TABLE OF CONTENTS

INTRODUCTION

1.1 Projector Overview

Wolf Cinema DCX-i and DCX-FD units are all professional 3-chip projectors based on next-generation Digital Light Processing™ (DLP™) technology by Texas Instruments™ to deliver high quality, crisp, clean images.

Wolf Cinema projectors provide a powerful combination of HD resolution, high brightness and high contrast ratios to produce flawless, cinematic high definition, as well as realistic three-dimensional images for virtual reality and gaming.
Main Features

- Native SXGA+, HD or HD2 resolution (model dependant) with all others fully scaleable
- Internal scaling of stereo signals (XXXX models)
- 10-bit video processing
- Built-in multi-standard video decoder
- Display of NTSC, PAL and SECAM video input
- User replaceable Cermax® Xenon lamp
- Lamp Tracking Calibration for constant brightness
- Lens VariScope System (LVS™) to save and restore lens settings
- Motorized lens mount for all models
- Quick Setup feature
- Networking ability through RS232 and RS422 connectors
- Status LED display on built-in keypad for easy projector status monitoring
- Control with IR, wired or built-in keypad
- Two input slots for Optional Input Modules

Refer to *Section 6* for a complete list of Specifications including Brightness and Contrast and Optional Input Modules

1.2 Components

The following listed items are shipped with your projector. Ensure you have received all these items before using your projector.

- User's Manual
- IR remote keypad (includes two, 1.5V AA batteries and a mini-stereo cable for conversion to wired)
- Power cord
- Stereo 3D Cable (XXXX only)
- Warranty Card

Lamp Type	Model Name	Resolution	Wolf WARP	3D	Motorized Lens Mount
500W Models	DCX-500i	HD 1080p	Optional	●	✓
	DCX-500FD	HD 1080p	Optional	●	✓
1000W Models	DCX-1000i	HD 1080p	Optional	●	✓
	DCX-1000FD	HD 1080p	Optional	●	✓
1200W Models	DCX-1500i	HD 1080p	Optional	●	✓
	DCX-1500FD	HD 1080p	Optional	●	✓

1.3 Warranty

Please see included Warranty.

INSTALLATION & SETUP

2.1 Quick Setup

The instructions provided here are for those that are familiar with the projector and wish to quickly set it up and use it temporarily. Refer to the remaining subsections of this manual for a more complete setup.

Step 1

INSTALL THE PROJECTION LENS
The projection lens is shipped separately from the projector and must be installed prior to setting up the projector. Install the projection lens as described in *4.5 Replacing the Projection Lens.*

⚠ **Remove the red lens plug** from the lens opening in the projector before installing the lens.

⚠ **Remove the lens when shipping** the projector and **reuse the lens plug** to prevent dust and debris from entering and settling on critical optical components.

Step 2

POSITION THE PROJECTOR
Place the projector on a sturdy, level surface and position it so that it is perpendicular to the screen at a suitable distance. In general, the further back the projector is positioned from the screen, the larger the image will be.

If required, you can level the projector by adjusting its three feet. With the projector positioned perpendicular to the screen the image will appear rectangular instead of keystoned.

For more detailed instructions on positioning the projector refer to *Projector Position and Mounting* later in this section.

Step 3

CONNECT A SOURCE
Located at the back of the projector is the input panel where all source connections are made. Each input is clearly labeled for easy identification.

Using the appropriate cable(s), connect your source. Connect RGB and YPbPr sources to **INPUT 1** located in the upper right corner of the input panel. Use the DVI-I connector at **INPUT 2** to connect analog or digital display signals. Connect composite video to **INPUT 3** and S-Video to **INPUT 4**.

NOTE: *One of the available optional input modules can be installed at* **INPUT 5** *or* **INPUT 6** *for additional connections.*

Refer to *2.3 Connecting Sources* for more details on connecting a specific source.

Step 4 | **CONNECT THE POWER CORD**

⚠️ **The North American-rated power cord is provided with each projector. Ensure that you are using a power cord, socket and power plug that meets the appropriate local rating standards.**

Plug the power cord to the AC receptacle located on the right hand side of the projector and the 3-pronged end into a grounded AC outlet. The input voltage to the projector must be capable of 100-240VAC (DCX-500 and DCX-1000 models) and 200-240VAC (DCX-1500 models). *(See also **Section 6 – Specifications** for complete details on all power requirements.)*

Use the approved North American-rated power cord supplied with the projector. If you are connecting to an area outside of North America make sure you are using an appropriately rated power cord.

Step 5 | **TURN THE PROJECTOR ON**

Press the ⏻ POWER button on either the remote or built-in keypad to turn the projector on. Wait a few minutes to allow the projector to warm up. The LED status window displays an active pattern of segments to indicate the projector is changing its state from powered down to powered up. The message "On" appears in the display when the projector has completed its initialization and is ready for use.

Step 6 | **SELECT A SOURCE**

Press one of the input keys on the remote or built-in keypad to select and display the image for the source you connected in Step 3.

Step 7 | **ADJUST IMAGE**

Adjust the more common Picture Adjustments, such as Brightness, Contrast, Gamma, Focus, Zoom etc. using the direct keys on the IR remote.

You can also access the menu system and adjust these and other Picture Adjustments by pressing (Menu) on the remote.

2.2 Installation Considerations

Proper installation of your projector will ensure the quality of your display. Whether you are installing a projector temporarily or permanently you should take the following into account to ensure your projector performs optimally.

Installation Type

Choose the installation type that best suits your needs: front or rear screen, floor mount or inverted mount.

Screen Type

FRONT SCREEN INSTALLATIONS
In front screen installations the projector and audience are positioned in front of the screen, which can be flat or curved.

Flat screens are recommended with this projector. They offer a gain of about 1 with a viewing angle just less than 180°. This type of screen reflects incident light equally in all directions so the audience can see the display from various angles.

Curved screens have a gain greater than 1 with a viewing angle much less than 180°. This type of screen does not reflect incident light equally in all directions instead it is concentrated in a viewing cone. The audience sitting within the viewing cone area will see a brighter image than those sitting just outside this area.
REAR SCREEN INSTALLATIONS
There are two basic types of rear screens: diffused and optical.

A diffused screen has a surface, which spreads the light striking it. Purely diffused screens have a gain of less than one. The main advantage of the diffused screen is its wide viewing angle, similar to that of a flat screen for front screen projection. This type of screen is suitable when a wide viewing angle is required but there is low ambient room lighting.

Optical screens take light from the projector and redirect it to increase the light intensity at the front of the screen. This reduces it in other areas. A viewing cone, similar to that of a curved front screen installation is created. This type of screen is better suited for brightly lit rooms where the audience is situated within the viewing cone.

SCREEN SIZE
Choose a screen size, which is appropriate for your lens and application. The size of the room and viewing distance are the defining factors; a rule of thumb is that the primary viewing distance be 1.5 x screen width.

To fill a screen with an image, the aspect ratio of the screen should be equal to the aspect ratio of the image (expressed as the ratio of its width to its height). Standard video from a VCR has a 4:3 or 1.33:1 aspect ratio. For example, to display a VCR output with a 4:3 aspect ratio onto a 10-foot (3m) high screen, the width of the screen must be at least 13.3 feet (4m).

Ambient Light

The high brightness of this projector is well suited for locations where ambient lighting might be considered less than ideal for projection. A typical room with ceiling lights and windows rarely requires special attention. Contrast ratio in your images will be noticeably reduced if light directly strikes the screen, such as when a shaft of light from a window or floodlight falls on the image. Images may then appear washed out and less vibrant.

In general, avoid or eliminate light sources directed at the screen.

Other Considerations

Other considerations and tips that can help improve your installation:

• Keep the ambient temperature constant and below 35°C (95°F). Keep the projector away from heating and/or air conditioning vents. Changes in temperature may cause drifts in the projector circuitry, which may affect performance.

• Keep the projector away from devices that radiate electromagnetic energy such as motors and transformers. Common sources of these include slide projectors, speakers, power amplifiers, elevators, etc.

Choose the best screen size for the application. Since more magnification reduces brightness, use a screen size appropriate for the venue but not larger than required. Installing a large screen in a small room is similar to watching television at a close range; too large a screen can overpower a room and interfere with the overall effect. A good rule of thumb is to be no closer than 1.5 times the width of the screen or a 23° viewing angle.

Projector Position and Mounting

THROW DISTANCE

Throw distance is the distance measured from your projector's lens to the screen. This is an important calculation in any projector installation as it determines whether or not you have enough room to install your projector with a desired screen size and if your image will be of the right size for your screen.

You can quickly estimate the throw distance by taking the horizontal width of the screen and multiplying it by the lens throw ratio. The result of this calculation tells you "roughly" how far back the projector should be positioned from the screen in order to project a focused image large enough to fill the screen. For example, using a 0.75:1 lens, throw distance would roughly be 0.75 x screen width.

IMPORTANT: Once you determine the type of lens and screen size you're going to use, calculate the precise throw distance using the formula located in Appendix C. Due to lens manufacturing tolerances for lens focal length, actual throw distance can vary ±5% between lenses described as having the same throw ratio.

Throw Distance (TD) = Screen Width (w) X Lens Throw Ratio
Measured from the front of projector's front feet.

VERTICAL AND HORIZONTAL POSITION
The correct vertical and horizontal position of the projector in relation to the screen depends on the lens type and the screen size. Ideally, the projector should be positioned perpendicular to the screen. This way, the image will appear rectangular instead of keystoned (trapezoidal).

The **vertical position** of the image can be offset – that is moved above or below the optical axis (lens center) by adjusting the fully motorized lens mount with the keypad. The amount of vertical offset available depends directly on the lens installed in the projector and can be slightly limited if horizontal offset has been applied. Vertical offset can also be expressed as the percent of half the image height OR the number of pixels of shift from lens center. Refer to Figure 2.1 for some illustrated examples of vertical offset.

Table 2.1 along with Figure 2.2 show the maximum vertical offset of a lens or alternatively, how much of your projected image will appear above or below lens center if the maximum vertical offset is applied using that lens.

