

Advanced Cell Culture Solutions for Your Seahorse XF Analyzer

Agilent sensor cartridges and cell culture microplates

Gain a Clearer Picture of What Your Cells Are Doing

Comprising instruments, assay kits, software, and consumables, Agilent Seahorse XF platforms are designed to support you from sample to insight.

Sensor cartridges for reliable kinetic measurements

Cellular oxygen consumption (respiration) and proton excretion (glycolysis) cause rapid changes to the concentrations of dissolved oxygen and free protons. Agilent sensor cartridges for Seahorse XF Analyzers ensure sensitive, kinetic measurements to simultaneously analyze both metabolic energy pathways.

Key features

- Patented transient microchamber improves analytical sensitivity and signal-to-noise of OCR and ECAR (PER and gPER) readings.
- Solid-state sensor probes containing polymer-embedded fluorophores detect oxygen and proton levels in cell culture media. The probes reside 200µm* above the cells and take measurements every few seconds.
- Integrated injection ports—a patented design—let you add compounds, stimulators, inhibitors, substrates, and beads conjugated with antigens.
- Sensors are spotted onto the cartridge using both manual and machine vision inspection.
- Every lot is 100% quality controlled for performance and lot-to-lot consistency.

* Microchamber volume differs by tissue culture plate type.

Agilent Seahorse XF FluxPaks Take You from Sample to Insight

Convenient FluxPaks contain the essential consumables you need to perform XF assays.

Sensor cartridges

The essential component for simultaneously measuring bioenergetic pathways.

- Non-invasive sensors to measure dissolved oxygen and free protons
- Four injection ports
- Lot-to-lot consistency
- High-precision manufacturing process
- One-year shelf life from manufacturing date
- Patented design

Cell culture microplates

Choose from many plates to suit your application and sample type. See page 8 for a complete list.

- Tissue culture treated and irradiated for sterility
- Tapered walls to facilitate cartridge alignment, especially at low volumes
- Well "bumps" define microchamber height and volume
- Conforms to ANSI/SLAS Microplate Standards for footprint dimensions and well positions
- Polystyrene material
- Living cells, isolated mitochondria, islets, and spheroids
- Poly-D-Lysine 96- and 8-well formats

Calibrant and calibration plates

- Premixed calibrant: ready to use and optimized for XF sensor cartridge calibration
- Calibration plates: suitable for calibration and hydration

