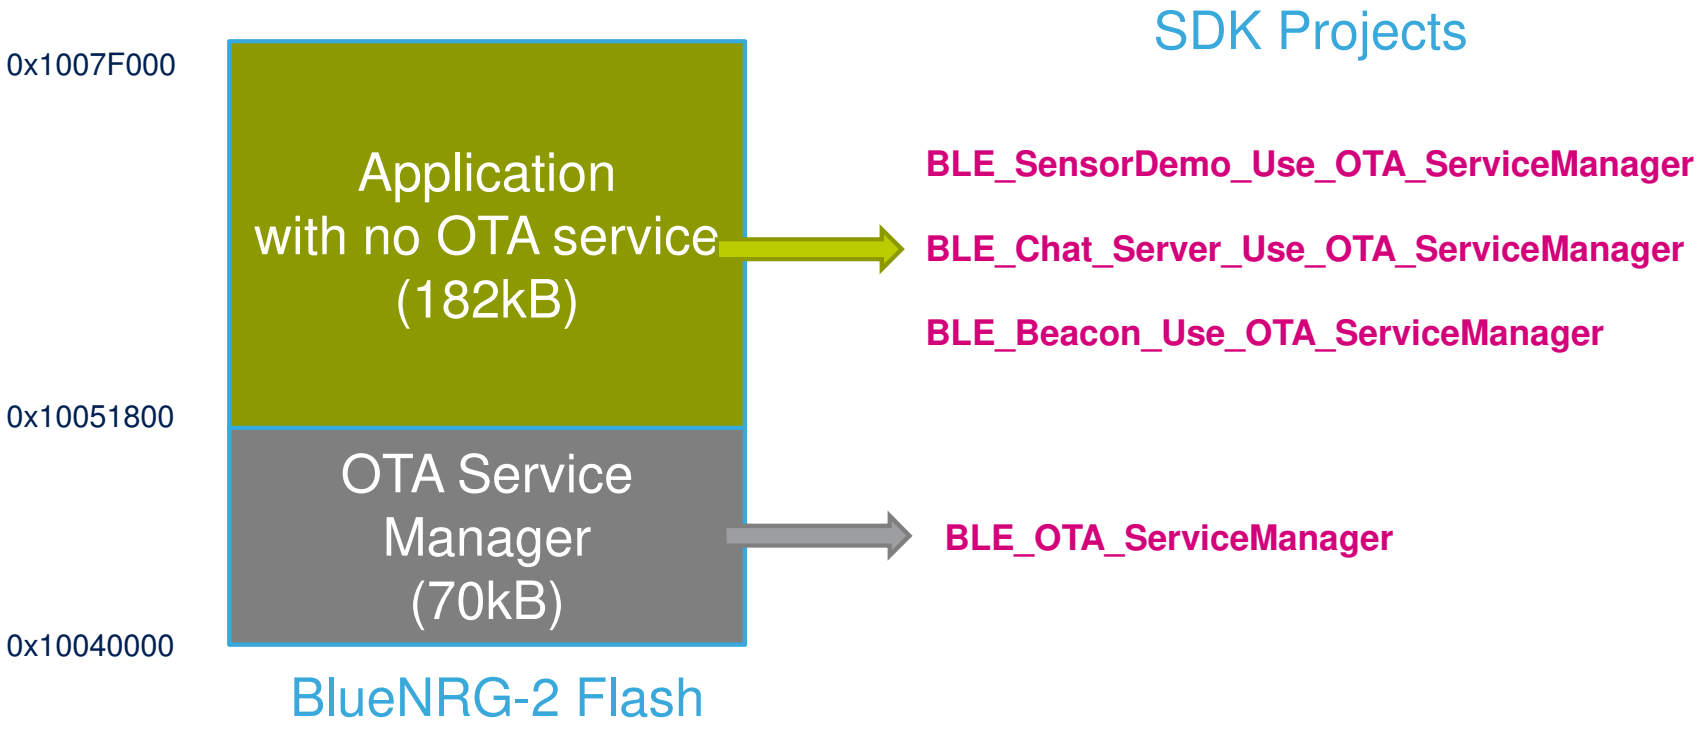
Flash Memory Layout 2/2

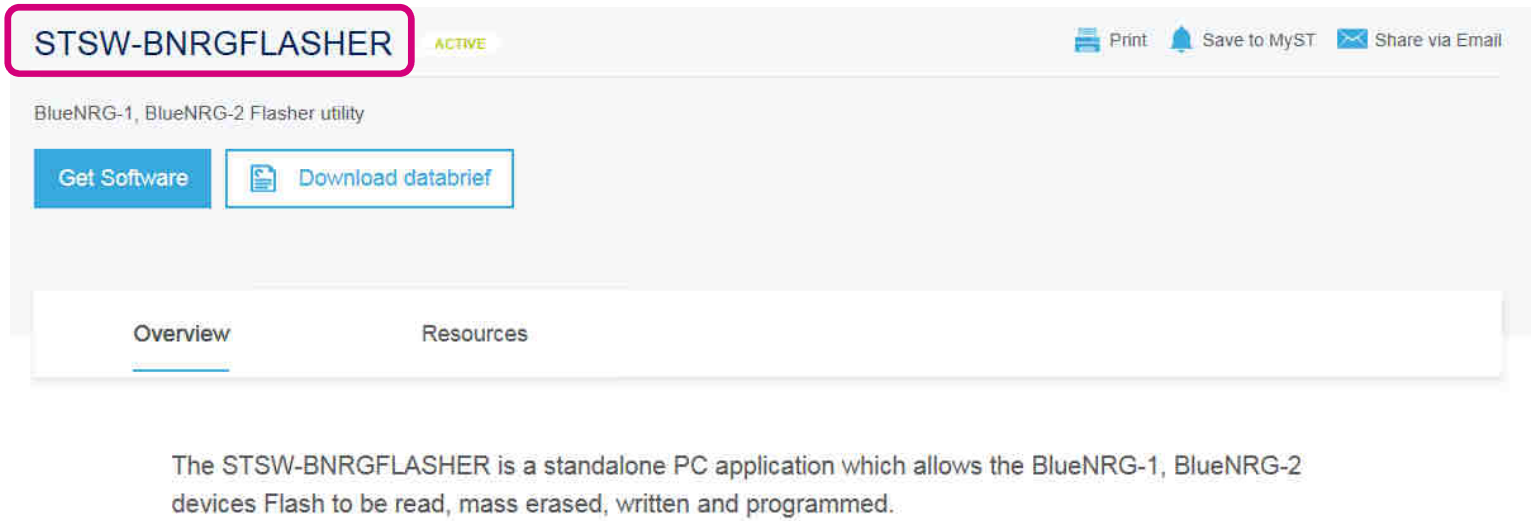


life.augmented

UART Bootloader: Use the BlueNRG Flasher Utility

- On st.com at this link:

  https://www.st.com/en/embedded-software/stsw-bnrgflasher.html

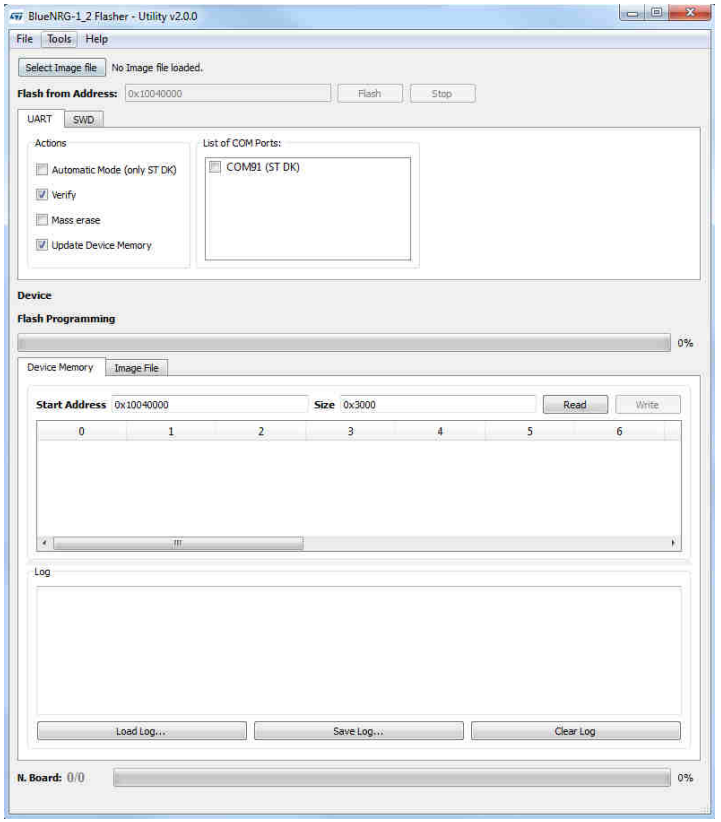


Open the BlueNRG Flasher Utility

1. **Go to**

   C:\Program Files (x86)\STMicroelectronics\BlueNRG-1_2 Flasher Utility 3.0.0\Application

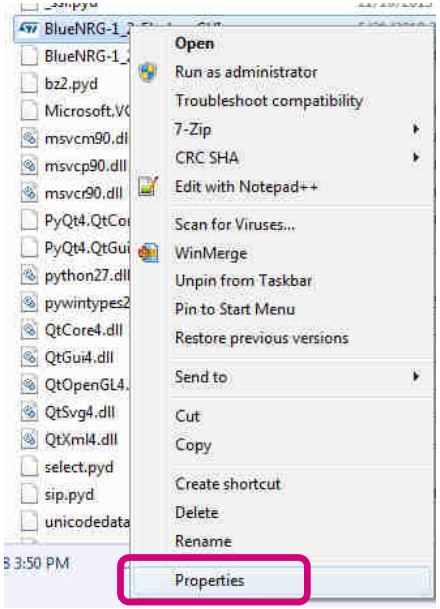
1. **Double click** on **BlueNRG-1_Flasher_GUI.exe**

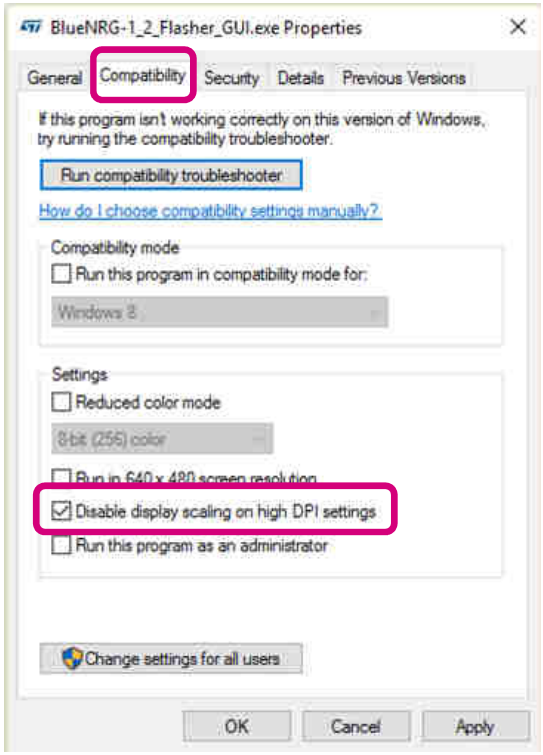


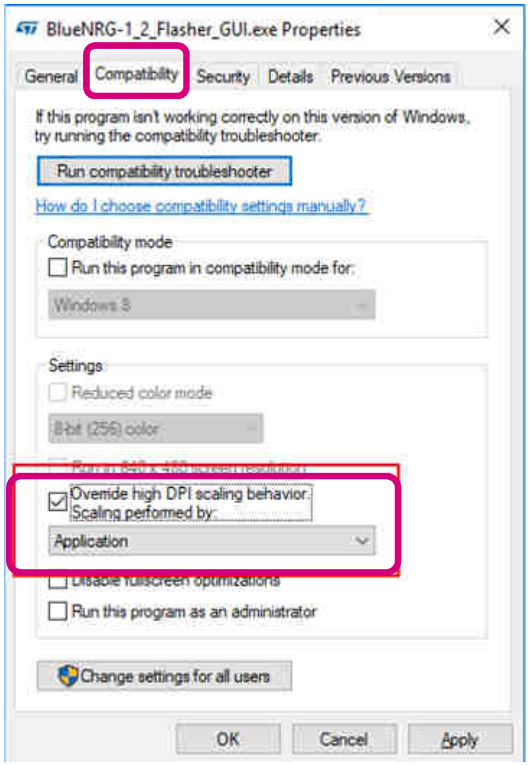
life.augmented

For HD Screens…If You've Screen Resolution problems

- **Right Click** on the .exe file and **select** **Properties**
- In the **Compatibility** tab **select** either **Disable display scaling…** or **Override high DPI scaling… –> Application**