Table 2.1 Lens Offsets

Lens Type (All motorized lenses)	Offset Movement		Max. Amount of Display Above or Below Lens Center		Max. Amount of Display Right or Left of Lens Center	
	↑ or ↓	← or →				
HD Lenses	119%	42%	1183 pixels ↑ or ↓	100%	1363 pixels ← or →	71%

NOTES: 1) *Offsets are subject to ±7% centering tolerance* **2)** *% Offset = # pixels of offset / half panel resolution x 100.*

Examples of Vertical Offset (SXGA+ pixels represented)

Where:
***Shaded area** = projected image*
***Area within solid line** = projected image area with no offset applied*

525 pixels above lens center

0% Offset

Lens center

525 pixels below lens center

#1 In this example, no offset is applied. Half of the image appears above lens center and half of the image appears below

1050 pixels of display above lens center OR 525 pixels of shift above lens center

100% Offset

Lens center

#2 In this example, 100% offset is applied, therefore all of the image appears above lens center.

919 pixels of display above lens center OR 394 pixels of shift above lens center

75% Offset

Lens center

131 pixels of display below lens center

#3 In this example, 75% offset is applied, therefore 7/8 (or 88%) of the projected image appears above lens center.
*75% Offset = 394 / 525 *100*

*Figure 2.1 Vertical Offset Examples*

Vertical Offset for Fixed Lenses

Where:
Ⓐ = Lens center (optical axis)
Ⓑ = Projected image vertical center
Ⓒ = Vertical offset (maximum)
Ⓓ = Projected image area with full offset applied (shaded area)
Ⓔ = Projected image area with no offset applied (area within solid lines)

**Vertical Offset for Zoom Lenses**

Figure 2.2 Lens Vertical Offsets

The **horizontal position** of the image can be offset – that is moved to the left or right of lens center, by adjusting the fully motorized lens mount through software. The amount of horizontal offset available depends on the lens installed and if the image has already been vertically offset. Horizontal offset can also be expressed as the percent of half the image width – the number of pixels of shift to one side of lens center. Refer to Figure 2.3 for some illustrated examples of horizontal offset.

See also Table 2.1 along with Figure 2.4 which shows the maximum horizontal offset of a lens or alternatively, how much of your projected image will appear to one side of lens center if the maximum horizontal offset is applied using that lens.

Examples of Horizontal Offset

Where:
Shaded area *= projected image*
Area within solid line *= projected image area with no offset applied*

700 pixels display to left of lens center

700 pixels display to right of lens center

350 pixels to leftt of lens center

1050 pixels displayed to right of lens center or 350 pixels of shift to right of lens center

Lens center

0% Offset

Lens center
50% Offset

#1 *In this example, no offset is applied. Therefore half of the image appears to the left or lens center and half appears to the right.*

#2 *In this example, 50% offset is applied, therefore ¾ or 75% of the image appears to one side of lens center.*

Figure 2.3 Horizontal Offset Examples

Horizontal Offset for Fixed Lenses
Horizontal Offset for Zoom Lenses
Figure 2.4 Lens Horizontal Offset Examples

MOUNTING

There are several methods for mounting the projector. Depending on your chosen installation, one method may be more suitable than another. In typical front and rear screen installations the projector can be mounted to a secure and level surface, such as a table.

CEILING MOUNT — The projector can also be inverted and suspended from the ceiling using a specially designed ceiling mount fixture. This type of mounting is recommended for fixed installations and for those that want the projector out of sight or have a limited space for projector and audience.

⚠️ **Use only the WOLF CINEMA approved ceiling mount kit designed for your projector. Refer to the installation instructions and safety guidelines provided in the kit.**

SPECIAL MOUNTING — The projector can be rotated (front-to-back) up to 360 degrees and mounted without it affecting performance. However, the side-to-side tilt limit of the projector must not exceed ±15 degrees. This tilt limit is required to ensure optimal performance of the lamp. (Figure 2.5.)

ADJUSTING PROJECTOR HEIGHT

You can modify the height of the projector to remedy a slightly unlevel mounting surface by adjusting the two feet threaded into the front bottom chassis. Turn each foot clock-wise or counterclockwise until the project is level on all sides.

FOLDED OPTICS

In rear screen applications where space behind the projector is limited, a mirror may be used to fold the optical path. The position of the projector and mirror must be accurately set — if considering this type of installation call your dealer for assistance.

Figure 2.5 Folded Optical Path

2.3 Connecting Sources

Sources connect to the *Input Panel* located at the back of the projector. See Figure 2.6.

The upper right corner *(INPUT 1)* typically accepts an RGB signal from an external analog RGB source, or it can also be used for YPbPr signals or additional video sources. Just beside these BNCs, the DVI-I connector *(INPUT 2)* accepts digital or analog display signals from a computer. Connect analog composite video at *INPUT 3* or *S-Video* at *INPUT 4* from devices such as VCRs, laser disc players or DVD players.

There are also several optional interfaces available for connecting other sources — these interfaces slide into the remaining unused option slot, and can be done while the projector is running.
Figure 2.6 Input Panel

NOTES: 1) *See **Section 6, Specifications** for details regarding compatible inputs.* **2)** *Use high quality shielded cables only for all connections.*

RGB Signals

INPUT 1 consists of five BNCs (connectors) for linking to a variety of sources. The typical connection would be to an RGB source such as a PC, Mac. This projector supports multiple sync types with RGB signals: sync-on-green, composite sync, and separate H & V syncs.

NOTE: *Depending on your source, you may need a custom adapter cable with BNC connectors at the projector end and a different type of connector at the other (such as a 15-pin "D" connector for some computer sources). Contact your dealer for details.*

Connect the **SYNC** BNC input(s) first. Then connect the red, green and blue source outputs to the **RED***,* **GREEN***,* and **BLUE** BNCs on the **INPUT 1** panel. If the source uses sync-on-green, only the red, green, and blue connections are required. If the source provides a composite sync output, connect it to the **SYNC** input labeled **HOR/COMP**. If the source provides separate horizontal and vertical sync outputs, connect horizontal sync to the **SYNC** input labeled **HOR/COMP** and connect vertical sync to **SYNC** input labeled **VERT.** See Figure 2.7.
Figure 2.7 Connecting RGB and Sync

NOTES: 1) *If for some reason the projector fails to recognize a signal as an RGB signal, specify this Color Space option within the Picture Adjustments menu. See 3.5 Adjusting the Image.* **2)** *To connect YPbPr signals–such as from DVDs or analog HDTV sources–to INPUT 1, use the red, green and blue BNCs as described in YPbPr Signals (below).*

**YPbPr signals
(COMPONENT VIDEO)**

Connect a YPbPr signal (component video) to **INPUT 1** or **INPUT 2** as shown in Figure 2.8.

NOTES: 1) *If, for some reason, the projector fails to recognize a YPbPr signal, specify this Color Space option within the Picture Adjustments menu. See 3.5, Adjusting the Image.* **2)** *Do not connect digital component signals (known as YCbCr) to INPUT 1. Install an appropriate optional module in INPUT 5 or INPUT 6 for this.*
Figure 2.8 Connecting YPbPr sources

Composite and S-Video

INPUT 3 and **INPUT 4** provide simultaneous connection of both a composite video source (**INPUT 3**) and an S-Video source (**INPUT 4**). See Figure 2.9.
Figure 2.9 Connecting Composite or S-Video sources

DVI Digital Video

Use the DVI-I connector at **INPUT 2** to connect either analog or digital video devices to the projector. When connecting devices that transmit an analog video signal such as VCRs, laptops, and PCs use the DVI cable provided with the projector. Plug the   DVI-I (single link) connector end to the projector and the 15-pin VGA connector to the device.

Use a cable with DVI-I connectors at both ends to connect devices that transmit digital and analog video signals such as high-quality DVD players, satellite receiver and digital cable TVs.

NOTES: 1) *To ensure true digital output from devices that transmit digital signals, connect to the DVI-I connector.* **2)** *DVI loop through is not available unless you have the optional DVI Input Module installed at INPUT 5 or INPUT 6.*

Optional Inputs

Optional modules allow you to increase your total number of inputs and/or accommodate different signal types, whether analog or digital. Install in the areas labeled **INPUT 5** or **INPUT 6**. Options include:

•   Serial Digital Input Module - HD (SDI)

•   DVI Input Module *(standard on XXXX HD models)*

•   Dual SD/HD-SDI Module *(standard on XXXX HD models)*

NOTE: *See **Appendix E – Optional Input Modules** for a brief description of each interface.*

2.4 Connecting Communications

As an alternative to the projector's keypad or remote, you may wish to communicate with the projector using a PC or other controller. Such a device sends commands and receives feedback via serial links (RS232 and RS422), Ethernet or GPIO communications to the projector, all described below.

Remote Keypads

As desired, direct the projector's IR remote keypad towards the display screen or the projector's IR sensors. Alternatively, connect a wired (tethered) version of the remote to the 3.5mm mini-stereo jack labeled as **REMOTE** on the projector's input panel. Note that response to a Wired Keypad must also be enabled in the Communications menu — see *3.6, Adjusting System Parameters and Advanced Controls* for more information.

Serial Port Connections

There are two types of serial ports available on the projector: RS232 and RS422. You can connect a device with a serial interface, such as a computer to either of these connectors (not both) and control the projector remotely by entering specific serial communication commands.

CONNECTING RS-232

The two nine-pin DIN connectors labeled RS232 IN and RS232 OUT on the input panel are dedicated to serial communication (see Figure 2.10). Using the appropriate serial communication cables (see *Appendix B*) connect the controlling source, such as a personal computer to the RS232 IN connector. Then set the baud rate to match that of the computer. Refer to *Section 3* for details on changing the projector's baud rate.
Figure 2.10 Connecting RS-232

CONNECTING RS-422

If you wish to control the projector with a computer and or other controlling device with RS-422 capability, connect a RS-422 serial communication cable between the computer and the RS-422 port on the projector (see Figure 2.11). RS-422 is better suited for serial communication over long distances then is RS-232 communication.

⚠ **Use the RS-422 port only if your device had RS-422 capability – always consult the literature provided with your equipment before connecting. Connecting to the RS-422 port with incompatible equipment could damage your projector.**
Figure 2.11 Connecting RS-422

Ethernet Communications

ETHERNET COMMUNICATIONS

To add the projector to an existing Ethernet network with other equipment such as controllers and other projectors, connect standard CAT5 Ethernet cable between your Ethernet controller (or hub) and the Ethernet port on the side of the projector.

