SIMPLIFICATION OF FORCE AND COUPLE SYSTEMS \& THEIR FURTHER SIMPLIFICATION

Today's Obiectives:
Students will be able to:
a) Determine the effect of moving a force.
b) Find an equivalent force-couple system for a system of forces and couples.

## In-Class Activities:

- Check Homework
- Reading Quiz
- Applications
- Equivalent Systems
- System Reduction
- Concept Quiz
- Group Problem Solving
- Attention Quiz

## MOVING A FORCE ON ITS LINE OF ACTION

Moving a force from A to B, when both points are on the vector's line of action, does not change the external effect.

Hence, a force vector is called a sliding vector. (But the internal effect of the force on the body does depend on where the force is applied).

## MOVING A FORCE OFF OF ITS LINE OF ACTION

When a force is moved, but not along its line of action, there is a change in its external effect!

Essentially, moving a force from point A to B (as shown above) requires creating an additional couple moment. So moving a force means you have to "add" a new couple.

Since this new couple moment is a "free" vector, it can be applied at any point on the body.

## SIMPLIFICATION OF A FORCE AND COUPLE SYSTEM

SIMPLIFICATION OF A FORCE AND COUPLE SYSTEM (continued)

If the force system lies in the $x-y$ plane (a 2-D case), then the reduced equivalent system can be obtained using the following three scalar equations.

$$
\begin{aligned}
F_{R_{x}} & =\Sigma F_{x} \\
F_{R_{y}} & =\Sigma F_{y} \\
M_{R_{O}} & =\Sigma M_{c}+\Sigma M_{O}
\end{aligned}
$$

## FURTHER SIMPLIFICATION OF A FORCE AND COUPLE SYSTEM (Section 4.8)

If $\boldsymbol{F}_{R}$ and $\boldsymbol{M}_{R O}$ are perpendicular to each other, then the system can be further reduced to a single force, $F_{R}$, by simply moving $\boldsymbol{F}_{R}$ from O to P .

In three special cases, concurrent, coplanar, and parallel systems of forces, the system can always be reduced to a single force.

## EXAMPLE I (continued)

$+\rightarrow \Sigma \mathrm{F}_{\mathrm{Rx}}=50(\sin 30)+100(3 / 5)$

$$
=85 \mathrm{lb}
$$

$+\uparrow \Sigma \mathrm{F}_{\mathrm{Ry}}=200+50(\cos 30)-100(4 / 5)$
$=163.3 \mathrm{lb}$
$+{ }_{( } M_{R A}=200(3)+50(\cos 30)(9)$

$-100(4 / 5) 6=509.7 \mathrm{lb} \cdot \mathrm{ft}$,

$$
\begin{gathered}
\mathrm{F}_{\mathrm{R}}=\left(85^{2}+163.3^{2}\right)^{1 / 2}=184 \mathrm{lb} \\
\angle \theta=\tan ^{-1}(163.3 / 85)=62.5^{\circ}
\end{gathered}
$$

The equivalent single force $\mathrm{F}_{\mathrm{R}}$ can be located at a distance d measured from A .
$\mathrm{d}=\mathrm{M}_{\mathrm{RA}} / \mathrm{F}_{\mathrm{Ry}}=509.7 / 163.3=3.12 \mathrm{ft}$

## EXAMPLE II

Plan:

1) Find $F_{R O}=\sum F_{i}=F_{R z o} \boldsymbol{k}$
2) Find $M_{R O}=\sum\left(r_{i} \times F_{i}\right)=M_{\mathrm{RxO}} \boldsymbol{i}+\mathrm{M}_{\mathrm{RyO}} \boldsymbol{j}$
3) The location of the single equivalent resultant force is given

$$
\text { as } \mathrm{x}=-\mathrm{M}_{\mathrm{RyO}} / \mathrm{F}_{\mathrm{RzO}} \text { and } \mathrm{y}=\mathrm{M}_{\mathrm{RxO}} / \mathrm{F}_{\mathrm{RzO}}
$$