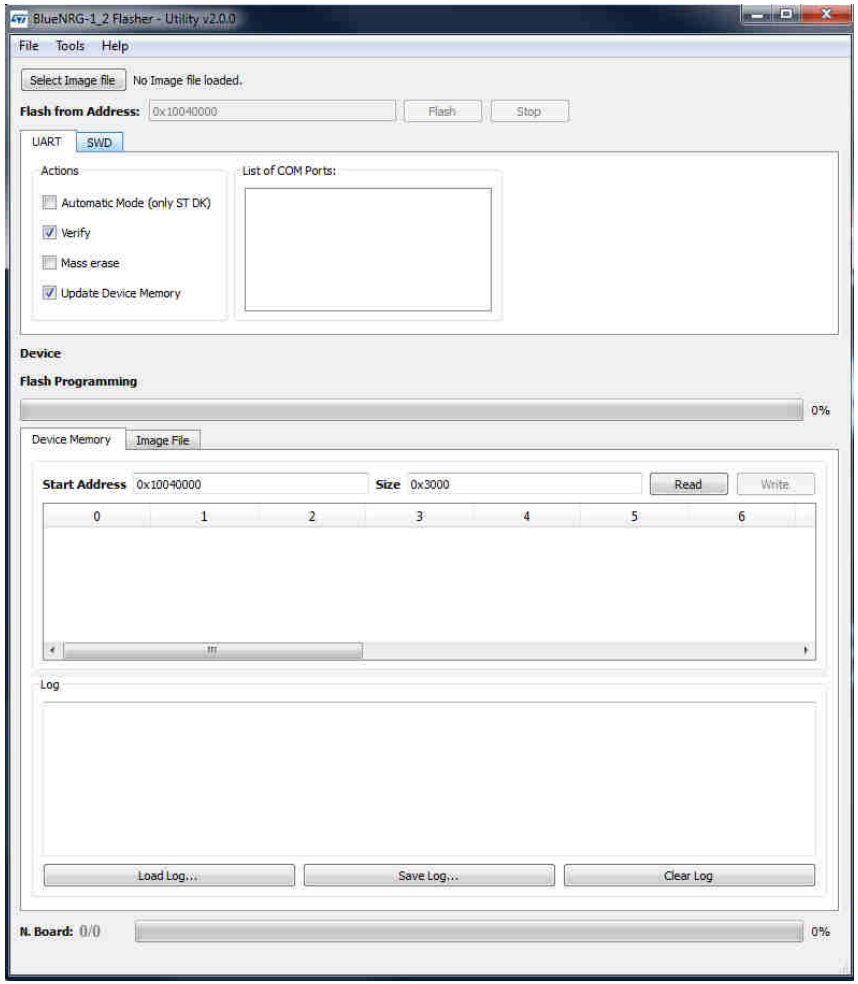






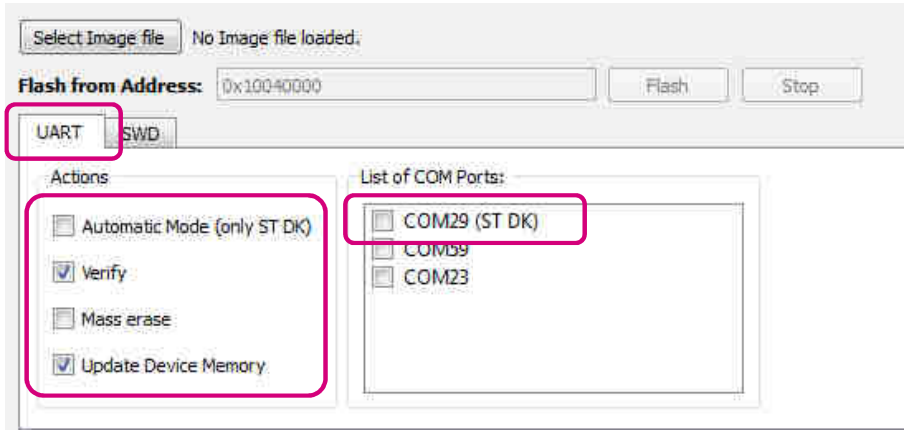
life.augmented

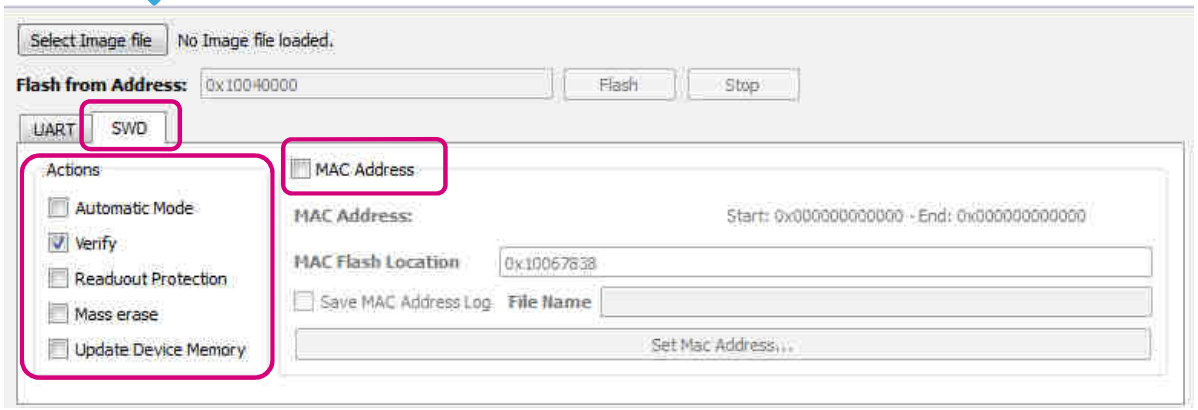
BlueNRG Flasher Utility



UART

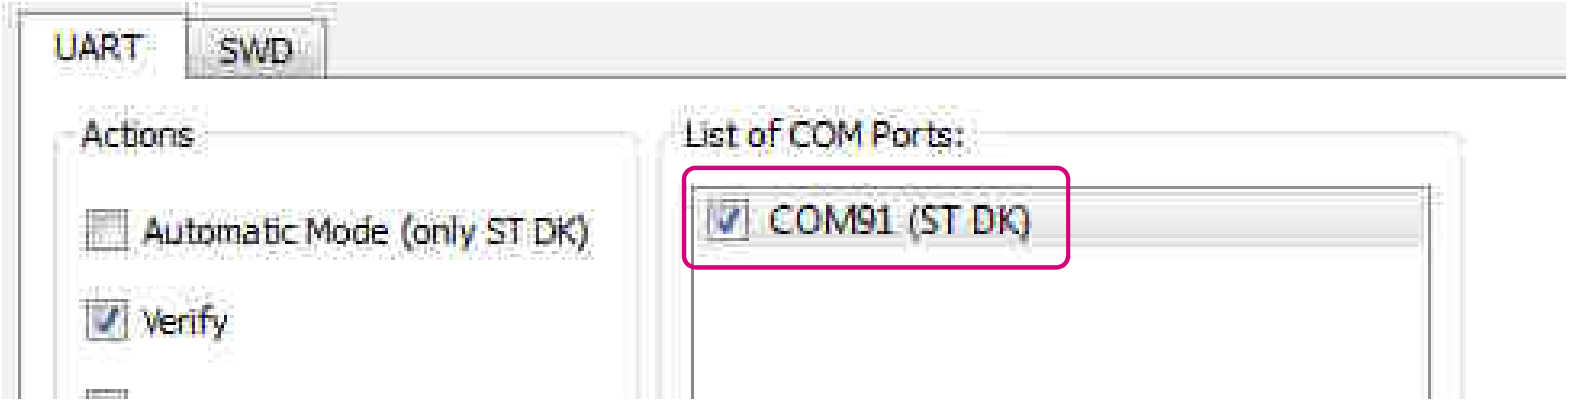
SWD





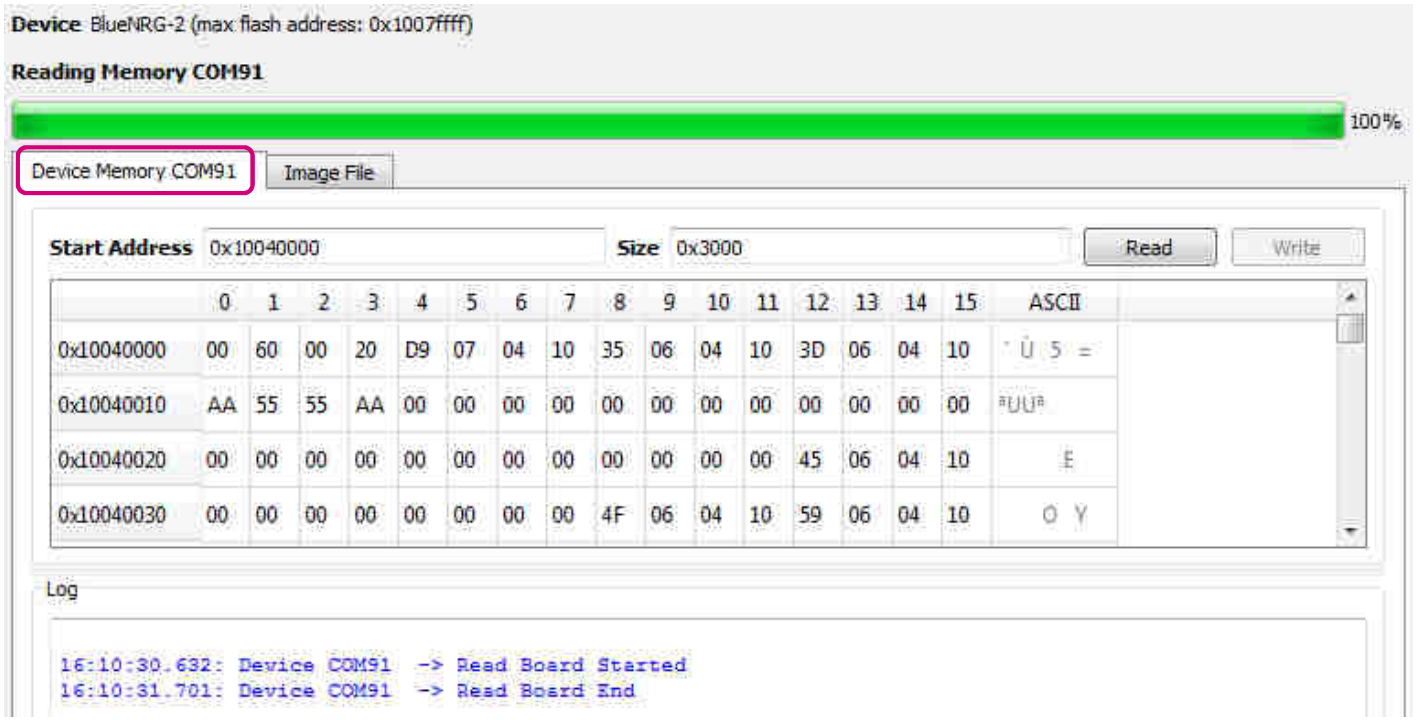
Flash the BlueNRG-2 1/6

1. **Select the COM port** labeled **(ST DK)**



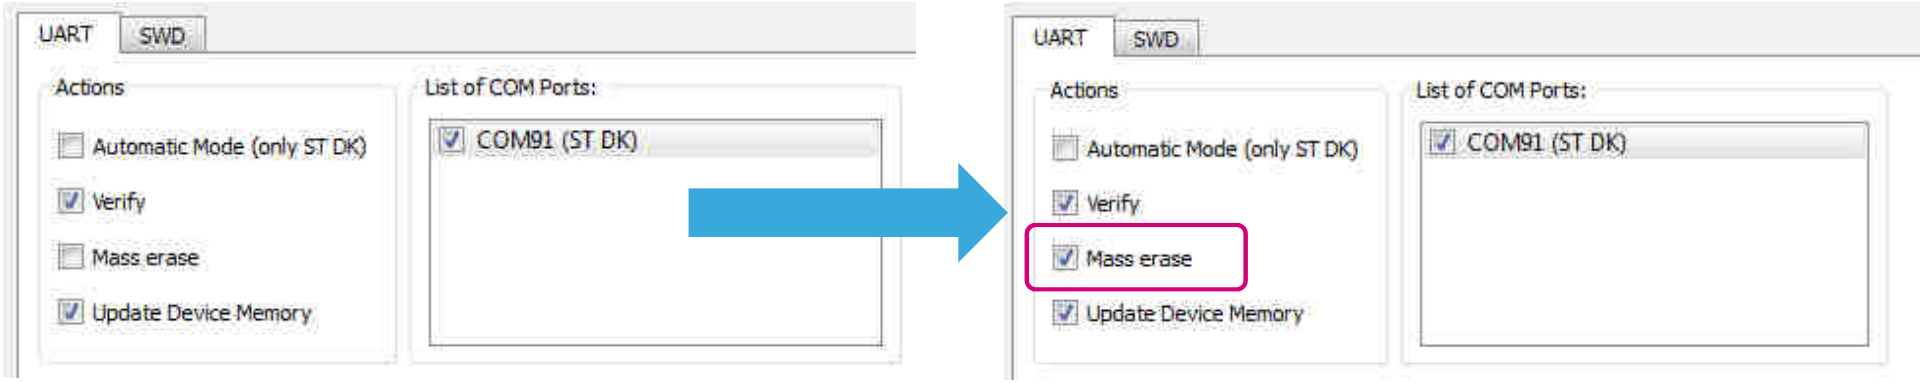
Flash the BlueNRG-2 2/6

2. **Device Memory** will populate with data



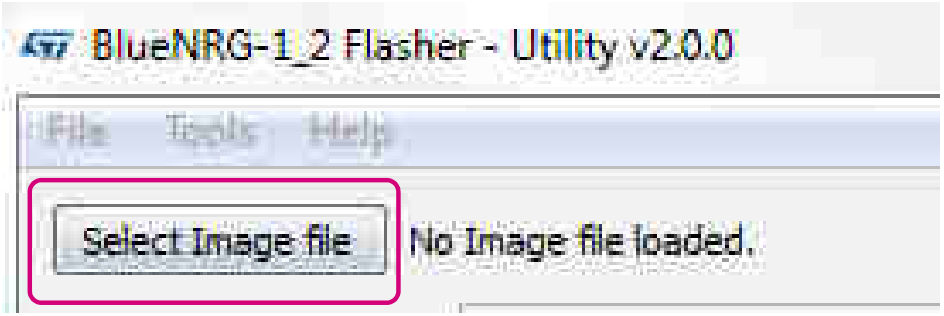
Flash the BlueNRG-2 3/6

3. Select Mass Erase



Flash the BlueNRG-2 4/6

4. **Click** on the **Select Image file** button



5. And **browse** the following **path**

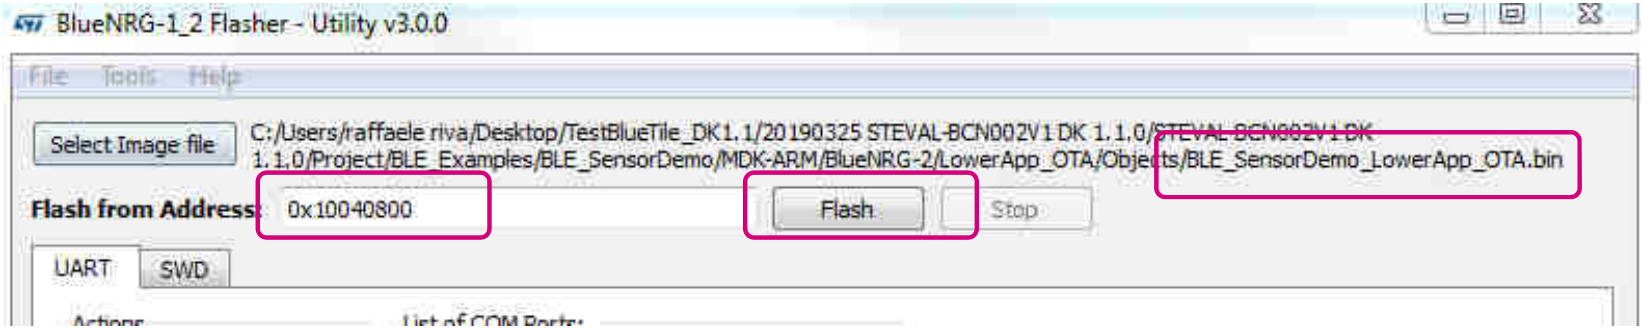
life.augmented

Flash the BlueNRG-2 5/6

6. **Select** the binary file (e.g. BLE_SensorDemo_LowerApp_OTA.bin) and **click** **Open**

7. Insert the correct **start address** (e.g. 0x10040800 for Lower App)

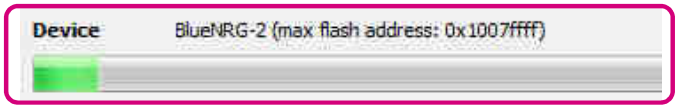