Upon connection to an Ethernet network, the projector's factory default IP address of 0.0.0.0.0 will automatically enable the DHCP function (if available on the network) to assign a new IP address that is valid and unique for that network. Or, if there is no DHCP function available on the network (or if a specific static IP address for the projector is preferred or required), you can set the address in the *Ethernet Settings* menu or via an ASCII serial command.

Regardless of how it is assigned, once a projector has a valid and unique address it will respond to commands sent to this address. To determine the projector's current IP address, consult the *Information or Communications* menus.

Refer to *Section 3* for further information about setting up and using a projector connected via Ethernet.

SETTING THE PROJECTOR'S IP ADDRESS: Upon connection to most Ethernet networks, each projector's factory default IP address of 0.0.0.0 triggers the network's DHCP (Dynamic Host Configuration Protocol) server function to automatically assign an IP address that is valid and unique for use on that network. Depending on the network, this DHCP-assigned IP address usually remains stable for a single session, but may change with subsequent power-ups and logins. On some networks, the address will remain stable from session to session. In all cases, the projector's IP address and port appear in the *Information* menu as well as the *Ethernet Settings* submenu. See Figure 2.12.

Ethernet Settings		
1.	DHCP Enabled	☑
2.	IP Address	000.000.000.000
3.	Port	3002
4.	Subnet Mask	000.000.000.000
5.	Default Gateway	000.000.000.000
6.	Network Name	[ ]

☑ = *Projector's IP address will be DHCP-assigned*
☐ = *Use static address assigned in "IP Address"*

Figure 2.12. Setting the Projector's IP Address

Note that if a projector's IP address is anything *other* than 0.0.0.0 (shown as 000.000.000.000 in the *Ethernet Settings* menu) upon connection to an Ethernet network, or if DHCP is not available on the network, the automatic DHCP server function for supplying a valid and unique IP address to the projector is disabled. Instead, a specific and static IP address must be defined in projector memory—enter the new address in the *Ethernet Settings* submenu, or send to the projector via a serial command. The IP address will be in effect until it is changed again, or until the DHCP checkbox is re-enabled for use with a DHCP server on the network.

CHANGING THE PORT#: On some Ethernet networks, firewall restrictions may require that the port number of the projector be changed from its default of 3002. If so, enter a new port number in the *Ethernet Settings* menu or include the new port# in an XIP serial command sent to the projector. It is highly recommended not to use a port# below 1000, as these ports are typically reserved for and used by common IP applications.

SUBNET MASK AND DEFAULT GATEWAY: The Subnet Mask and Default Gateway are automatically assigned when DHCP is enabled. If a static IP is being used, it must be assigned before the subnet mask. The Default Gateway is an optional router device used to send and receive data outside the subnet.

Separating Networks

By default, communications originating from one type of serial controller — RS232 vs. RS422 vs. Ethernet — stay on the corresponding network path. A "Separate" setting indicates this separation for "Network Routing" in the *Communications* menu. If you are using an RS422 controller, for example, it will communicate only with the projector to which it is connected unless you change this setting to either "RS232 and RS422 Joined" or "All Joined".

2.5 System Integration - GPIO Connector

The GPIO connector on the input panel can be used to provide a method of interfacing a wide range of external I/O devices to the projector.

*Refer to **Appendix D: System Integration** for complete details on pin configuration and how to program the various pins on the connector.*

2.6 Power Connector

⚠ **The North American rated power cord is provided with each projector. Ensure that you are using a power cord, socket and power plug that meets the appropriate local rating standards.**

Plug the power cord to the AC receptacle located at the back of the projector, below the input panel, and the three-pronged end into a grounded AC outlet. Ensure the socket outlet is installed near the equipment and is easily accessible. The input voltage to the projector must be capable of 100 – 240 VAC in 500W and 1000W models and 200-240VAC in 1200W models. *(See also **Section 6 – Specifications** for complete details on all power requirements.)*

Use the approved North American-rated power cord supplied with the projector. If you are connecting to an area outside of North America ensure an appropriately power cord rated for the region of use is used.

Always power down the projector before unplugging the AC power cord. Wait 5-10 minutes for the main exhaust fan to turn off and for the lamp to cool sufficiently before unplugging the projector.

⚠ **WARNING** ⚠

Do not attempt operation if the AC supply and cord are not within the specified voltage and power range.

Wait for the cooling fans to turn off before unplugging the projector.

OPERATION

3.1 About the Projector

This section explains how to effectively operate the projector once it has been installed. It is recommended that you read this section and familiarize yourself with the components and the available menu options before you begin using your projector for the first time.

Top

Front IR Sensor

Projection Lens

Adjustable Feet (4)

Status LED Display

Rear IR Sensor

Built-in Keypad

Input Panel

Intake

Exhaust

Lamp Door

AC Receptacle

Built-in Keypad

The built-in keypad is located at the back of the projector, beside the input panel. Use it similarly to the IR remote to control the projector. A status LED display is also included on this keypad for monitoring projector status.

AC Receptacle

The AC receptacle is located at the back of the projector just below the input panel. Use this outlet to plug in an appropriately rated power cord. Refer to *Section 6 — Specifications* for details.

Adjustable Feet

Located on the underside, and on top with the (i) models, of the projector are four fully adjustable feet. Raise or lower these feet when positioning the projector to ensure it is level on all sides so the displayed image will appear rectangular without any keystone.

Refer to *Section 2 - Projector Position and Mounting (Adjusting projector height)* for instructions on how to adjust the projector's feet.

Lens Mount & Projection Lenses

The projector is built with a motorized lens mount that allows for easy lens control and adjustment. This includes such functions as adjusting vertical and horizontal offsets, zoom and focus. The lens mount can be fitted with any one of the available optional lenses – see *Section 6 — Specifications*.

- **ZOOM AND FOCUS**—There are two internal lens motors that allow for quick motorized adjustment of zoom and focus. Adjust zoom to fit the displayed image on the screen and adjust focus to improve the clarity of the image.

- **LENS OFFSET**—Vertical and horizontal offset is performed on the lens mount through the use of DC motors.

- **SHUTTER**—Standard on all models the shutter allows you to turn the screen absolutely black when in the "on" state. Press the 'mute' button for 1-2 seconds on the remote to operate the shutter.

- **IRIS** — Enables adjustment of light output and contrast ratio.

NOTE: *Use the lens cap when transporting the projector to avoid scratching and damaging the lens, which could affect your displayed image.*

Input Panel

All source connections are made to the input panel located at the back of the projector. Connect RGB or YPbPr sources to **INPUT 1**, analog or digital display signals to **INPUT 2**, composite video to **INPUT 3**, and S-Video to **INPUT 4**. Any of the available optional modules can be installed in **INPUT 5** and/or **INPUT 6**.

There is no status display on the input panel. The only status display is part of the built-in keypad located at the rear of the projector.

Intake and Exhaust

INTAKE COLLAR AND INTAKE BLANK can be interchanged between Intake 1 & 2 depending on where the ducting is originating from.

Intake

Intake Blank

Intake 2

Intake Collar

Intake 1
Exhaust Collar and **Exhaust Blank** can be interchanged between Exhaust 1 & 2 depending where the ducting is originating from. If Exhaust 1 is used the Exhaust Divider must be attached using noted screws. If Exhaust 2 is used the Exhaust Divider must be removed.

Exhaust

Exhaust Divider

Exhaust Blank

Exhaust Collar

Exhaust 2

Exhaust 1

Exhaust Divider Screws
Front and Rear IR Sensors

The two IR sensors located on the projector receive transmissions from the IR remote from up to 100 feet away. It is important to keep the transmission path to these sensors unobstructed for uninterrupted communications with the projector. The Front IR sensor is located next to the projector's nameplate and the rear IR sensor is located at the back of the projector just above the status LED display.

Lamp Door

The lamp door is located at the back of the projector, which provides easy access to the lamp module for replacement. See *Section 4* for lamp replacement procedures.

3.2 Using the Remote or Built-in Keypad

⚠ **Laser radiation is emitted from the laser diode in the remote. Do not look directly into the beam of the remote.**

The projector can be controlled using one of the following keypads:

Keypad Commands

* *Built-in Keypad* located at the back of the projector
* *Remote Keypad* for tethered or tether-less control up to 100 feet away (includes cable for use as a wired remote)

While each of the keypads provides complete control of the projector, they differ slightly in their arrangement of keys and in what functions can be accessed directly with a key press rather than requiring use of the menu system. You may find one keypad more convenient than another for your specific installation and application.

NOTE: *The remote keypad has a single IR protocol and can be converted to a wired remote by connecting the cable provided with the projector to the 3.5mm mini-stereo jack labeled as* **REMOTE** *on the input panel.*

Built-in

To control the projector when signals from a remote keypad cannot reach the projector, use the projector's built-in keypad (Figure 3.1). The nearby LED display provides feedback indicating current status and activities of the projector, (see Table 3.1). Because the built-in keypad has fewer keys than the remote keypad, certain projector functions are accessible only through the menu system rather than via a direct key.

LED status display window

NOTE: *The built-in keypad cannot be disabled.*
Figure 3.1. Built-in Keypad

Refer to the key descriptions provided for the IR remote – see Figure 3.2.

IR Remote

The IR remote keypad controls the projector by way of wireless communications from a battery-powered infrared (IR) transmitter. Use the IR remote keypad the same way you would use a remote keypad supplied with a TV or VCR. When making key presses, direct the keypad either toward the screen or toward the front or rear of the projector. One of the two IR sensors on the projector will detect the signals and relay the commands for internal processing.

LED Status Display

LED STATUS DISPLAY:	DESCRIPTION
- -	AC power supplied, projector Off
On	Projector On
LC	Lens calibration in progress
LP	Lamp has reached defined "Lamp Limit" refer to 3.9 Working with the Lamp
SH	Closed shutter
# #	System warning or error has occurred
☰	Cooling down (Rotating Horizontal Bars)
⌐	Power to Off state or Powering up (segments spinning clockwise

Table 3.1.
LED Status Display

Test
• *Display a test pattern*

Power*
• *Turn projector ON or OFF*

Inputs
• *Display from this source*

NOTE: If PIP is on, Input keys affect the PIP window only.

PIP
• *Turn picture-in-picture ON or OFF*

Menu*
• *Display menus (toggle)*

Arrow Keys
• *Adjust a setting up or down*
• *Navigate within a menu*

Channel
• *Select channel (setup)*

Laser
• *Activate laser pointer at front of keypad*

Gamma
• *Adjust mid-range levels*

Number Keys
• *Enter a number, such as channel, value, etc.*

NOTE: Can be set to select inputs if desired.

