

INNOHOME STOVE ALARM SA101

Innohome Stove Alarm warns of a hazardous situation before a fire can start

The kitchen is the area at home most at risk of a fire, but the frequency of false alarms has meant that the installation of fire alarms is not being recommended. Safety in the kitchen can be increased using the Innohome Stove Alarm, that alerts the user to a hazardous situation happening on the cooker before it produces toxic gases or starts a fire. The Stove Alarm can also be used to support independent living when it may be risky to use the cooker due to advanced age, disability, memory disorder or learning difficulties.

The Stove Alarm is an affordable solution that improves the kitchen's fire safety significantly. Some UK fire services are currently having schemes of installing free Stove Alarms in risk groups' homes.

INNOHOME STOVE ALARM SA101

• Easy to use

Unique self-adjusting technology – simple and easy to use.

• Trustworthy

The Stove Alarm adjusts its sensitivity based on the users' cooking styles, allowing for improved alarm sensitivity and no interruptions to normal cooking.

• Proven technology

Research (eg. VTT and SINTEF) shows that the Stove Alarm alerts the user about a hazardous situation occurring on the cooker, before the formation of harmful gases and before a fire is ignited.

• Simple to install

The Stove Alarm is attached to the cooker hood using magnets, without the need for any tools. It does not have any cables or external power source.

Innohome Stove Alarm features

- Intelligent, self-adjusting Overheating Monitor. The Stove Alarm detects abnormal situations such as a fast change in the cooker top's temperature or a dangerously high temperature level
- Identifies overheating in the early phases of a hazardous situation
- The Stove Alarm intelligently learns the users' cooking styles and adjusts its sensitivity accordingly
- Manual and automatic alarm reset
- Compatible with all cooker types

More than half of accidental fires in homes result from cooking. *The latest National Statistics and detailed analysis on fires, casualties and false alarms conducted by the Fire and Rescue Services in the United Kingdom shows that more than half (51%) of accidental fires in homes are from cooking.*