8. **Click** on the **Flash** button



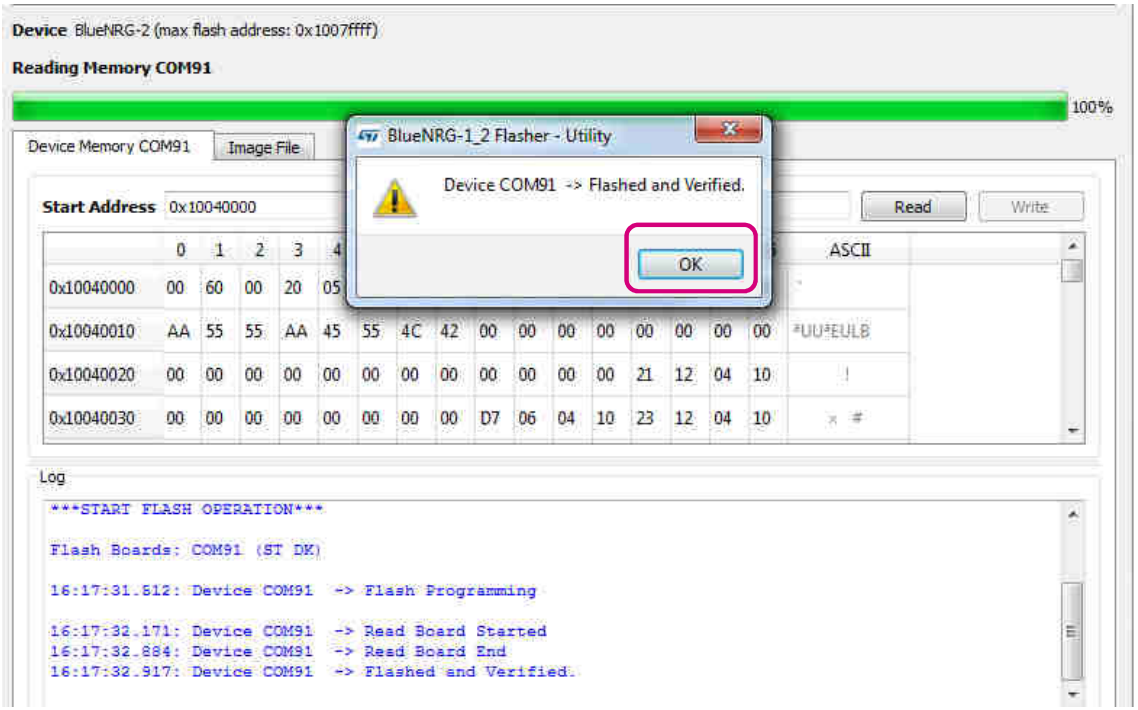
life.augmented

Flash the BlueNRG-2 6/6

9. Flashing starts: **green bar** proceeding



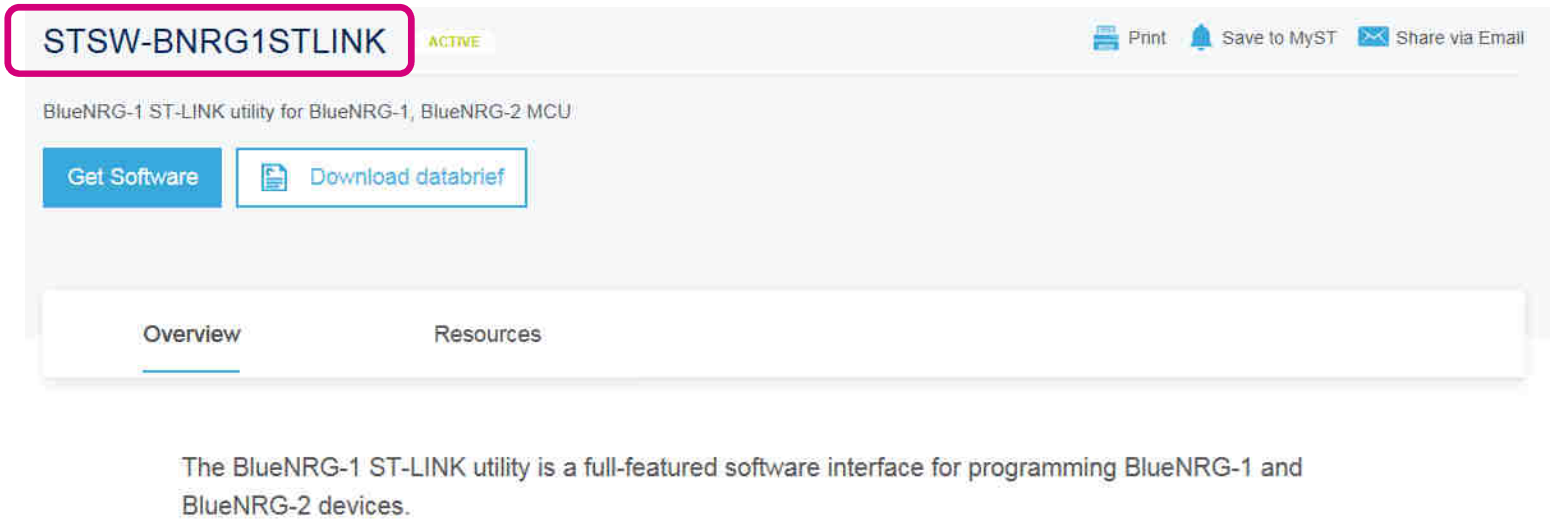
10. **Wait** for the **pop-up** window and **click** on **OK**



SWD: Use BlueNRG ST-LINK Utility

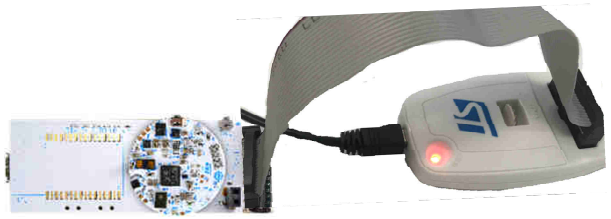
- On st.com at this link:

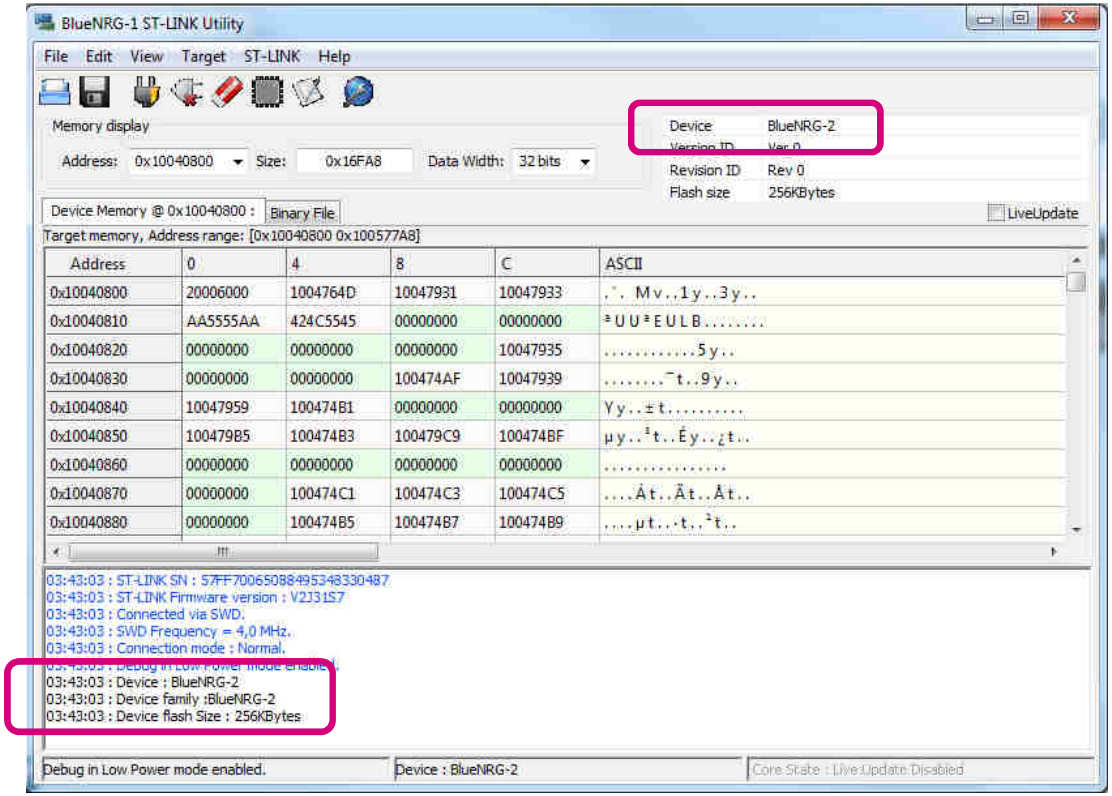
  https://www.st.com/en/embedded-software/stsw-bnrg1stlink.html



Programming Embedded Flash

1. SWD interface + ST-LINK





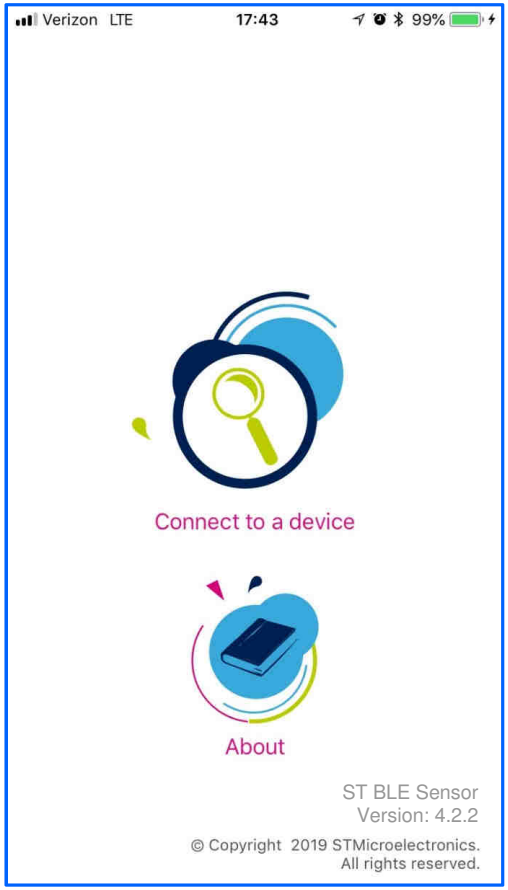
life.augmented

Open the ST BLE Sensor App

Download on the App Store

GET IT ON Google Play

Launch the **ST BLE Sensor** app previously installed



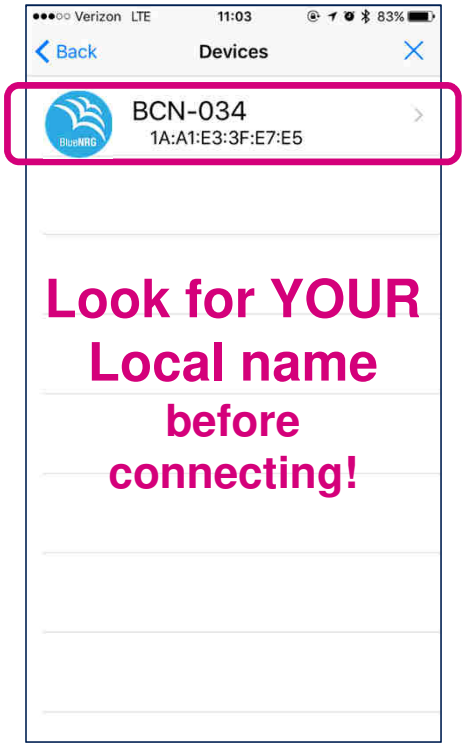
Note: in the following slides all the pictures are referred to the iOS version of the ST BLE Sensor app. The Android version is slightly different