Shutter*
• *Open or close the shutter*

Quick Setup
• *Optimize image automatically*

Lens Functions
• *Use◄ and ►keys to adjust parameters*

OSD*
• *Use to hide or show menus*

Exit
• *Return to previous menu level*

Enter
• *Select a highlighted menu item; change or accept a value*

Projector
• *Select a projector in multi-projector installations*

Bright
• *Adjust amount of light in image*

Contrast
• *Adjust difference between light / dark*

Func
• *Enter special code such as color enabling*

Help
• *Display context-sensitive help (toggle)*

Labels on keypad: Power, Test, Shutter, Quick Setup, Input 1 BNC, Input 2 DVI, Focus, Input 3 Vid, Input 4 S-Vid, Zoom, Input 5 Opt 1, Input 6 Opt 2, Lens H, Lens V, PIP, OSD, Menu, Exit, Channel, Laser, Proj, Gamma, Contrast, Bright, 1, 2, 3, 4, 5, 6, 7, 8, 9, ? Help, 0, Func, WOLF CINEMA

* TOGGLE KEYS =

Press *and hold* to toggle or press twice to toggle or press and *release*, followed by ▲ ON or ▼ OFF

* These are toggle keys, which require you to press and hold or press twice or press and use the up/down arrow keys.

NOTE: *To turn the OSD off you must press* ⟨OSD⟩ *and* ⟨▼⟩.

Wired Remote

You can convert the IR remote into a wired remote keypad using the cable provided with the projector. Connect one end into the remote and the other to the mini stereo connector on the input panel labeled as **REMOTE**. The wired remote is recommended when:

- The built-in keypad is inaccessible
- The lighting conditions are unsuitable for proper IR transmission

NOTE: *Leave the batteries in the wired remote for the laser key (⊶) to work.*

Guide to Keypads

Keep in mind the following guidelines:
- Press keys one-at-a-time; there are no simultaneous key combinations required.
- Note that the three keys — Power ⊙, Shutter ⧉ and OSD ⊙sd are "press-and-hold" keys that do not function with a typical quick press-and-release key press (see Figure 3.2).
- Hold arrow keys down for continuous adjustment/movement in one direction. In serial networks, pause briefly between adjustments to ensure that other devices can "keep up" with the commands.
- If you press a key while the projector is still responding to the previous action, such as during power-up, the second key press may not take effect.

Keypad Commands

Specific keypad commands are explained below:

⊙ **POWER ON/OFF**

Press *and hold* ⊙ for two seconds or press twice quickly to toggle the projector (on) or (off) with a single keystroke. Or press and release ⊙ followed immediately by ⏶ (on) or ⏷ (off) to guarantee the correct toggle (useful if you are unsure of the present state).

NOTES: 1) *After powering down, the lamp cooling fan remains on for approximately five minutes to cool the lamp.* **2)** *It is a good idea to avoid turning a projector back on until it has been off for a few minutes. Hot re-strikes of the lamp may reduce lamp life.*

Test **TEST**

Press Test to step forward through all internal test patterns and this will eventually lead you to the current input. If you press Test and then cycle by using the ◄ and ► right arrow keys, you'll be cycling in either direction through the test patterns only, no input.

Quick Setup **QUICK SETUP**

Press Quick Setup to initiate an automated process in which the projector optimizes critical display parameters such as size, position, pixel tracking, etc., for the current source. These parameters are listed in Table 3.2. A *Quick Setup* can save time in perfecting a display and you can modify the adjustments as desired.

| What a "Quick Setup" Does ||
OPTIMIZES:	SETS TO DEFAULT:
Pixel Tracking	Contrast
Pixel Phase	Brightness
Size and Blanking	Auto Input Level (Off)
SVertical Stretch	Detail (if video source)
Position	Filter
Color Temp	Luma Delay

Table 3.2. Quick Setup

NOTE: *You must have an unlocked channel present to use Quick Setup.*

Channel

CHANNEL

Press (Channel) to select a specific source setup (*channel*) defined and stored in projector memory. Once you enter a two-digit channel number (or, if there is a list displayed, highlight it and press (↵)), the display will automatically change and update according to the numerous setup parameters defined for that channel. Note that a new channel is automatically created if you adjust an image from a new source.

NOTE: *Channel ((Channel)) key behavior during a presentation depends on whether or not the* **Display Channel List** *option is enabled in the* **Menu Preferences** *menu. You can choose to use a scrollable list of channels when you press (Channel) , or you may prefer to enter the desired channel number "blind", i.e., without on-screen feedback. See* **Menu Preferences** *later in this section.*

Input 1

INPUT 1

Press (Input 1) to display from the data or video input source connected to BNCs labeled **INPUT 1**.

Input 2

INPUT 2

Press (Input 2) to display from the DVI source connected to **INPUT 2**.

Input 3

INPUT 3

Press (Input 3) to display from the composite video source connected to **INPUT 3**.

Input 4

INPUT 4

Press (Input 4) to display from the S-Video source connected to **INPUT 4**.

Input 5

INPUT 5

Press (Input 5) to display from the **INPUT 5** interface module installed in the Option 1 slot.

NOTE: *If you have the optional Dual SD/HD-SDI Module installed and there are two inputs connected here, the second input (B) is considered* **INPUT 7**. *If you are using the built-in keypad or the remote keypad, press* **INPUT 5** *to access* **INPUT 7** *as follows:*

• *While displaying from* **INPUT 5**, *press* (Input 5) *again. This switches to* **INPUT 7**.

• *While displaying from any input other than the Dual SD/HD-SDI Module, press* (Input 5). *This switches to either* **INPUT 5** *or* **INPUT 7**, *depending on which of the Dual SD/HD-SDI Module inputs (A or B) was last used. Press* (Input 5) *again to display from the other Dual SD/HD-SDI Module input.*

Input 6

INPUT 6

Press (Input 6) to display from the *INPUT 6* interface module installed in the Option 2 slot.

NOTE: *If you have the optional Dual SD/HD-SDI Module installed and there are two inputs connected here, the second input (B) is considered* **INPUT 8.** *If you are using the built-in keypad or the remote keypad, press* **INPUT 6** *to access* **INPUT 8** *as follows:*

• *While displaying from* **INPUT 6**, *press* (Input 5) *again. This switches to INPUT 8.*

• *While displaying from any input other than the Dual SD/HD-SDI Module, press* (Input 5), *which switches to either* **INPUT 5** *or* **INPUT 8**, *depending on which of the Dual SD/HD-SDI Module inputs (A or B) was last used. Press* (Input 5) *again to display from the other Dual SD/HD-SDI Module input.*

Contrast

CONTRAST

Press (Contrast) to change the amount of white in your images. Use ◄ ► keys until you reach the desired level of contrast — for best results, start low and increase so that whites remain bright but are not distorted or tinted and that light areas do not become white (i.e., "crushed"). Conversely, low contrast causes dim images. See *3.5, Adjusting the Image* (*Picture Adjustments* subsection).

Bright

BRIGHTNESS

Press (Bright) to increase or decrease the amount of black in the image. Use ◄ ► keys until you reach the desired level of contrast—for best results, start high and decrease so that dark areas do not become black (i.e., "crushed"). Conversely, overly high brightness changes black to dark gray, causing washed-out images. See *3.5, Adjusting the Image* (*Picture Adjustments* subsection).

Gamma

GAMMA

"Gamma" determines how gray shades are displayed between minimum input (black) and maximum input (white) for a given amount of signal. The proper setting helps maintain optimized blacks and whites while ensuring a smooth transition for the "in-between" values utilized in grays. Unlike brightness and contrast controls, the overall tone of an image can be lightened or darkened without changing the two extremes and your images will be more vibrant yet with good detail in dark areas when using the Gamma control.

The normal gamma setting of 2.2 is correct for most video and 2.6 for film. If excess ambient light washes out the image and it becomes difficult or impossible to see details in dark areas, lower the gamma setting to compensate. This will improve contrast ratio while maintaining good details for blacks and whites

Menu

MENU

Press (Menu) to enter or exit the projector's menu system.

OSD

OSD (ON-SCREEN DISPLAY)

Press (OSD) ▼ to hide the projector's menu system during use. To see the menus again, do one of the following:
• Press *and hold* (OSD) for two seconds
• Press and release (OSD) followed immediately by ▲.
• Press (OSD) (OSD)
Invisible menus are fully functional, enabling "hidden" access to numbered features and image adjustments by entering the corresponding sequence of key presses on the keypad.

NOTE: *With OSD "on", you can still hide error messages and slide bars by disabling these options in the* **Menu Preferences** *menu.*

Shutter

SHUTTER

Press *and hold* (Shutter) for two seconds to toggle the internal mechanical shutter blade closed or open with a single keystroke. Or press and release (Shutter) followed immediately by ▲ (closed) or ▼ (open) to guarantee the correct toggle (useful if you are unsure of the present state). Alternatively, press (Shutter) (Shutter) to toggle from the present on/off state. A closed shutter blanks the display (turns it to black). Close the shutter to mute all display while maintaining access to projector functions. Opening the shutter restores the image.

NOTES: 1) *The status display shows "5H", when the shutter is closed.* **2)** *The shutter is open upon power-up.*

(Func)

FUNCTION KEY

IF WITHIN A MENU: Using the (Func) for special tasks within the menu system is noted with the appropriate topic elsewhere in *Section 3*. For example, press (Func) in the *Channel Setup* menu to enable deletion or copying of a channel.

SETUP FUNCTIONS: Press (Func) followed by a 2-digit number to enable a specific color or colors in the display (see right). For example, (Func) (6) (4) will display only red and green data, (Func) (6) (7) will display all color data. Eliminating one or more colors can help with certain diagnostics and setups.

(Func)(6)(1)	= Red
(Func)(6)(2)	= Green
(Func)(6)(3)	= Blue
(Func)(6)(4)	= Red & Green
(Func)(6)(5)	= Green & Blue
(Func)(6)(6)	= Red & Blue
(Func)(6)(7)	= All Colors

NOTE: *Color enabling can also be implemented from numerous locations within the menu system.*

(Proj)

PROJECTOR

Press (Proj) to access a specific projector within a group of projectors or to confirm if the local projector is listening. The number in the "Enter Number" window indicates which projector is currently listening to commands, and will match the projector number that has been defined in the *Menu Preferences* menu.