## EXAMPLE II (continued)

$$
\begin{aligned}
\boldsymbol{F}_{R O} & =\{100 \boldsymbol{k}-500 \boldsymbol{k}-400 \boldsymbol{k}\}=-800 \boldsymbol{k N} \\
M_{R O} & =(3 \boldsymbol{i}) \times(100 \boldsymbol{k})+(4 \boldsymbol{i}+4 \boldsymbol{j}) \times(-500 \boldsymbol{k}) \\
& +(4 \boldsymbol{j}) \times(-400 \boldsymbol{k}) \\
& =\{-300 \boldsymbol{j}+2000 \boldsymbol{j}-2000 \boldsymbol{i}-1600 \boldsymbol{i}\} \\
& =\{-3600 \boldsymbol{i}+1700 \boldsymbol{j}\} \mathrm{N} \cdot \mathrm{~m}
\end{aligned}
$$

The location of the single equivalent resultant force is given as,

$$
\begin{aligned}
& \mathrm{x}=-\mathrm{M}_{\mathrm{Ryo}} / \mathrm{F}_{\mathrm{Rzo}}=(-1700) /(-800)=2.13 \mathrm{~m} \\
& \mathrm{y}=\mathrm{M}_{\mathrm{Rxo}} / \mathrm{F}_{\mathrm{Rzo}}=(-3600) /(-800)=4.5 \mathrm{~m}
\end{aligned}
$$

## READING QUIZ

1. A general system of forces and couple moments acting on a rigid body can be reduced to a $\qquad$ -.
A) single force
B) single moment
C) single force and two moments
D) single force and a single moment
2. The original force and couple system and an equivalent force-couple system have the same $\qquad$ effect on a body.
A) internal
B) external
C) internal and external
D) microscopic

## CONCEPT QUIZ

1. The forces on the pole can be reduced to a single force and a single moment at point $\qquad$ .
A) $P$
B) Q
C) $R$
D) S
E) Any of these points.

2. Consider two couples acting on a body. The simplest possible equivalent system at any arbitrary point on the body will have
A) One force and one couple moment.
B) One force.
C) One couple moment.
D) Two couple moments.

## ATTENTION QUIZ

1. For this force system, the equivalent system at P is
A) $\mathrm{F}_{\mathrm{RP}}=40 \mathrm{lb}$ (along +x -dir.) and $\mathrm{M}_{\mathrm{RP}}=+60 \mathrm{ft} \cdot \mathrm{lb}$
B) $\mathrm{F}_{\mathrm{RP}}=0 \mathrm{lb}$ and $\mathrm{M}_{\mathrm{RP}}=+30 \mathrm{ft} \cdot \mathrm{lb}$
C) $\mathrm{F}_{\mathrm{RP}}=30 \mathrm{lb}$ (along +y -dir.) and $\mathrm{M}_{\mathrm{RP}}=-30 \mathrm{ft} \cdot \mathrm{lb}$
D) $\mathrm{F}_{\mathrm{RP}}=40 \mathrm{lb}$ (along +x -dir.) and $\mathrm{M}_{\mathrm{RP}}=+30 \mathrm{ft} \cdot \mathrm{lb}$

## GROUP PROBLEM SOLVING I

Given: A 2-D force and couple system as shown.

Find: The equivalent resultant force and couple moment acting at A.

Plan:

1) Sum all the $x$ and $y$ components of the two forces to find $F_{R A}$.
2) Find and sum all the moments resulting from moving each force to A and add them to the $1500 \mathrm{~N} \cdot \mathrm{~m}$ free moment to find the resultant $\mathrm{M}_{\mathrm{RA}}$.