life.augmented

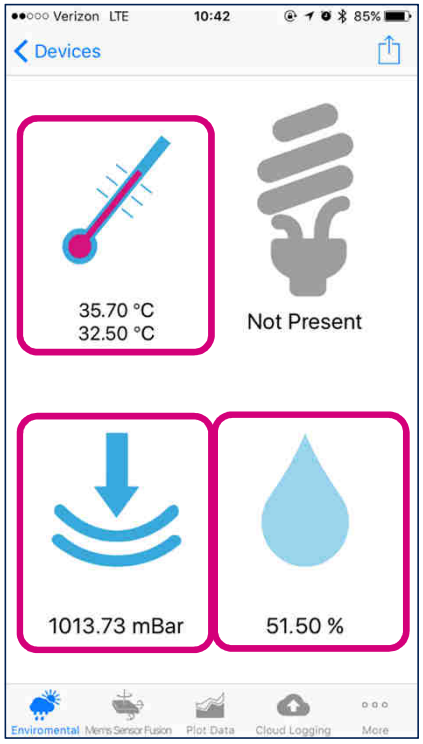
Connect Using the ST BLE Sensor App

1 **Tap “Connect to a device”**

2 **Select your BlueTile**



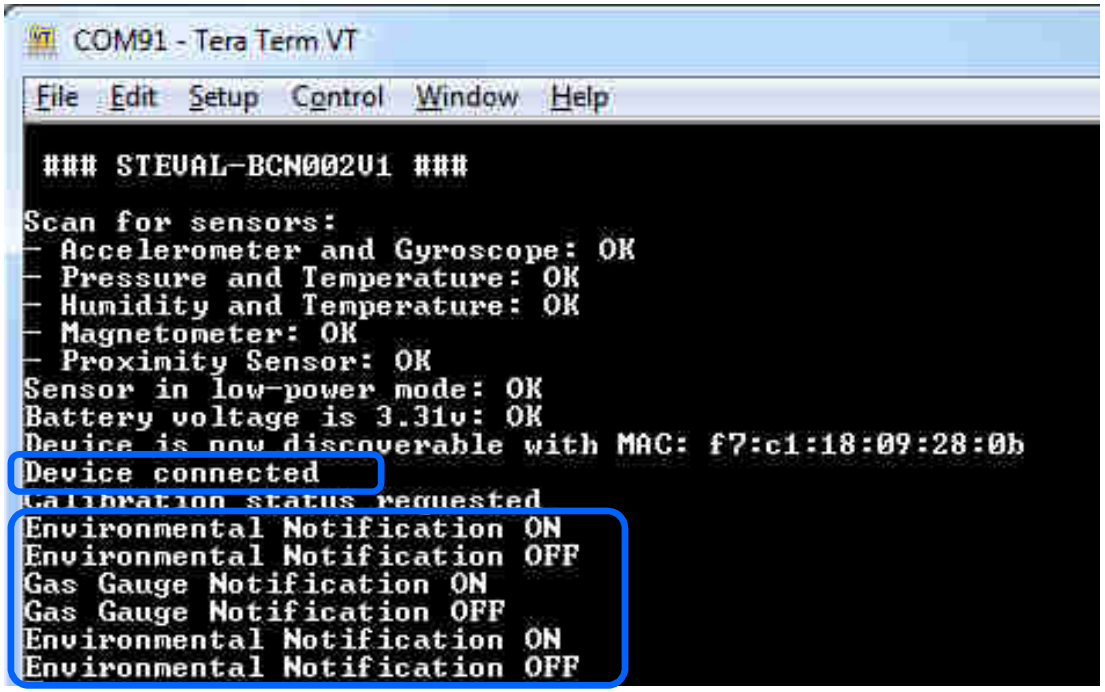
3 **You are connected**



Blow air on the Temperature sensor to change the temperature and humidity values

Tera Term Output

- **“Device connected”** will appear as connection is created
- Each time user moves on different tabs/screens in the app:
  - **BLE notifications** on different BLE characteristics **are enabled**.
  - **Environmental and Gas Gauge/Battery characteristics** are involved



ST BlueMS Protocol

In file **sensor.c**

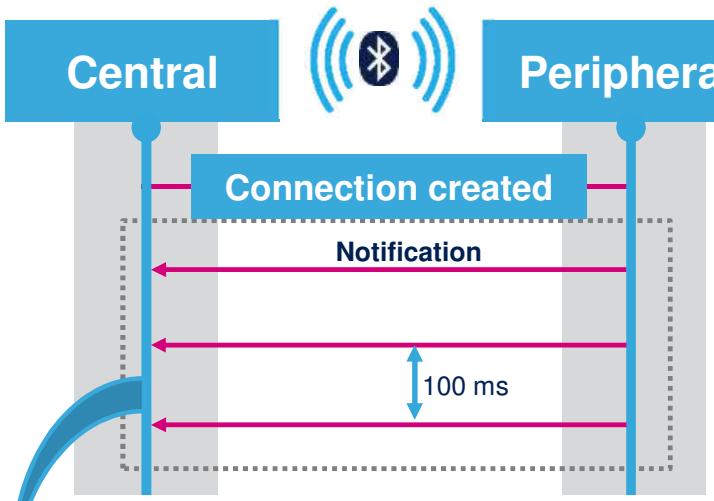
Value) Data) //EnvChar Value

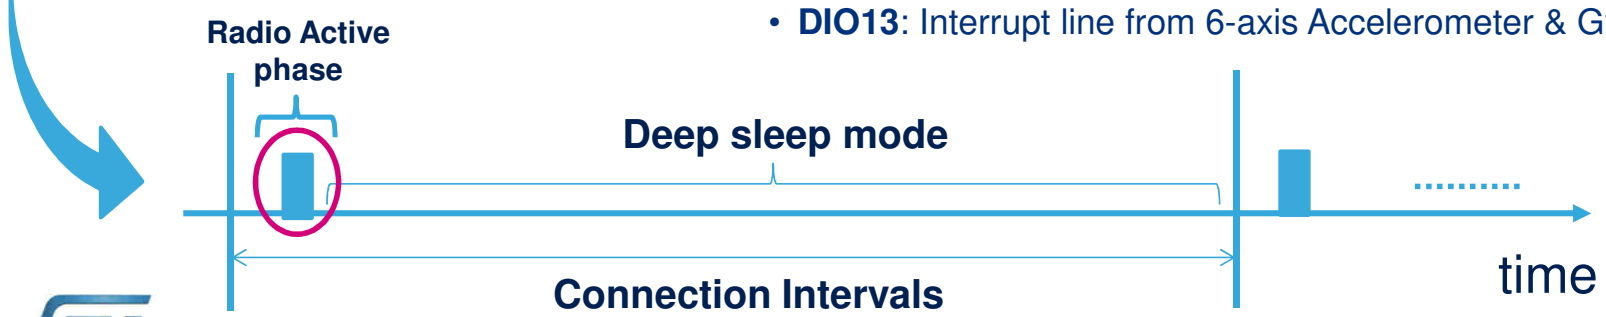
Description	Where
If notifications (or indications) are enabled on the characteristic, this API sends a notification (or indication) to the client.	GATT server

life.augmented

Cortex-M0 Sleep Management

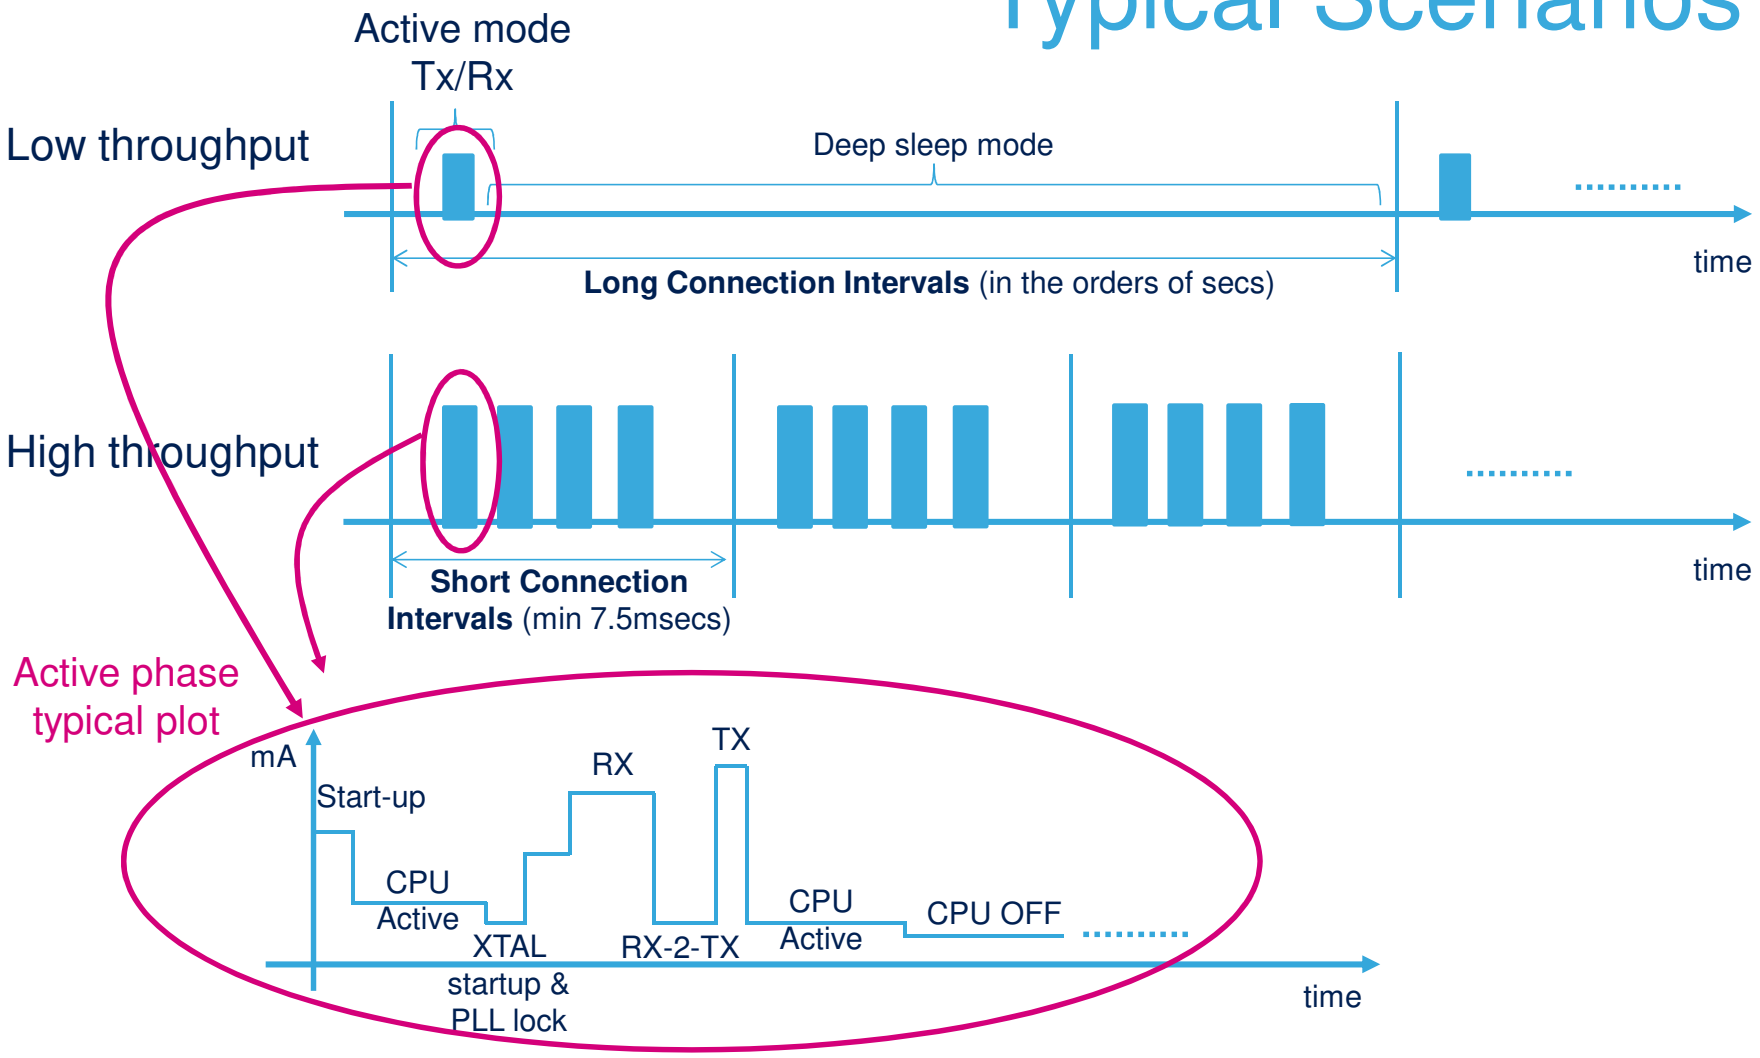


- **Sleep mode** managed through specific a **library** and **API**
  - BlueNRG_Sleep(sleepMode, gpioWakeBitMask, gpioWakeLevelMask)
- **4 wake-up sources**: **timers**, **DIO11**, **DIO12** and **DIO13**
  - **Timers**: 4 virtual timers mapped on 2 physical timers managed by the radio IP
  - **DIO11**: Interrupt line from UART RX or SW1 button
  - **DIO12**: Interrupt line from Magnetometer
  - **DIO13**: Interrupt line from 6-axis Accelerometer & Gyroscope



life.augmented

Typical Scenarios



life.augmented

Low Power Modes

- **Deep sleep mode** can represent most of the application time.
- Efficient management of sleep mode significantly lowers the avg power consumption.