The "Projector" checkbox (read-only) shows whether or not the projector physically connected to a keypad is listening to commands from that keypad. A checkmark means that connected projector is listening; if there is no checkmark, you are communicating with a different projector.

To control a specific projector with the keypad, press (Proj) and then enter the three-digit number assigned to the projector you want to use. If you switch to a projector other than the one you are currently using, the checkmark will disappear.

To broadcast to multiple projectors, press (Proj) and then (Proj) again *without* entering a projector number. Keypad commands will then affect all projectors present. Note that there is no method of controlling a group of projectors within the same wired configuration using the Wired Keypad exclusively, since there is only one wired protocol available.

NOTES: 1) *The "Broadcast Keys" option in the Communications menu must be selected for only one (any) projector in a serial network. The keypad in use must be OFF (disabled) for the remaining projectors.* **2)** *See 3.6, Adjusting System Parameters and Advanced Controls.*

(↵)

ENTER

Press (↵) to select a highlighted item, to toggle a checkbox, or to accept a parameter adjustment and return to the previous menu or image.

(Exit)

EXIT

Press (Exit) to return to the previous level, such as the previous menu.

NOTE: (Exit) *does not save changes within text editing boxes (including number editing of a slide bar value) or within pull-down lists. It acts as a "cancel" in these cases.*

ARROW KEYS

Use the ◄ ► keys to change a slidebar value or to select a different option within a pull-down list without having to first scroll through options. See also *Editing Text later in* **Section 3**.

Use the ▲ ▼ keys to navigate within a menu, pull-down list or text box.

LENS FOCUS, ZOOM AND LENS H SHIFT, LENS V SHIFT

When adjusting the image for focus, zoom, horizontal and vertical positioning, use the specific arrow keys (◄ / ► or ▲ / ▼) related to each function. A small window will appear to indicate the type of adjustment taking place. For example,

• Use the "Focus" ◄ or ► keys to improve image clarity as desired.

• Use the "Zoom" ◄ or ► keys to achieve a desired image size.

• Use the "Lens H" ◄ or ► keys to position the image horizontally while still keeping it rectangular.

• Use the "Lens V" ▲ or ▼ keys to position the image vertically while still keeping it rectangular.

Press Exit to return to presentation level.

NOTE: *Use the* Lens Shift *key (built-in keypad) with the general* ▲ ▼ *keys to get the same effect as if using the arrow keys related to "Lens V" or "Lens H" on the IR remote.*

LASER

Press ━• to activate the laser pointer on the remote. This feature is useful when making presentations - just point the remote at the screen to highlight an area of your presentation. The closer you are to the screen the brighter the laser beam appears. The laser pointer works best in an environment where ambient lighting can be controlled.

CAUTION

**LASER RADIATION
DO NOT STARE INTO BEAM**

LASER DIODE

**Wavelength 670nm
Max Output 1mW
CLASS II LASER PRODUCT**
NOTE: *Leave batteries in the wired remote keypad for the* ━• *key to work.*

3.3 Navigating the Menus

Most of the controls for the projector are accessed from within the projector's menu system. There are several groups of related functions, with each group selectable from the Main menu as shown at right. Press ⟨Menu⟩ at any time to display this Main menu.

[menu] ➡️

Main Menu

1. Geometry and Position
2. Picture Adjustments
3. Channel Setup
4. Display Setup
5. Lamp
6. Information
7. PIP
8. Test Pattern   🌐 **Off**   ▼
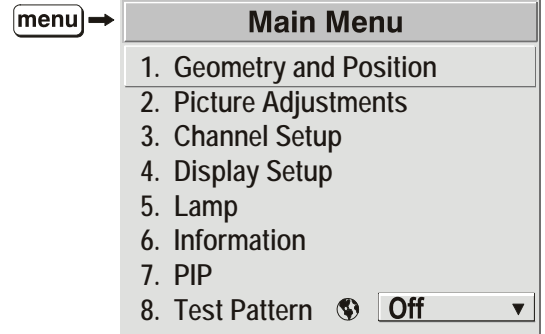

On the remote keypad, either enter the number corresponding to the function menu you wish to access, such as ② for the Picture Adjustments menu, or use the ⟨▲⟩ ⟨▼⟩ keys on any keypad to highlight the desired option, then press ⟨↵⟩. The corresponding function menu or pull-down list of further options will then appear.

With a function menu displayed, navigate in a similar manner—enter a menu option number for any numbered option, or use the keys to highlight the desired option, then press ⟨↵⟩. Extra long menus have a scroll bar on the right—use the arrow keys to access the remainder of the menu. Locked items or items that do not pertain to the current action or condition appear dimmed and cannot be selected.

NOTES: 1) *If there is no signal present, all source-dependent adjustments are disabled.* **2)** *After 15 minutes of inactivity, the projector leaves the menu system and returns to the presentation.* **3)** *The Information menu is read-only.*

When finished with a function menu, do one of the following:
• Press ⟨Exit⟩ to return to the previous screen
• Press ⟨Menu⟩ to leave the menu system and return to the presentation

On-Line Help

If at any time you are uncertain what to do next, press ⟨Help⟩ to display summary information about the current menu or highlighted option. Press ⟨Help⟩ again to exit. In addition, a line of "hint" text is included at the bottom of some menus.

Lamp

	Lamp Hours	0
	Lamp S/N	?
1.	Lamp Message	🌐 ☑
2.	Lamp Limit	🌐 1000
3.	Lamp Mode	🌐 Power ▼
4.	Power	🌐 500
5.	Intensity	🌐 0
6.	Iris	🌐 3
7.	Lamp History	
8.	Change Lamp	

⟨Help⟩ ➡️

LAMP MESSAGE HELP

Enable a notice upon power-up indicating the lamp has logged a given number of hours as specified by the lamp limit (default is lamp specific).
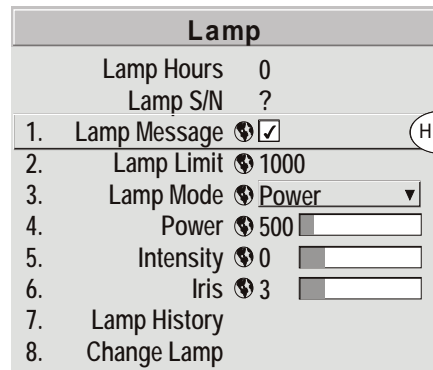

Press (Help) from the presentation level to access general *Help Topics*. Scroll as necessary within a topic; press (Help) or (Exit) to return to your presentation.

Help Topics
1. **Using Help**
2. **Setup**
3. **Keys**
4. **Source (Input) Selection**
5. **2 Digit Status Display**

[Help] ➡ (pointing to item 2)

Time-outs

If a slidebar, menu or message is displayed you have limited time in which to make a keypad entry before the projector returns to presentation level and the graphic disappears. These time-outs may vary depending on what is displayed.

The Global Icon

Menu options that include this icon apply universally to any incoming signal.

Using Slidebars and Other Controls

Most of the function menus allow you to change settings by using slidebars, checkboxes, and pull-down lists. To select a slidebar, toggle a checkbox status or view a pull-down list, do one of the following within the function menu:

• Enter the menu option number corresponding to the setting you wish to change (for example, press (Menu) (1) (3) to select Vertical Stretch in the Size & Position menu).

• Move the highlight to the option desired and press (↵) (Enter).

• Move the highlight to the option desired and press (◄) (►) to adjust immediately.

• Bypass the menus entirely and use a single key to immediately access an adjustment during your presentation (**NOTE:** applies only to options having their own key, such as Focus, Zoom, etc.).

• For "blind" access, hide the entire menu system (see OSD key, above) and/or direct slidebars activated by their own key (such as Contrast, Brightness, etc.). Control by using the proper keypress or numerical sequence of key presses.

Once selected, change the setting as desired (see below) and press (↵) to save and return to the current function menu.

SLIDEBARS IN MENUS—The current value for a given parameter, such as size or vertical stretch, appears to the left of its slidebar icon (adjustment window). This number often expresses a percentage, or it may have units associated with it (such as pixels, degrees Kelvin, etc.), depending on the specific option. Press ◄ ► to gradually adjust the setting up or down — both the number and the length of the bar change accordingly. Hold for continuous adjustment. Or press ↵ to activate a slidebar text box for specific number entry via the keypad, then press ↵ to save (or press Exit to cancel).

`Filter    5 ▭`

"DIRECT" SLIDEBARS— For quick access, you can access Gamma, Brightness, and Contrast slide bars without traveling the menu system. For example, simply press Cont to immediately display the same contrast slide bar accessed with the Contrast option in the *Picture Adjustments* menu.

Use the arrow keys to adjust a direct slide bar, or press ↵ and enter a specific number from the keypad, then ↵ or ◄ or ► to save (or Exit to cancel). When you are done, press Exit to save and return to your presentation.

NOTES: 1) *You can still adjust a direct slidebar as usual if the display is turned off (see OSD or Menu Preferences menu) — the slidebar just won't be visible.* **2)** *A direct slidebar disappears if it is not used within 5 seconds.*

CHECKBOXES—Conditions are present if its adjacent checkbox contains a checkmark. To toggle the checkbox, simply highlight and press ↵, or highlight and use ► to check and ◄ to uncheck. If a checkbox is numbered, simply enter its number to immediately toggle the checkbox.

`5.   Broadcast Keys  ☑`

PULL-DOWN LISTS—To see a pull-down list of options available for a given parameter labeled with a ▼, you can:

•   Highlight it and press ↵ (Enter)

•   Enter the menu option number

Use the ▲ or ▼ keys to navigate up and down within the list (the current choice is noted with a small ►). Press ↵ to choose an option from the list, if desired. (See Figure 3.3).
Figure 3.3. Example of Pull-Down List

If you prefer to quickly scroll through a list without first pulling it down, highlight the option and use ◄ or ►. Press ↵ when the desired choice appears.

NOTES: 1) *Press ◄ or ► to jump between pages in an extra long pull-down list.* **2)** *Press Exit while in a pull-down list to* **cancel** *any change.*

Editing Text

ACTIVATE THE EDIT WINDOW: To enter or edit text, highlight the desired parameter (such as a channel name) and press ↵ to activate its adjacent edit window. Any previously entered text is displayed with its first character highlighted in a square cursor, signifying that this character is ready for editing.