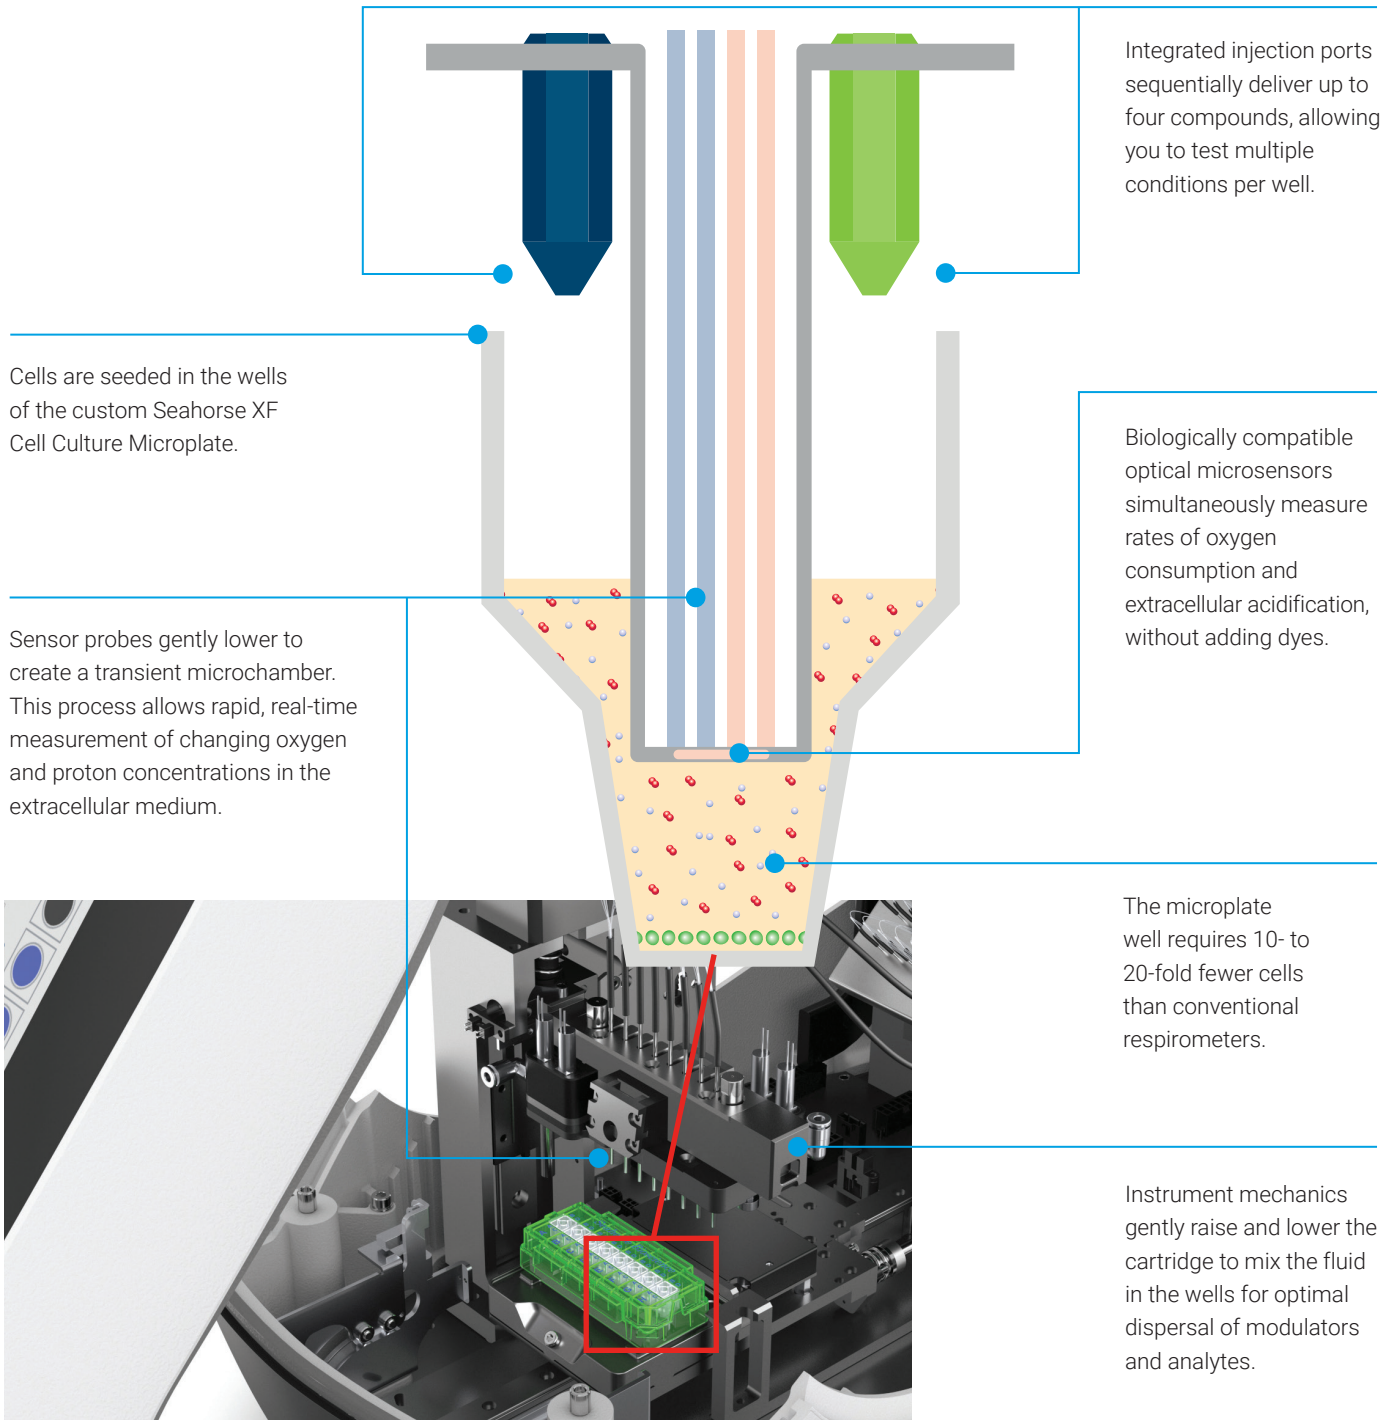

Precise sensor cartridge spotting

High-resolution machine vision imaging inspects the spot quality on every cartridge.

Seahorse XF Technology: A Closer Look

The integrated drug delivery system lets you sequentially add up to four compounds per well, so you can perform a complete mitochondrial or glycolytic kinetic assessment.

What happens during a measurement cycle?

Each measurement cycle amounts to one time point; over time, the kinetic data is plotted and displayed.

Mix

When the assay starts, the sensor cartridge probes lower into each well and repeatedly mix the culture medium.

Measure

The probes lower to form the extremely small volume of the transient microchamber.

Inject

After a series of basal measurements, constituents are injected from the drug ports into the culture medium at user-programmable intervals.

Cell Culture Microplate Types and Specifications

XF HS Miniplate

Seahorse XF Cell Culture Microplates and Miniplates can be modified with substrates to improve cellular adherence. You can purchase precoated Poly-D-Lysine plates or modify manually (such as collagen or Cell-Tak).