BlueNRG-2 flexible low power architecture

Sleeping Mode	Consumption	Notes
RUNNING	1.9mA	Core running
CPU HALT	1.5mA	WFI instruction
WAKETIMER	900nA	GPIOs and Timer Wakeup
NOTIMER	**500nA**	GPIOs only Wakeup

Highest pwr

Low Power library combines requests coming from the application with the radio operating mode

Lowest pwr

life.augmented

Context Save/Restore

- BlueNRG-2 Low Power Library **handles autonomously entering and exiting to/from the sleep mode**.
- **The library saves peripherals configurations and application context** before entering deep sleep, and **restores the context** on exiting from low power state:
  - **CPU returns to execute the next instruction after the low power function call**
  - **No need to re-initialize peripheral and radio stack**
  - **RAM retention is guaranteed**

NO need for the application to worry about sleep management and RAM retention!

life.augmented

BlueNRG

Lab 5

9-axis Acc+Gyro+Mag Sensor Data Fusion

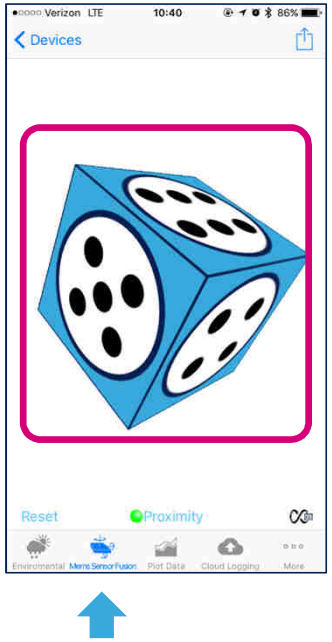
life.augmented

Goal

- In this example we are going to demonstrate how to:
  - **Enable** the embedded sensor data fusion library
    - Input: raw Acc+Gyro+Mag sensor data
    - Output: quaternions
  - **Scale the quaternions value** by a scaling factor proportional to proximity detection
  - **Send** scaled data fusion information through **BLE notifications packets** to the ST BLE Sensor app client

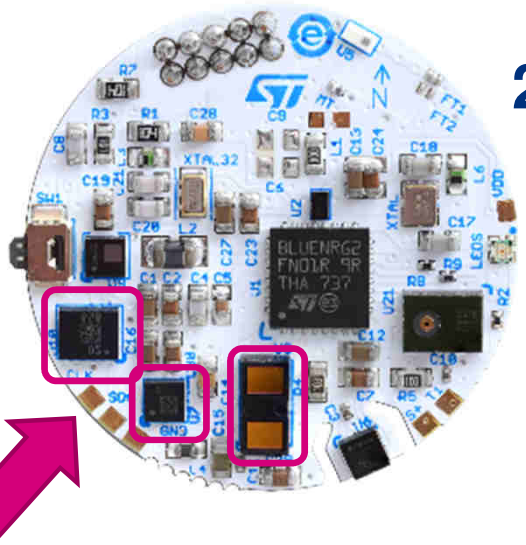
Sensor Data Fusion

1. **Enable** Sensor Fusion library
2. **Send** quaternions information through **BLE notification packet**

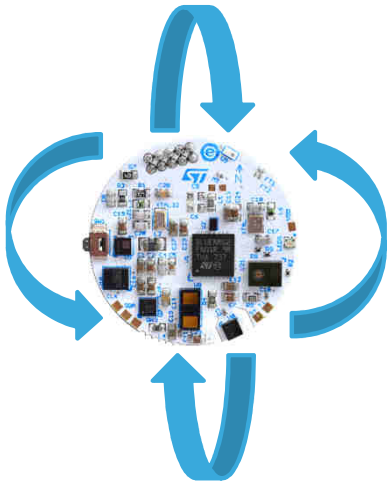


Notification Packet

QUATERNIONS



Sensors used by data fusion:
Acc+Gyro+Mag and Proximity



life.augmented

Code Modifications

1. **Enable Sensor Data fusion library**
2. **Enable proximity sensor**
3. **Send quaternions data** – scaled by proximity sensor data - through **BLE notifications packets**

Proximity Sensor - VL53L1X

3rd gen **ToF sensor** with lens for **long distance** ranging & ROI selection

Product highlights

OLGA: **4.9 x 2.5 x 1.56 mm**
FoV : 27°
Compatible footprint with VL53L0X

Enhanced performances:

- Full FoV ranging : **400cm+** (white target, no IR)
- **Programmable FOV:** SPAD zone selection – full-screen to 4x4

Cutting-edge module and silicon :

- **Fastest miniature ToF product in the market** up to 50Hz
- **Integrated lens** for longer range and better ambient light immunity
- **Programmable settings** to best fit customer's application:
  - Low power with interrupts for user / object detection
  - Long distance ranging
  - High accuracy for small movement detection

Applications

Presence user detection

- Autonomous mode with interrupts
- Low-power
- Long distance 400cm+
- PC, tablets, IoT, portable handsets, security

Obstacle detection:

- Robots: Obstacle avoidance
- Vacuum cleaners: Wall following, cliff detection
- Drones: Take-off and landing, Ceiling detection

Accurate objects distance scanning

- Vending machines: control of objects in racks
- Coins dispensers: coins counting
- Smart shelves: Consumer scanning

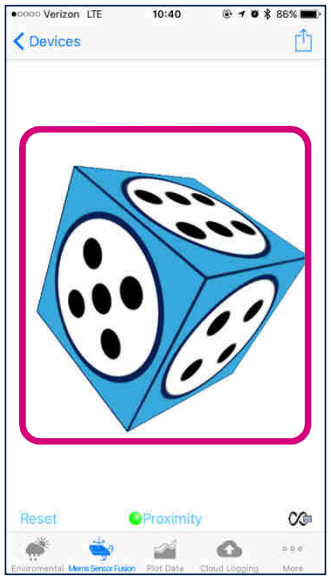
Sensor Data Fusion

Sensor Fusion **enabled**



Try **static** position: no drift, the cube is perfectly still

- In steady static position the **acc** and **mag** enable an accurate orientation estimate
- acc vibrations and mag bias and interferences are **rejected or compensated by the motionFX library**

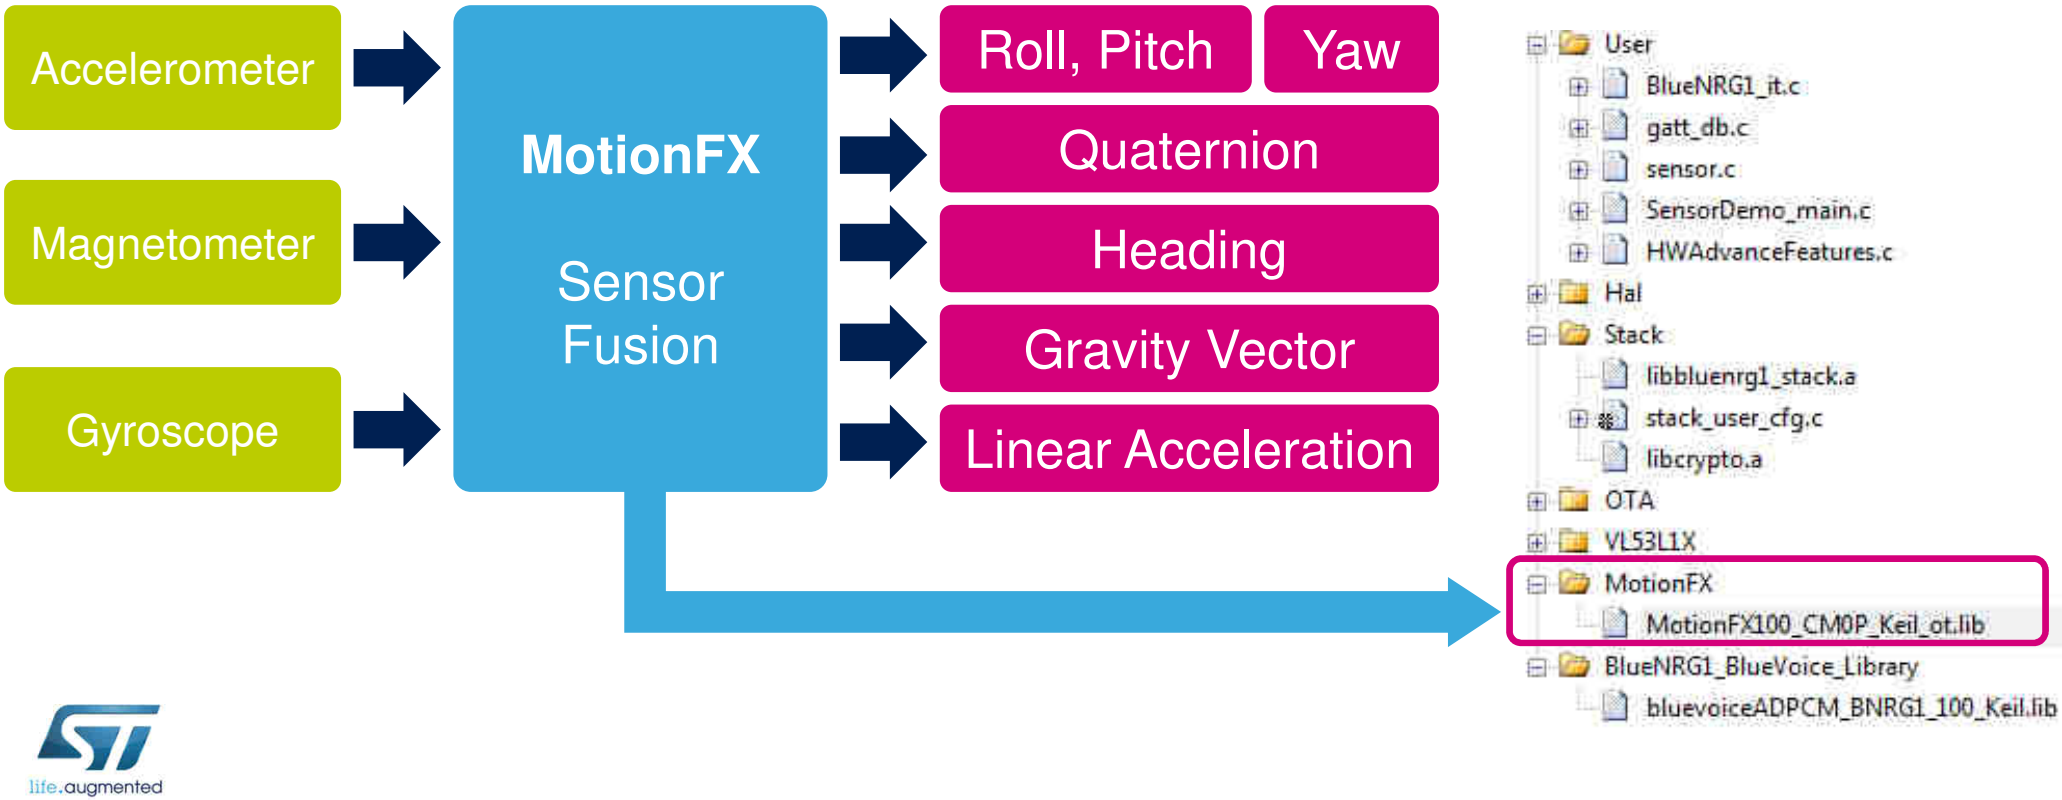
Try highly **dynamic** motion: perfect tracking