NAVIGATE WITHIN THE EDIT WINDOW: Press ➤ to move the cursor forward or ◄ to move the cursor backwards as desired.

EDIT A CHARACTER: To edit a highlighted character, use ▲ and ▼ to scroll through the alphabet, numbers, spaces and punctuation available. When the character you need appears, press ➤ to select it — the cursor will move to the next character of current text, if present. Note that you can also enter a number directly from the keypad — it will be accepted and the cursor will move on.

Cursor (highlight). Move with ◄− +►

2.35

▲ON } *scroll alphabet, numbers, etc.* } *Press* +► *to select and go to next*
▼OFF
Figure 3.4. Entering Text

ADD OR DELETE A CHARACTER OR SPACE: To insert a space at the cursor location, press Func ➤. To delete a highlighted character (or space), press Func ◄.

2.35

Press Func +► *to insert a space before*

2.3 5

Figure 3.5. Adding Text

2.35

Press Func ◄− *to delete*

2.3
Figure 3.6. Deleting Text

PRESS ↵ (ENTER) WHEN FINISHED: To accept edits and leave the edit window, press ↵ (Enter).

NOTE: *Press* Exit *at any time to cancel changes and return to the previously-defined text.*

Editing Numerical Values

Enter numbers directly from the keypad in order to specify numbers representing projectors, channels (source setups) or slots. As each digit is entered, it is displayed and the cursor moves on. Note that channel numbers are defined with 2 digits—for example, if you enter only a single digit (such as "7") for a channel number, the channel will automatically be defined as "07". Enter "07" to utilize this channel.

NOTES: 1) *Once you enter the first digit, this digit replaces all old digits.* **2)** *If you press any non-numbered key, the number entered up to that point is accepted and updated as the new value.* **3)** *Press* Exit *to cancel editing of numerical values.*

3.4 Using Inputs and Channels

NOTE: *See **Section 2, Installation and Setup**, for details on connecting sources to the projector.*

The projector stores and automatically recalls up to 50 different channels (source setups) for a variety of inputs. This memory feature allows you to define and conveniently use a wide variety of customized setups rather than having to repeatedly re-configure the projector for different presentations. Depending on what you have defined, each physical source connection (i.e., input at the projector) can have several different channels associated with it.

Do I Select an Input or a Channel?

INPUT—An input is a source physically connected at the projector. (Input) describes the source signal according to which input slot it is connected.

SWITCHING INPUTS—Press the appropriate "direct" key — (Input 1), (Input 2), (Input 3), (Input 4), (Input 5) or (Input 6) to quickly display from one of the six inputs connected. The image will be displayed according to the following:

If it is the first time you have used the source/input (or if you used the input but did not define a channel by adjusting anything), the projector will recognize the new input signal based on its frequencies and polarities, and will automatically display an image according to default settings for such a signal. In general, the image from the new source will be as large as possible without losing its aspect ratio. This and other default Picture Adjustments depend on the incoming source.

If you used the source once before and changed a display parameter such as contrast, V-Position, etc., then a channel was automatically created and still exists in projector memory (see below). Using one of the (Input) keys will automatically recall this channel — and all its setup parameters — and update the display accordingly.

If more than one channel exists for the input, the image will be displayed according to the setup parameters for the first channel with matching characteristics.

NOTE: *Inputs 7 and 8 require the **Dual SD/HD-SDI** module in either of the projector's option slots. For their selection, see also **3.2 Using the Remote or Built-In Keypad**.*

CHANNEL— A channel is a collection of measurements, locations and settings that tailor the display of a signal to your specific needs. Since source types and applications can vary greatly, you will likely want to adjust and define a wide variety of parameters, such as brightness, contrast, aspect ratio, etc., in order to customize and optimize the display from or for a particular source. For example, the display settings you choose for a VCR source may be very different from those you choose for a high resolution computer source, or one signal may simply vary from another signal used previously through the same input location. Once you have adjusted a display parameter, such as pixel tracking or contrast, all current settings are collectively stored in the projector's memory as a unique 2-digit channel, such as (0) (9). You can have numerous distinct channels available for the same input, any of which can be selected by using the (Channel) key on the keypad followed by the 2-digit channel number.

Shown at right is a sample channel list as would be available from ⟨Channel⟩. This is typically called the *channel* list.

NOTE: *The* ⟨Channel⟩ *key may display a channel list or not, depending on what you have defined for "Display Channel List" (see **Menu Preferences** later in this section).*

In order to access channels by using ⟨Channel⟩ on the keypad, you must first create the channels. See below.

[chan]

Channel: 02

current channel#

01	0,2	pDig	64.09k+	60.12+
02	0,1	i3LG	33.72–	59.94–
03	0,4	iSVid	15.73k–	59.94–
04	0,3	pCVid	15.73+	59.94+
05	0,1	p4WH	Fred's computer	

channel#   signal type   H and V frequencies, or channel name
location

Figure 3.7. Channel List

Creating a New Channel – AUTOMATIC –

To use a new source with the projector, a new channel must be added to projector memory so that the projector will respond properly to an input signal from that source in the future. A new channel can be created automatically, as described here, or it can be copied from an existing channel and then edited as necessary (see Copying or Deleting Channels later in this section).

When you select a direct input (⟨Input 1⟩, ⟨Input 2⟩, ⟨Input 3⟩, ⟨Input 4⟩, ⟨Input 5⟩ or ⟨Input 6⟩), any existing channels in the projector are searched for matching input and signal parameters – this only occurs if Auto Source is enabled on these channels. If no match to the incoming input signal is found in currently-defined channels, a new channel is temporarily created based on factory-defined defaults for this type of signal. The channel number assigned is the lowest available number from 01-50.

NOTES: 1) *An automatic channel will be discarded unless one or more of its parameters are changed and will not appear in the channel list (see below).* **2)** *If two channels have the same distinguishing source characteristics except for the reversal of sync connectors (i.e., H-sync and V-sync, are switched), they are still defined as distinct channels.* **3)** *You cannot define a new channel without an incoming signal.*

If the incoming signal does match an existing channel, the image will be set up and displayed as usual according to the parameters currently defined for that channel.

USING A CHANNEL: You can normally select a channel at any time by pressing ⟨Channel⟩ (see below). If you want to prevent a channel from appearing in this list, you must edit the channel as described in *Channel Edit* later in this section. Such a channel can still be selected by entering its number as shown at right.

NOTES: 1) *The current channel is highlighted upon entering the channel list, or, if this channel is not displayed here, the first channel in the list is highlighted.* **2)** *Channels created automatically do not appear in the channel list unless a parameter for the channel has been changed.*

current channel#

TO CHANGE CHANNEL :
• Enter 2-digit channel#
or
• Move highlight and press ⟨Enter⟩

Figure 3.8. Current Channel

What Channels are defined so far?

All available channels are listed in the *Channel Setup* menu, which describes how each channel can be accessed and which serves as the gateway for editing, copying and deleting channels.
Figure 3.9. All Channels Appear in the Channel Setup Menu

Press ⬭Menu⬭ from the presentation level to display the Main menu. To display the *Channel Setup* menu, press ⬭3⬭, or move the highlight to the *Channel Setup* option and press ⬭↵⬭. The *Channel Setup* menu will appear (see sample above), with the active channel highlighted.

WHAT APPEARS IN CHANNEL SETUP MENU? This menu lists all channels defined so far and indicates where they are connected on the input panel. The far left column lists channel numbers currently defined. The values in the far right columns indicate horizontal and vertical frequencies — if someone has defined a name for this channel, it appears here instead. Remaining columns contain details pertaining to each channel setup, such as its switcher number (always 0 = projector), slot location, a variety of icons indicating access to each channel, and an abbreviated description of each signal type. See *Editing a Channel Setup* for details.

NOTE: *If you have more than a handful of channels, use* ⬭◄⬭ *and* ⬭►⬭ *to see the remaining channels not visible in the initial display of channels.*

SIGNAL TYPE — Either channel list, whether the ⬭Channel⬭ key list or the Channel Setup menu, identifies signal types in a shortened form as defined below. These descriptors indicate what signal information the projector uses to identify a match for a given channel, and are preceded by either an "i" (interlaced signals) or "p" (progressive signal"). See Table 3.3.

Table 3.3. Abbreviations for Signal Type

Abbreviation	Signal Type
4WH	Composite (4 wire) on HC input
4WV	Composite (4 wire) on V input
SG	Sync-on-green
5W	Separate H,V
5WR	Separate H,V swapped
SVid	S-Vid
CVid	Composite Video
Dig	Digital

FUNCTIONS WITHIN THE CHANNEL SETUP MENU — To copy, delete or edit a channel, highlight the desired channel in the Channel Setup menu and do one of two things:

• Press ⬭Func⬭ if you want to copy the selected channel or delete this or other channels. See *Copying or Deleting a Channel* on the next page.

• Press ⬭↵⬭ if you want to edit channel setups (i.e., non-image related parameters) for the selected channel. See *Editing a Channel Setup*, on the following pages.

FUNCTIONS WITHIN THE CHANNEL SETUP MENU—To copy, delete or edit a channel, highlight the desired channel in the Channel Setup menu and do one of two things:

- Press (Func) if you want to copy the selected channel or delete this or other channels. See *Copying or Deleting a Channel* below.

- Press (↵) if you want to edit channel setups (i.e., non-image related parameters) for the selected channel. See *Editing a Channel Setup*, below.