## GROUP PROBLEM SOLVING I (continued)

Summing the force components:

$$
\begin{aligned}
+\rightarrow \Sigma \mathrm{F}_{\mathrm{x}} & =450(\cos 60)-700(\sin 30) \\
& =-125 \mathrm{~N}
\end{aligned}
$$

$$
\uparrow \Sigma F_{y}=-450(\sin 60)-300-700(\cos 30)
$$

$$
=-1296 \mathrm{~N}
$$

Now find the magnitude and direction of the resultant.

$$
\begin{aligned}
\mathrm{F}_{\mathrm{RA}}=\left(125^{2}+1296^{2}\right)^{1 / 2}=1302 \mathrm{~N} \text { and } \begin{aligned}
\theta & =\tan ^{-1}(1296 / 125) \\
& =84.5^{\circ}
\end{aligned}
\end{aligned}
$$

$$
\begin{aligned}
+\left(\mathrm{M}_{\mathrm{RA}}\right. & =450(\sin 60)(2)+300(6)+700(\cos 30)(9)+1500 \\
& =9535 \mathrm{~N} \cdot \mathrm{~m}^{\uparrow}
\end{aligned}
$$

## GROUP PROBLEM SOLVING II

Given: Forces $\boldsymbol{F}_{1}$ and $\boldsymbol{F}_{2}$ are applied to the pipe.

Find: An equivalent resultant force and couple moment at point O .

## Plan:

a) Find $\boldsymbol{F}_{R O}=\Sigma \boldsymbol{F}_{\boldsymbol{i}}=\boldsymbol{F}_{1}+\boldsymbol{F}_{2}$
b) Find $M_{R O}=\Sigma M_{C}+\Sigma\left(r_{i} \times F_{i}\right)$
where,
$\boldsymbol{M}_{C}$ are any free couple moments (none in this example).
$\boldsymbol{r}_{\boldsymbol{i}}$ are the position vectors from the point O to any point on the line of action of $\boldsymbol{F}_{i}$.

## GROUP PROBLEM SOLVING II (continued)

$$
\begin{aligned}
& \boldsymbol{F}_{1}=\{-20 \boldsymbol{i}-10 \boldsymbol{j}+25 \boldsymbol{k}\} \mathrm{lb} \\
& \boldsymbol{F}_{2}=\{-10 \boldsymbol{i}+25 \boldsymbol{j}+20 \boldsymbol{k}\} \mathrm{lb} \\
& \boldsymbol{F}_{\boldsymbol{R O}}=\{-30 \boldsymbol{i}+15 \boldsymbol{j}+45 \boldsymbol{k}\} \mathrm{lb} \\
& \boldsymbol{r}_{1}=\{1.5 \boldsymbol{i}+2 \boldsymbol{j}\} \mathrm{ft} \\
& \boldsymbol{r}_{2}=\{1.5 \boldsymbol{i}+4 \boldsymbol{j}+2 \boldsymbol{k}\} \mathrm{ft}
\end{aligned}
$$

Then, $M_{R O}=\Sigma\left(r_{i} \times F_{i}\right)=r_{1} \times F_{1}+r_{2} \times F_{2}$
$M_{\text {RO }}=\left\{\left|\begin{array}{ccc}\boldsymbol{i} & \boldsymbol{j} & \boldsymbol{k} \\ 1.5 & 2 & 0 \\ -20 & -10 & 25\end{array}\right|+\left|\begin{array}{ccc}\boldsymbol{i} & \boldsymbol{j} & \boldsymbol{k} \\ 1.5 & 4 & 2 \\ -10 & 25 & 20\end{array}\right|\right\} \mathrm{lb} \cdot \mathrm{ft}$
$=\{(50 \boldsymbol{i}-37.5 \boldsymbol{j}+25 \boldsymbol{k})+(30 \boldsymbol{i}-50 \boldsymbol{j}+77.5 \boldsymbol{k})\} \mathrm{lb} \cdot \mathrm{ft}$
$=\{80 \boldsymbol{i}-87.5 \boldsymbol{j}+102.5 \boldsymbol{k}\} \mathrm{lb} \cdot \mathrm{ft}$