- In high dynamic motion the acc cannot be used, therefore the **gyro** is used to update the orientation
- gyro bias is **estimated and compensated at runtime** by the **motionFX** library

life.augmented

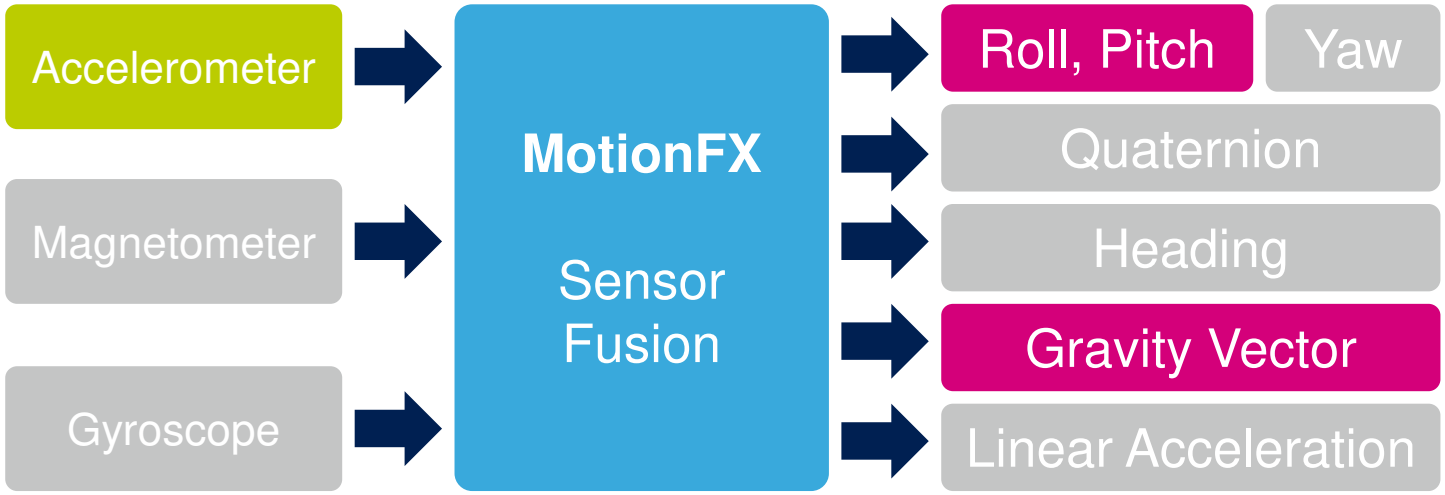
Sensor Data Fusion

MotionFX Library



Sensor Data Fusion

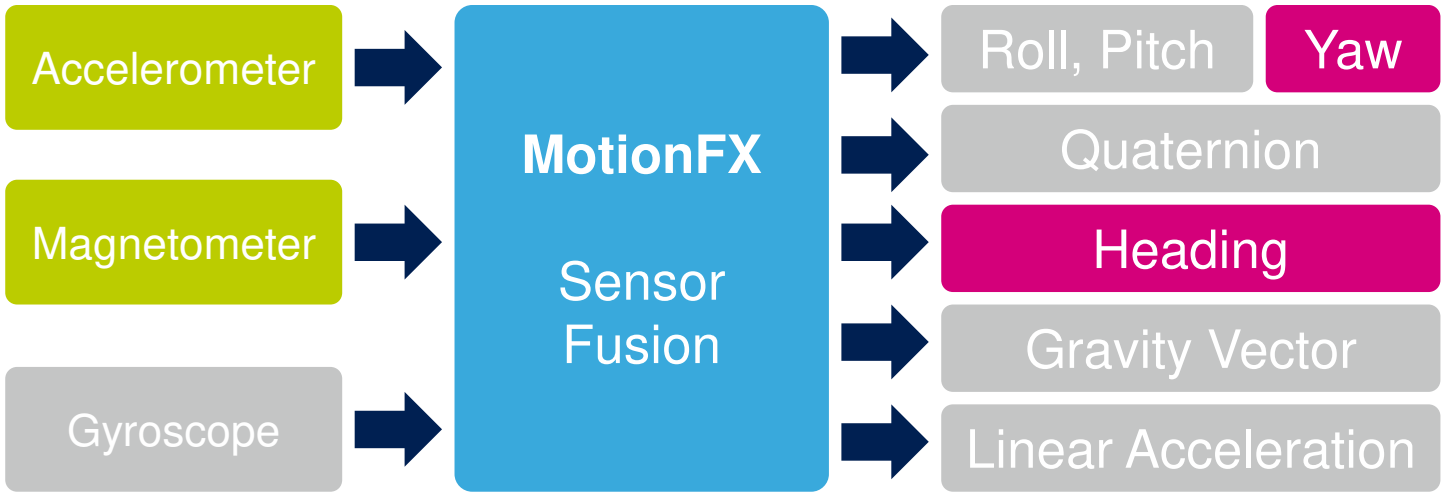
MotionFX Library



- **Accelerometer gives roll** and **pitch angles** and the **gravity vector**…but **only in static conditions**! (or low dynamics)

Sensor Data Fusion

MotionFX Library



- **Magnetometer gives yaw angle** and **heading**

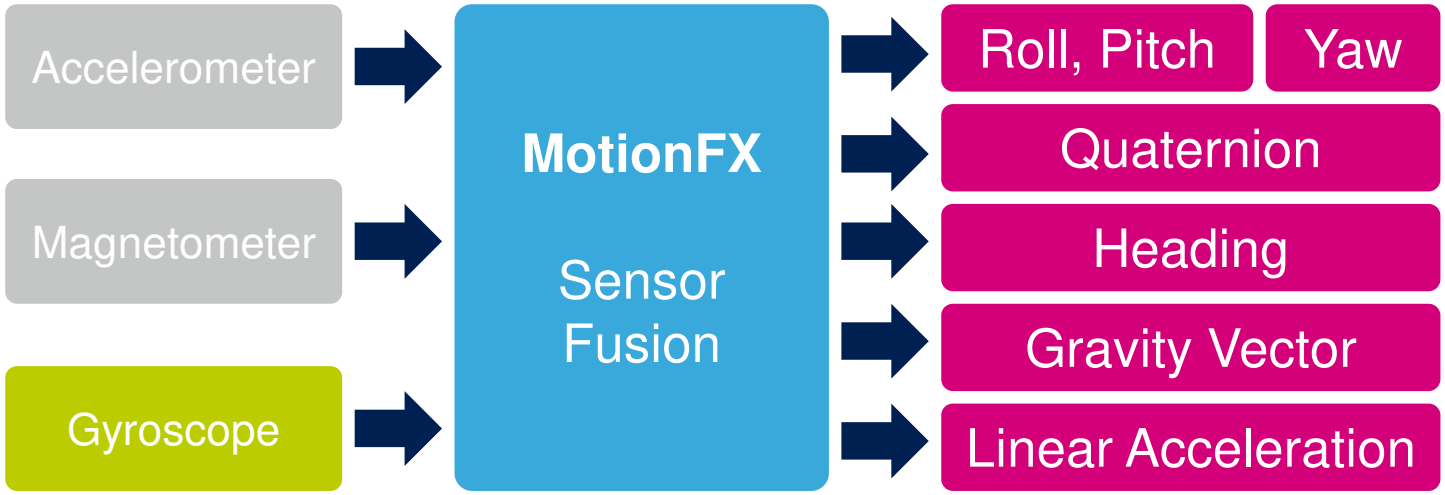
…but **only if tilt is compensated**: the accelerometer is needed!

…and **mag bias** (hard-iron) **must be compensated!**

life.augmented

Sensor Data Fusion

MotionFX Library

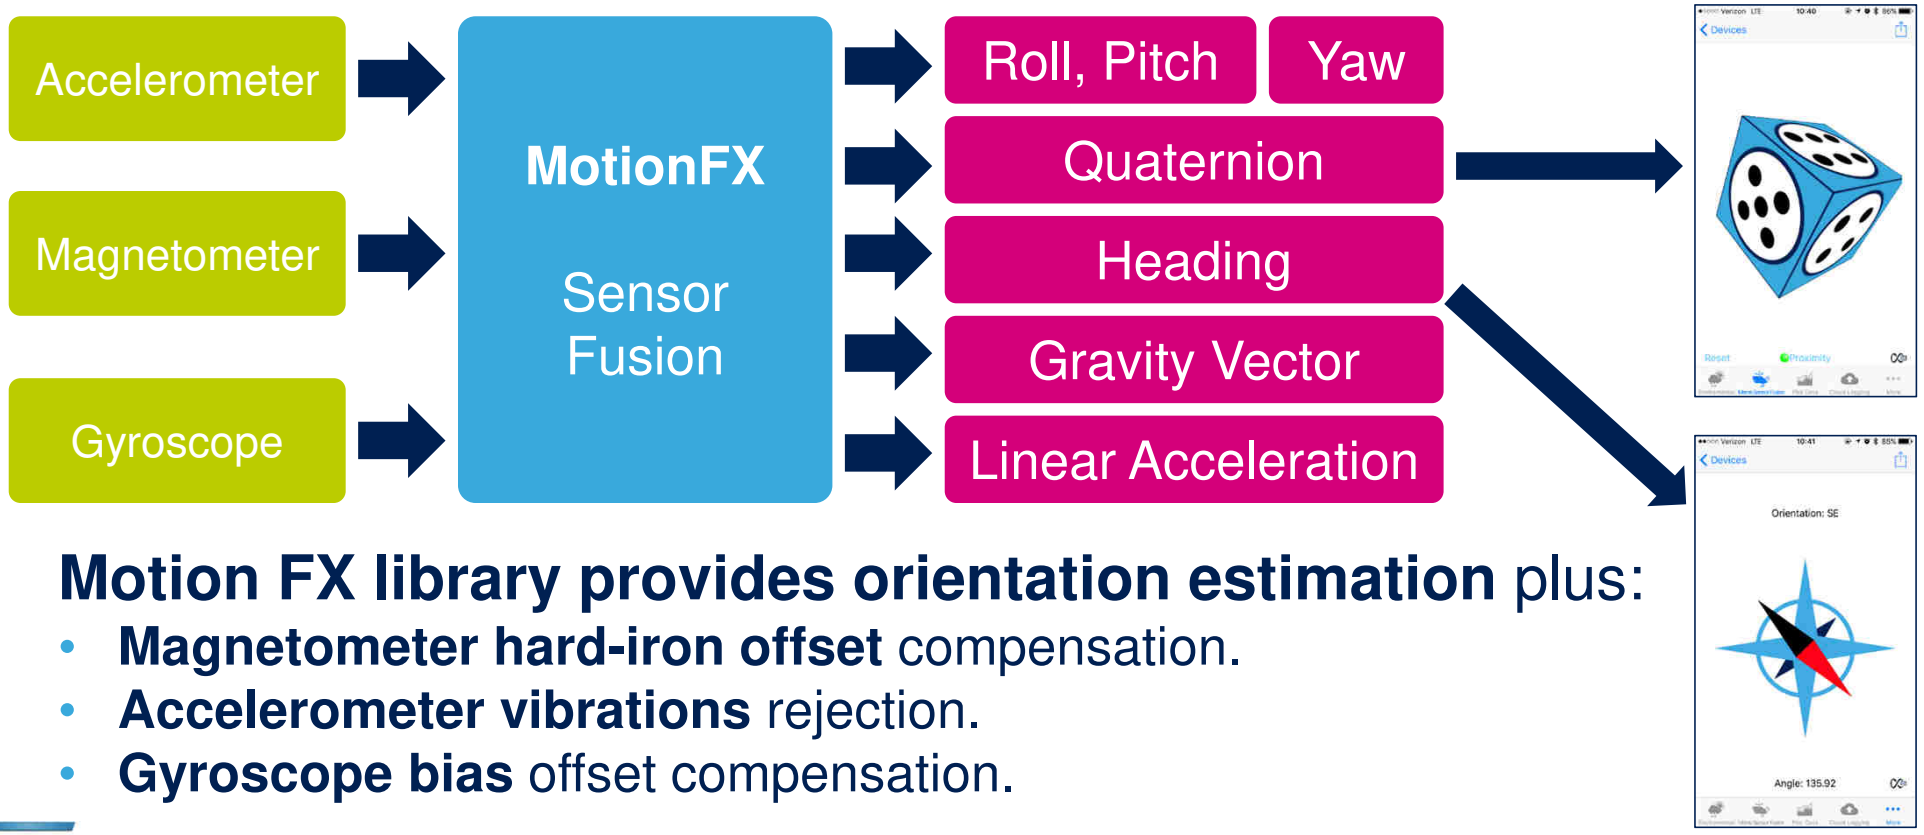


- **Gyroscope gives the new orientation** based on previous orientation

…but **gyro bias offset needs to be compensated** for accuracy!

Sensor Data Fusion

MotionFX Library



Motion FX library provides orientation estimation plus:

- **Magnetometer hard-iron offset** compensation.
- **Accelerometer vibrations** rejection.
- **Gyroscope bias** offset compensation.

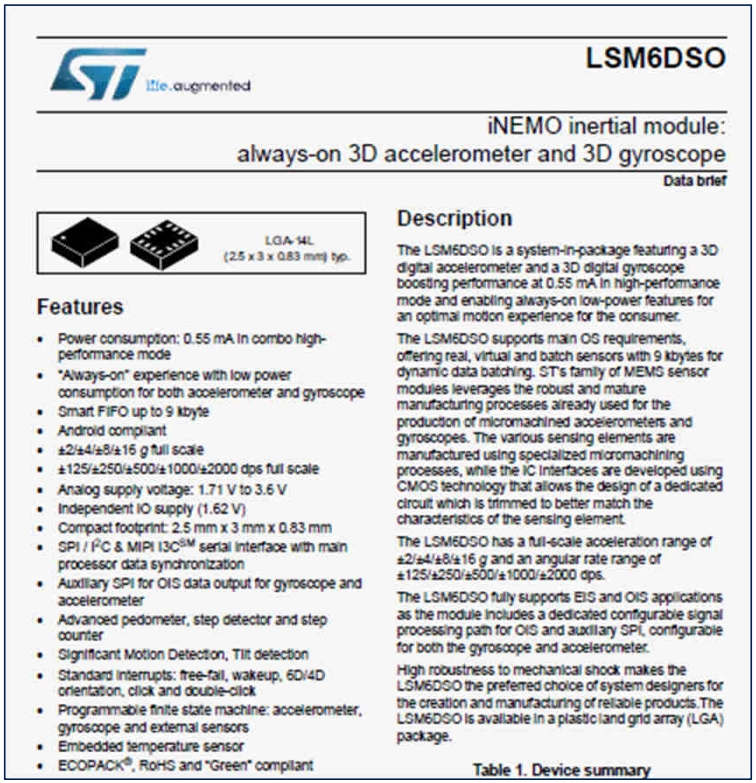
life.augmented

Gyroscope

The gyroscope is the most important sensor in the system
…works in highly dynamic conditions when the Acc cannot be used
…works with magnetic anomalies when the Mag cannot be used

LSM6DSO is an inertial module with **Acc** and **Gyro**

- **Exceptional noise performance** for maximum accuracy in orientation estimation
  - 90 ug/sqrtHz acc noise density
  - 3.8 mdps/sqrtHz gyro noise density
- **Extremely low-power**
  - **650 uA peak power** at ODR 6.66kS/sec with Acc+Gyro in high performance mode!



life.augmented

LSM6DSO

iNEMO inertial module:
always-on 3D accelerometer and 3D gyroscope

Data brief

LGA-14L
(2.5 x 3 x 0.83 mm) typ.