Copying or Deleting Channels

TO COPY A CHANNEL, highlight the desired channel in the *Channel Setup* menu, then press (Func) to go to the *Channel Copy/Delete* submenu. Select "Copy" and press (↵) — a new channel will be created. It is identical to original, which still remains, but it is identified with the next available number from 01-50. If you change your mind and do not want to copy the current channel, press (Exit) to cancel and return to the previous menu. Copying channels is a quick method for creating numerous channels, each of which can then be edited and adjusted for a variety of aspect ratios in the future.
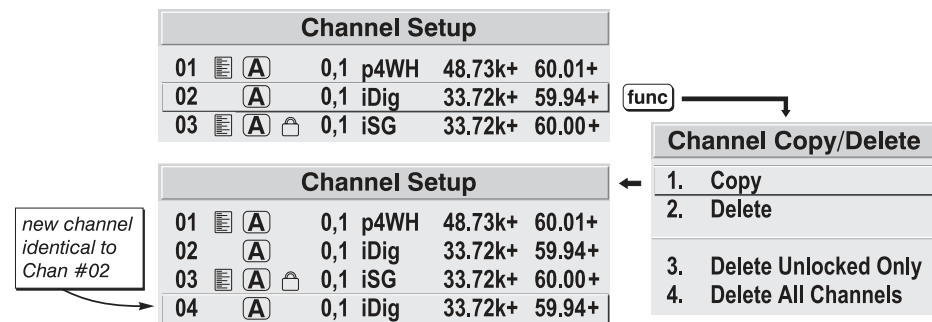

Figure 3.10. Copying a Channel

TO DELETE A CHANNEL, highlight the desired channel in the *Channel Setup* menu, then press (Func) to activate the *Channel Copy/Delete* submenu. Select "Delete" and press (↵) — a confirmation window will appear to make sure that you really want to delete this channel. See Figure 3.11.
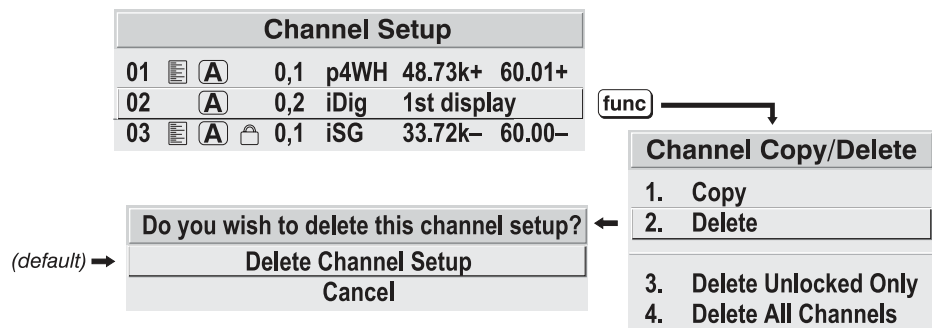

Figure 3.11. Deleting a Channel

TO DELETE MULTIPLE CHANNELS, highlight any channel in the *Channel Setup* menu and press ⬭Func⬭ to go to the *Channel Copy/Delete* submenu. Select "Delete Unlocked Only" and press ⬭↵⬭ to delete all unlocked channels. Or select "Delete All Channels" to delete all channels, even those that are locked. In either case, the current channel will remain but will be redefined from projector defaults.

NOTE: *For any deletion, a confirmation box appears to make sure that you really want to delete. Select "Cancel" (default) if you don't want to delete after all.*

Editing a Channel Setup

The basic setups that describe how and where a channel can be accessed are listed in the *Channel Setup* menu. These channel setups can be edited at any time in the *Channel Edit* submenu.

Press ⬭Menu⬭ from the presentation level to display the main menu. To display the *Channel Setup* menu, press ⬭3⬭, or move the highlight to the *Channel Setup* option and press ⬭↵⬭. The *Channel Setup* menu will appear.

To edit parameters shown in the *Channel Setup* menu, select the relevant channel and press ⬭↵⬭. The *Channel Edit* menu will appear similar to the sample shown below.

Editable

Channel Edit

1.	Name	pres2	Sync Type	Digital
2.	Number	09	H-Sync	63.75 kHz +
3.	Input	1	V-Sync	60.02 Hz +
4.	In Menu 🖹	☑	Interlace	No
5.	Auto Source Ⓐ	☑		
6.	Locked 🔒	☑		
7.	Previous Channel			
8.	Next Channel			

read-only

hint text
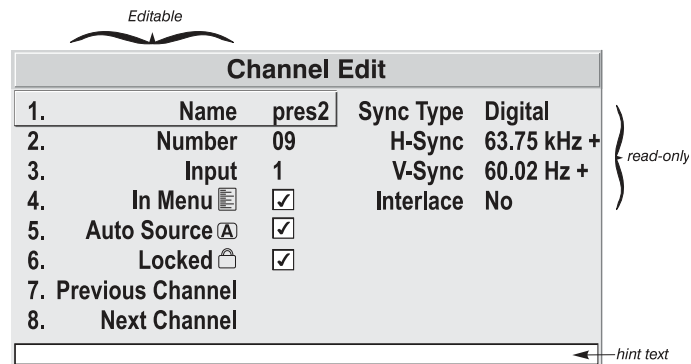

Figure 3.12. Channel Edit Menu (SAMPLE)

If desired, review and/or edit the following channel setups in the *Channel Edit* menu:

• **CHANNEL NAME:** An alpha-numeric label can be defined and/or changed here. Channel names can be up to 12 characters in length.

• **CHANNEL NUMBER:** A 2-digit channel number can be changed here.

   NOTES: 1) *If you enter a channel number that already exists, a dialog message appears indicating that this number is already in use – assign a different channel number.* **2)** *You can define up to 50 channels.*

• **INPUT:** 1-8, corresponding to where on the projector's input panel the source is connected.

• **IN MENU:** If checked (default, except for automatically defined channels with unchanged parameters), this defined channel will then appear in the list available when ⬭Channel⬭ key is pressed. If unchecked, the channel must be accessed via ⬭Channel⬭ on the keypad or via the Auto Source function.

   NOTE: *Onscreen display of the channel list is an option that must be set in the **Menu Preferences** menu.*

- **AUTO SOURCE:** If checked, (default), the projector can automatically locate this channel when an incoming input signal matches. If not checked, the projector can locate the selected channel only when it is directly selected via ⬭Channel on the keypad — and a change in input signal will *not* result in a channel change.

- **LOCKED:** If checked, all of the Picture Adjustments for this channel are disabled. If unchecked (default), all available Picture Adjustments can be adjusted as desired. You cannot use Quick Setup with a locked channel.

- **PREVIOUS CHANNEL:** Select this option to see or change *Channel Edit* settings for the previous channel in the *Channel Setup* list.

- **NEXT CHANNEL:** Select this option to see or change *Channel Edit* settings for the next channel in the *Channel Setup* list.

3.5 Adjusting the Image

The most commonly used options for image adjustments are accessed through two menus: *Geometry and Position* (⬭Menu ⬭1) and *Picture Adjustments* (⬭Menu ⬭2), both of which appear in the Main menu. From either of these two menus, you can change settings affecting the image from the current channel by working with the appropriate slide bars, checkboxes and pull-down lists. ⬭Exit will return to the previous menu (or to the presentation, if from the Main menu) and accept any changes you may have entered. Settings are saved with the current channel.

From your presentation, you can access any of the individual options in these menus by pressing ⬭Menu followed by the appropriate two-digit number representing their location in the menu system. For example, press ⬭Menu ⬭2 ⬭3 to quickly access the "Gamma" option in the *Picture Adjustments* menu.

Note that for certain options, you may prefer to use a "direct key" from presentation level to go directly to a particular option without traveling through the menu system (*available for certain display parameters only*). For example, press ⬭Contrast to access the "contrast" slide bar immediately. Press ⬭Exit to return to your presentation.

NOTES: 1) *To hide these "direct" slide bars, disable the "Display Slide bars" checkbox in the* **Menu Preferences** *menu.* **2)** *To hide the entire menu system from view, turn off the on-screen display by pressing* ⬭OSD ⬭▼*.*

Before You Begin
USE QUICK SETUP *(⬭Quick Setup)*
For a good and efficient first step in perfecting the image, press ⬭Quick Setup. This initiates an automated process in which the projector quickly optimizes critical display parameters such as size, position, pixel tracking, etc., based on the type of incoming source data detected. An *Quick Setup* can save considerable setup time, and you can still modify the adjustments as desired using menu options described below.

Geometry and Position Menu

In the *Geometry and Position* menu, you can increase or decrease the size of your image, change its proportion (aspect ratio), move the image to a specific area of the screen, and refine other related parameters. Use *Geometry and Position* controls to match the image precisely to the screen used at the site.

Geometry and Position		
1.	Resize Presets	No Resizing ▼
2.	Size	1000
3.	Vertical Stretch	1000
4.	Pixel Track	858
5.	Pixel Phase	0
6.	H-Position	360
7.	V-Position	262
8.		
9.		
0.	Advanced Size and Position	

Refer to *"Using Slidebars and Other Controls"* (earlier in this section) if you need help using any of the options and controls. Changes made in the *Geometry and Position* menu are applied immediately and are saved when you exit the menu (press ⬭Exit or ⬭Menu).

RESIZE PRESETS
NOTE: *The same resize presets are available to all HD and HD2 widescreen models. Please note however, the graphics used to describe each preset in this section are of the SXGA+ models only.*

Select a *Resize Presets* option to quickly display an image in its native resolution or to automatically resize an image to closely fill the projector's native resolution or to optimize the width or height of your display. *Size, Position and Blanking* parameters will automatically adjust accordingly or, if Blanking is set first, which defines an Active Input Area; *Resize Preset* scaling will occur in this region of interest only. Resizing options are explained in detail below.

Resize Presets	
1. Default	= **maximize for current source**
2. No Resizing	= **display in native resolution**
3. Full Size	= **fill the screen (regardless of source)**
4. Full Width	= **fill display width & keep aspect ratio**
5. Full Height	= **fill display height & keep aspect ratio**
6. Letter Box	= **retain 16:9 aspect ratio**
Custom (not selectable)	= **non-preset values for** *Size, Vertical Stretch, H-Position, V-Position and/or Blanking*

WHAT IS THE RESIZING DEFAULT? By default when displaying a new source, your image will utilize as much of the projector's display area as possible for the type of incoming source data, but with minimal or no changes to aspect ratio. See *Select "Default"* on the following page.

WHEN "CUSTOM" APPEARS: The "Custom" re-size descriptor automatically appears in the *Geometry and Position* menu when any of the values for *Size, Vertical Stretch, H-Position, V-Position* or *Blanking* do not correspond to those for a preset. This option is not offered in the *Resize Presets* pull-down list.

- Select **"DEFAULT"** for most sources (factory default). The image will be centered and displayed as large as possible depending on the type of source.

- Select **"NO RESIZING"** to display the image in its native resolution, which may or may not match the projector's 1400 x 1050 resolution. For example, for a source with a native resolution of 800 x 600, "No Resizing" will use the central 800 x 600 pixels and have a black border—the black border areas are unused areas. See below.

- Select **"FULL SIZE"** to use all pixels (1400 x 1050) for displaying the image, regardless of source or original aspect ratio. Incoming source material having a different aspect ratio than the projector will be stretched for display.