Features

- Power consumption: 0.55 mA in combo high-performance mode
- "Always-on" experience with low power consumption for both accelerometer and gyroscope
- Smart FIFO up to 9 kbyte
- Android compliant
- ±2/±4/±8/±16 *g* full scale
- ±125/±250/±500/±1000/±2000 dps full scale
- Analog supply voltage: 1.71 V to 3.6 V
- Independent IO supply (1.62 V)
- Compact footprint: 2.5 mm x 3 mm x 0.83 mm
- SPI / I²C & MIPI I3C℠ serial interface with main processor data synchronization
- Auxiliary SPI for OIS data output for gyroscope and accelerometer
- Advanced pedometer, step detector and step counter
- Significant Motion Detection, Tilt detection
- Standard interrupts: free-fall, wakeup, 6D/4D orientation, click and double-click
- Programmable finite state machine: accelerometer, gyroscope and external sensors
- Embedded temperature sensor
- ECOPACK®, RoHS and "Green" compliant

Description

The LSM6DSO is a system-in-package featuring a 3D digital accelerometer and a 3D digital gyroscope boosting performance at 0.55 mA in high-performance mode and enabling always-on low-power features for an optimal motion experience for the consumer.

The LSM6DSO supports main OS requirements, offering real, virtual and batch sensors with 9 kbytes for dynamic data batching. ST's family of MEMS sensor modules leverages the robust and mature manufacturing processes already used for the production of micromachined accelerometers and gyroscopes. The various sensing elements are manufactured using specialized micromachining processes, while the IC interfaces are developed using CMOS technology that allows the design of a dedicated circuit which is trimmed to better match the characteristics of the sensing element.

The LSM6DSO has a full-scale acceleration range of ±2/±4/±8/±16 *g* and an angular rate range of ±125/±250/±500/±1000/±2000 dps.

The LSM6DSO fully supports EIS and OIS applications as the module includes a dedicated configurable signal processing path for OIS and auxiliary SPI, configurable for both the gyroscope and accelerometer.

High robustness to mechanical shock makes the LSM6DSO the preferred choice of system designers for the creation and manufacturing of reliable products. The LSM6DSO is available in a plastic land grid array (LGA) package.

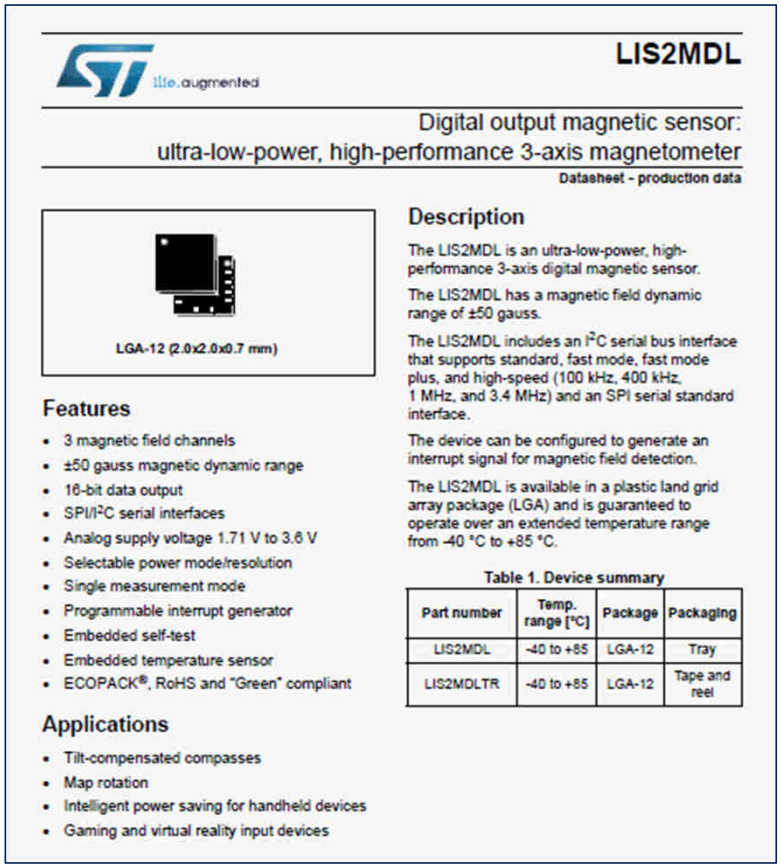
Table 1. Device summary

life.augmented

Magnetometer

LIS2MDL is **digital Mag**

- **Exceptional noise performance and dynamic range** for maximum accuracy in orientation estimation
  - 50 Gauss dynamic range
  - 3 mgauss RMS noise
- **Embedded offset compensation**
  - **Intrinsic offset is estimated and compensated automatically**
  - Extrinsic offset (hard-iron) must be estimated by host and can be compensated internally



life.augmented

LIS2MDL

Digital output magnetic sensor:
ultra-low-power, high-performance 3-axis magnetometer

Datasheet - production data

LGA-12 (2.0x2.0x0.7 mm)

Features

- 3 magnetic field channels
- ±50 gauss magnetic dynamic range
- 16-bit data output
- SPI/I²C serial interfaces
- Analog supply voltage 1.71 V to 3.6 V
- Selectable power mode/resolution
- Single measurement mode
- Programmable interrupt generator
- Embedded self-test
- Embedded temperature sensor
- ECOPACK®, RoHS and "Green" compliant

Applications

- Tilt-compensated compasses
- Map rotation
- Intelligent power saving for handheld devices
- Gaming and virtual reality input devices

Description

The LIS2MDL is an ultra-low-power, high-performance 3-axis digital magnetic sensor.

The LIS2MDL has a magnetic field dynamic range of ±50 gauss.

The LIS2MDL includes an I²C serial bus interface that supports standard, fast mode, fast mode plus, and high-speed (100 kHz, 400 kHz, 1 MHz, and 3.4 MHz) and an SPI serial standard interface.

The device can be configured to generate an interrupt signal for magnetic field detection.

The LIS2MDL is available in a plastic land grid array package (LGA) and is guaranteed to operate over an extended temperature range from -40 °C to +85 °C.

Table 1. Device summary

Part number	Temp. range [°C]	Package	Packaging
LIS2MDL	-40 to +85	LGA-12	Tray
LIS2MDLTR	-40 to +85	LGA-12	Tape and reel

Lab 7

Voice over BLE

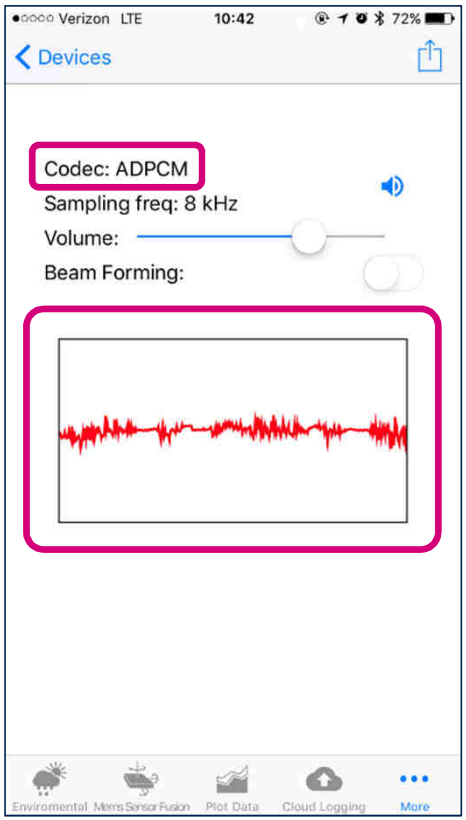
life.augmented

Goal

- In this example we are going to demonstrate how to:
  - **Enable the BlueVoice library** for Voice Over BLE streaming
    - Input: raw data from the MEMS microphone
    - Output: ADPCM data streaming @8kHz
  - **Send ADPCM data** through **BLE notifications packets** to the ST BLE Sensor app

life.augmented

BlueVoice Library



1. **Enable BlueVoice library**
2. **Send voice** to the ST BLE Sensor app client through **BLE notification packet**

Notification Packet

ADPCM compressed audio

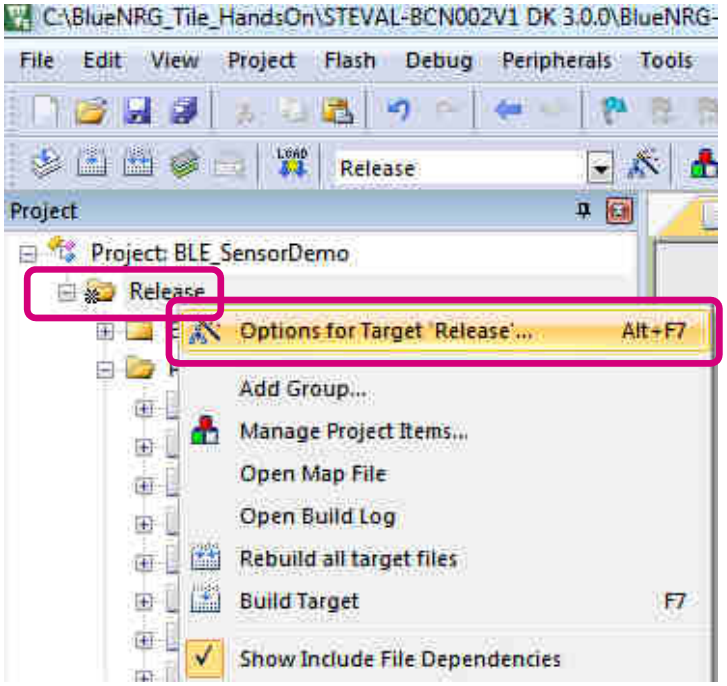
Enable BlueVoice Library

Add the preprocessor symbol **ENABLE_AUDIO** to the project

1. **Right-click** on **Release**
2. **Select** “**Options for Target ‘Release’…**”

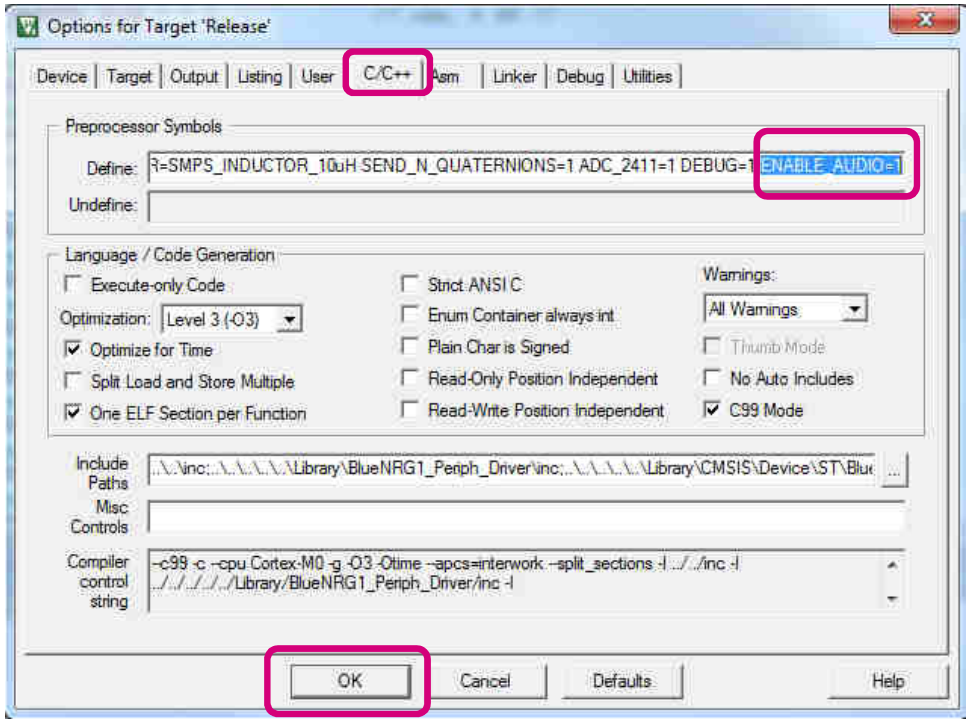


life.augmented

Enable BlueVoice Library

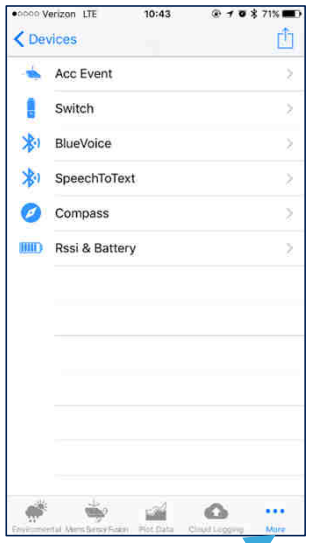
In the project options:

1. **Go to** the tab **C/C++** and then in the **Preprocessor Symbols**
2. **Set the symbol ENABLE_AUDIO=1** and then **click** on **OK**



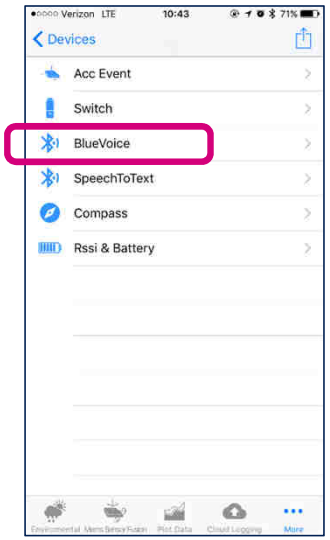
life.augmented

BlueVoice: Voice over Bluetooth LE

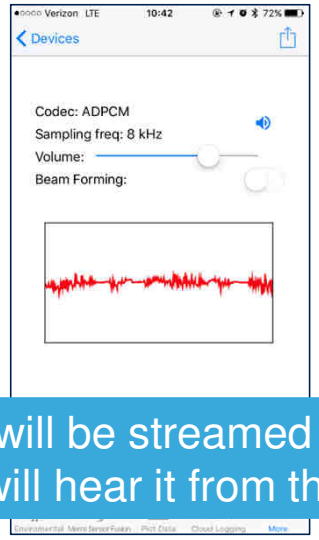


Tap

Select
"BlueVoice"

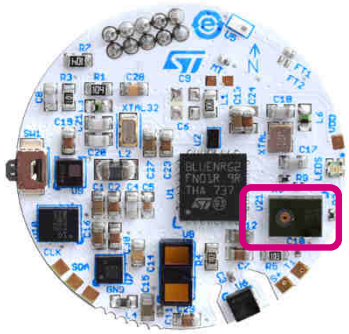


Speak close to the BlueNRG-Tile



Voice will be streamed over BLE
You will hear it from the phone

Do not silence your phone,
must **NOT** be vibration only!

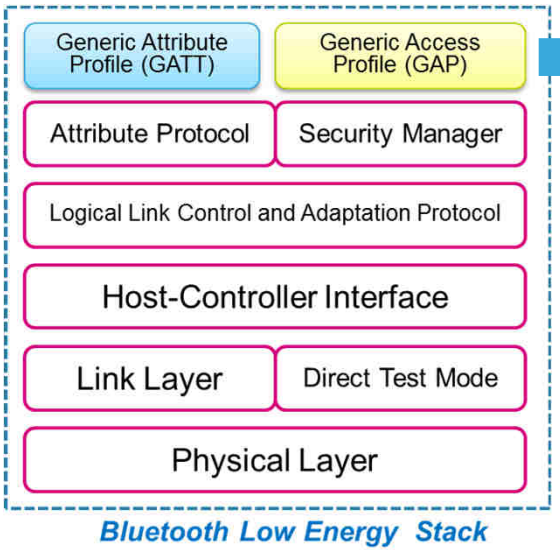


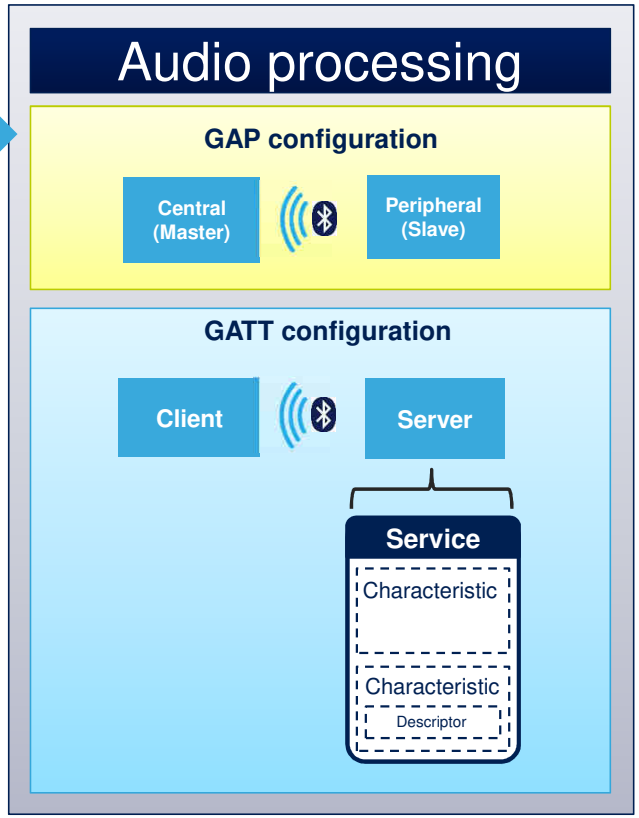
MEMS Microphone

(if the mic captures the audio from the phone speaker, a very high pitch sound can happen!)

life.augmented

Voice over Bluetooth LE





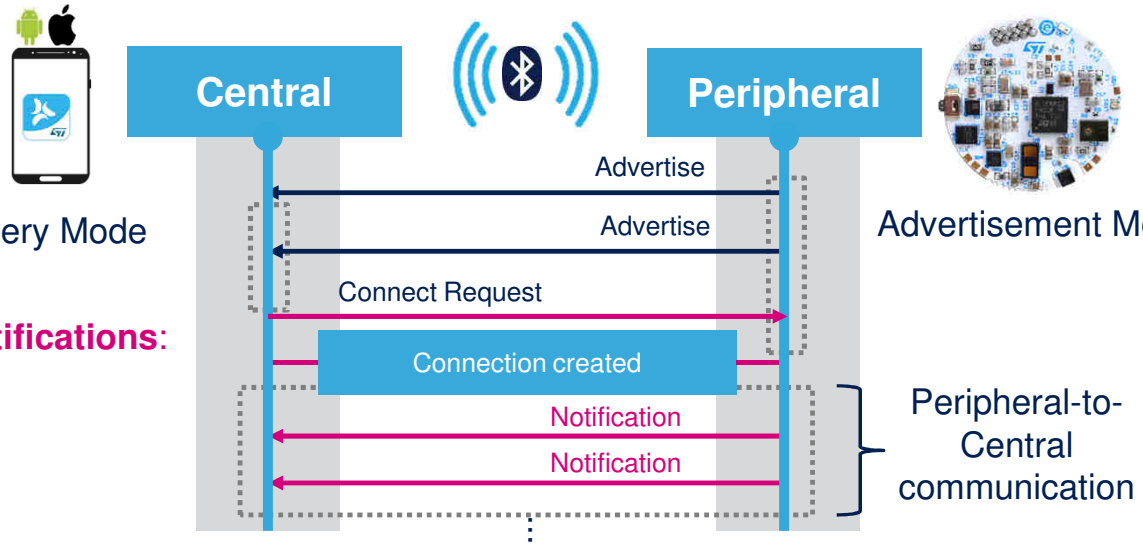
It's a Vendor Specific Service!

Audio: exported by the Server through **2 dedicated BLE characteristics**

Voice streaming over BLE:
Audio @8kHz
Codec: ADPCM
Bitrate: 32kbps

life.augmented

BlueVoice ADPCM - Audio 8kHz



No acknowledge required for **Notifications**:

- OK for Audio streaming
- **Minimal Latency**
- **Optimal Bandwidth**

Audio can be half-duplex

Voice Streaming

- Audio Format: **PCM 16 bit @ 8 kHz**
- **ADPCM Compression** @ 32 Kbps: Low latency and low complexity
- Side Information at low data rate enhances error resilience

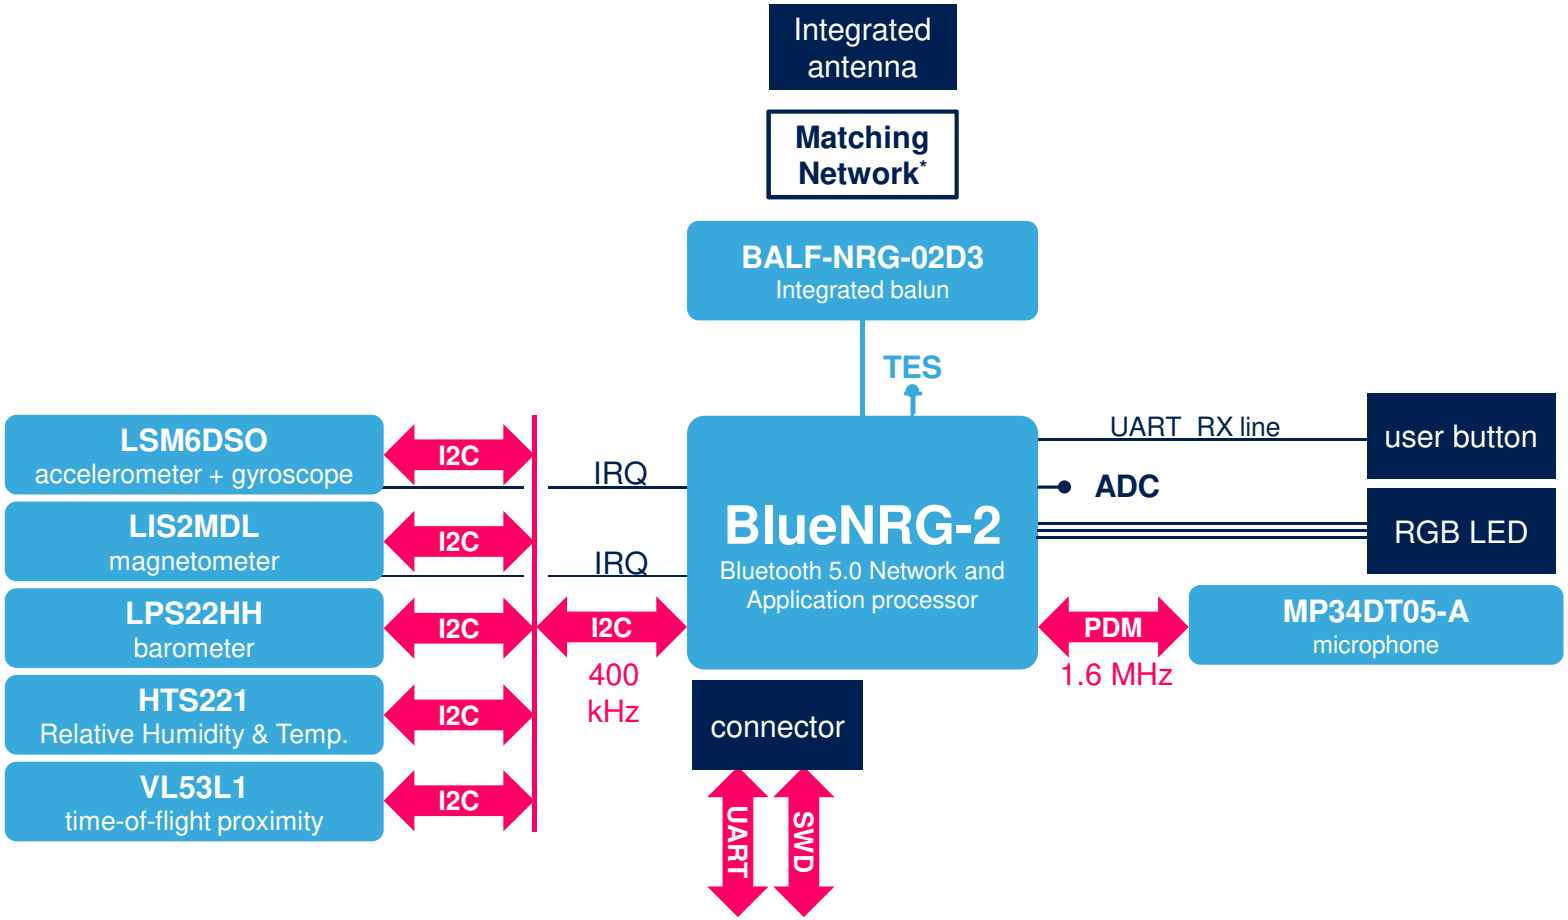
STEVAL-BCN002V1B Block Diagram



life.augmented

Enable/Disable Sensors & Libraries

- **Dedicated structure "FeaturePresence"** for enabling/disabling sensors & libraries individually. File **sensor.h**

```
typedef struct {
  bool AccelerometerGyroscopePresence;
  bool MagnetometerPresence;
  bool HumidityTemperaturePresence;
  bool PressurePresence;
  bool ProximityLightPresence;
  bool iNemoEngine;
  bool Pedometer;
} FeaturePresence;
```

- **SensorScan() function** set each field of the structure to **false** or **true**. File **sensor.c**

Disable the unneeded sensor for optimizing the power consumption!

```
// Check sensor list
SensorsScan();

// Configure discovered sensors
if (xFeaturePresence.PressurePresence)
  Init_Pressure_Temperature_Sensor();
if (xFeaturePresence.HumidityTemperaturePresence)
  Init_Humidity_Sensor();
if (xFeaturePresence.MagnetometerPresence)
  Init_Magnetometer();
if (xFeaturePresence.AccelerometerGyroscopePresence)
  Init_Accelerometer_Gyroscope();
if (xFeaturePresence.ProximityLightPresence)
  Init_Proximity_Sensor();

// Configure sensors in low power mode
SensorsLowPower();
```

BLE Timings

- **Advertising intervals**:
  - Dedicated API aci_gap_set_discoverable(Advertising_Type, Advertising_Interval_Min, Advertising_Interval_Max, …)
  - In file **sensor.c**
- **Connection intervals**:
  - Dictated by the Central device. Peripheral has no full control on this.
- **Notifications frequency**
  - Dedicated Virtual Timers (mapped on HW physical timers) for different functionalities
  - Timeouts defined in **sensor.h**

```
#define BATTERY_UPDATE_RATE     1000    // Fixed ODR @  1 Hz
#define ENV_SENSOR_UPDATE_RATE   100     // Fixed ODR @  10 Hz
#define MOTION_SENSOR_UPDATE_RATE   40    // Fixed ODR @ 25 Hz
```

HW Modifications

- In this case redesign is of course necessary
- **Schematics** and **Gerbers** files:
  - online at www.st.com/bluetile
- BlueNRG-2 **pin mapping**
  - Check **BlueNRG-2 DS** at **Table 129**

3.12.2 **Functional description**

The table below shows the GPIO configuration table where each IO pin is associated with related functions.

Table 129. IO functional map