- Select *"FULL WIDTH"* to fill the projector's display from left-to-right without changing the original aspect ratio of the image. Depending on the source, data at the top and bottom may be discarded (cropped), or the display may have black borders at the top and bottom (called "Letter Box").

- Select **"FULL HEIGHT"** to fill the display from top-to-bottom. Depending on the source, this may create borders.•

- Select **"LETTER BOX"** to display a Letter Box image in its native 16:9 aspect ratio. The image will fill the screen from side-to-side and be centered.

SIZE

"Size" controls both the image width and height in tandem, maintaining the current aspect ratio (proportion) of the displayed signal data.

VERTICAL STRETCH

"Vertical Stretch" adjusts the height of the image while keeping the width constant. Use "Vertical Stretch" to change the aspect ratio of the display.

PIXEL TRACK

Steady flickering or several soft vertical stripes or bands across the entire image indicates poor pixel tracking. Proper pixel tracking helps ensure that the image quality is consistent across the screen, that aspect ratio is maintained, and that pixel phase can be optimized (described below). Tracking determines the frequency of the pixel sampling clock, indicated by the number of incoming pixels per line, so that all pixels generated by a particular source are sampled.

NOTE: *By default, the projector samples at the correct frequency for most sources.*

For best results, use a good test pattern such as a smooth gray consisting of a clear pattern of black and white pixels, or a similar "half on, half off" graphic image, such as the *Windows* shutdown screen. Adjust the slidebar until the vertical stripes broaden to the point where one large stripe fills the image. If the image still exhibits some shimmer or noise, adjust *Pixel Phase* (next page).

PIXEL PHASE
NOTE: *Adjust "Pixel Phase" **after** "Pixel Tracking".*

Adjust pixel phase when the image (usually from an RGB source) still shows shimmer or "noise" after pixel tracking is optimized. Pixel phase adjusts the phase of the pixel sampling clock relative to the incoming signal.

For best results, use a good test pattern such as a smooth gray consisting of a clear pattern of black and white pixels, or a similar "half on, half off" graphic image, such as the *Windows* shutdown screen. Adjust the slidebar until the image stabilizes and each pixel is clearly defined. You may notice that you can stabilize the image at more than one point — i.e., you may find that the image appearance at "11" is identical to the image appearance at "38", thus you can use either setting.

If some shimmer from a video or HDTV source persists, use the "Filter" control to remove high-frequency noise from the signal. *See Picture Adjustments.*

H-POSITION
This option moves the image right or left within the area of available pixels.

NOTE: *The value shown represents where the approximate center of the image lies in relation to the total number of pixels available horizontally. This varies widely according to the signal — watch the image while adjusting.*

V-POSITION
This option moves the image up or down within the area of available pixels.

NOTE: *The value shown represents where the approximate center of the image lies in relation to the total number of pixels available vertically. This varies widely according to the signal — watch the image while adjusting.*

ADVANCED SIZE AND POSITION — SUBMENU
This submenu consists of the following options:

ACTIVE INPUT WINDOW: This read-only value indicates the current size (i.e., area) of your displayed data or "region of interest" as defined by the blanking controls. By default, the projector automatically determines what portion of its full resolution to use, and pixels in the surrounding borders are turned off. You can also specify a specific active input window size by adjusting one or more "Blank" settings. For example, if you have blanked (cropped) 100 pixels from both the left and right edges of an incoming source of 1400 x 1050, the remaining active input window will be reduced to 1200 x 1050. When using SD or HD or a decoded video source at **INPUT 3** or **INPUT 4**, the default blanking of "0" defines an active input window of 720 x 483.

Advanced Size & Position		
Active Input Window	720x483	
1. Top Blank	0	
2. Bottom Blank	0	
3. Left Blank	0	
4. Right Blank	0	
5. Plug & Display <EDID>🌐	Native Resolution 60Hz ▼	

BLANKING (TOP, BOTTOM, LEFT, and RIGHT): Crop the image as desired so that unwanted edges are removed from the display (changed to black—see right). Blanking defines the size of the *Active Input Window*, or area of interest. Range of adjustment depends on the source resolution and other factors. After adjustment of blanking it may be necessary to perform a source switch.

NOTE: *Blanking a PIP image resembles zoom (see Figure 3.14). For example, left Blanking zooms the right side of the PIP image; Right Blanking zooms the left side. There are no black bars.*
Figure 3.13. Blanking of a Primary Image
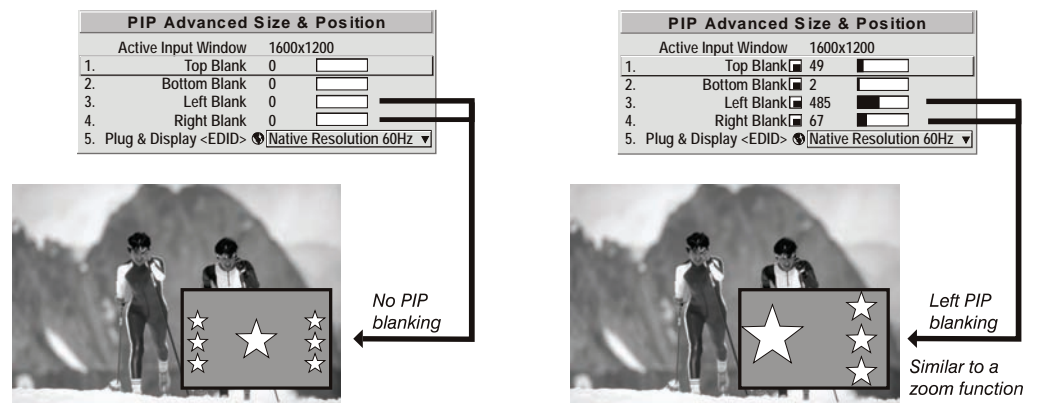

Figure 3.14. Blanking of a PIP Image

PLUG & DISPLAY (EDID): By default, a *Plug & Play (EDID)* source outputs a signal according to the EDID information provided by the projector. To override this information and display in a different format (for example, if your *Plug & Play [EDID]* device does not support the projector's resolution and/or frequency), select the desired *Plug & Play (EDID)* resolution from the list.

EDID = Extended Display Identification Data standard.

►1.	Native Resolution 60 Hz
2.	1400x1050 60 Hz
3.	720p (1280x720 60Hz)
4.	DC2K (2048x720 60Hz)
5.	1024x768x116Hz 3D
6.	1280x1024x110Hz 3D
7.	1400x1050x102Hz 3D
8.	1080p 60Hz / 1080i 60Hz
9.	1080p 50Hz / 1080i 50Hz
0.	1080p 24Hz / 1080i 30Hz

Picture Adjustments Menu

Use options in the *Picture Adjustments* menu to alter your image without affecting its size or position. Changes made to the *Picture Adjustments* menu are applied immediately and are saved when you exit the menu (press Exit or Menu). Options not available for the projector model or source are disabled and appear dim (gray).

Picture Adjustments			
1.	Contrast	50.0	▮▮▯
2.	Brightness	50.0	▮▮▯
3.	Gamma ⊕	2.2	▮▯▯
4.	Filter	Off	▼
5.	Detail	0	▯
6.	Noise Reduction	0	▯
7.	Color Space	YPbPr	▼
8.	Video Options		
9.	Input Levels		
0.	Advanced Image Settings		

CONTRAST
(***SHORT CUT:*** Press Contrast and adjust the slide bar.)

"Contrast" increases or decreases the perceived difference between light and dark areas of your image (0-100). For best results, keep it under 50. If contrast is set too high, the light parts of the image lose detail and clarity. If set too low, the light areas will not be as bright as they could be and the overall image will be dim. For best results, start with a low value and increase so that whites remain bright but are not distorted or tinted and that light areas do not become white (i.e., are "crushed").

NOTE: *If the environment lighting changes, an adjustment of* **Gamma** *is recommended (see below).*

BRIGHTNESS
(***SHORT CUT:*** Press Bright and adjust the slide bar.)

"Brightness" increases or decreases the amount of black in the image (0-100). For best results, keep close to 50. Start with a high value and decrease so that dark areas do not become black (i.e., are "crushed"). Conversely, high brightness changes black to dark gray, causing washed-out images.

GAMMA
(***SHORT CUT:*** Press Gamma and adjust the slide bar.)

"Gamma" is a global setting that determines what gray shades are displayed between minimum input (black) and maximum input (white) for all signals. A good gamma setting helps to optimize blacks and whites while ensuring smooth transitions for the "in-between" values utilized in other colors. Thus, unlike "Brightness" and "Contrast" controls, the overall tone of your images can be lightened or darkened without changing the extremes, and all images will be more vibrant while still showing good detail in dark areas.
Gamma is used to fine-tune the gamma table currently in use, ranging from 1 – 3 (2.2 = default). If excess ambient light washes out the image and it becomes difficult or impossible to see details in dark areas, lower the gamma setting to compensate. This will improve contrast while maintaining good details for blacks. Conversely, if the image is washed out and unnatural, with excessive detail in black areas, increase the setting. In high ambient light conditions, lower gamma may produce better results than higher gamma. Gamma of 2.6 (default) indicates the gamma table has not been adjusted. For more information, refer to *Advanced Image Settings* submenu, *Gamma Table*. Again, good gamma improves contrast while maintaining good details for blacks.

FILTER

The proper filter setting is automatically set for virtually all signals, and rarely needs to be changed. It applies a low pass filter for noise reduction in the incoming input signal, particularly for HDTV or SDTV. Applied in the analog domain before sampling, this filtering removes high frequencies and thus reduces pixel phase noise (note this also reduces signal bandwidth). Override only if standard pixel tracking and phase adjustments do not adequately clear up a "noisy" video signal, or if a graphics signal appears overly "soft". Both instances indicate that "Filter" may be set to the wrong option.

```
► 1. Off
  2. HDTV
  3. SDTV
```

DETAIL

"Detail" adjusts the sharpness of a video image so that edges remain clearly defined. It can be particularly useful if a significant "Noise Reduction" adjustment has caused the image to appear too soft. Adjust until the display is as sharp as desired, keeping in mind that because "Detail" adds some high frequencies back into the image, it can also re-introduce a certain degree of noise.

NOISE REDUCTION

"Noise Reduction" is similar to the "Filter" control, but operates in the post-sampling digital domain with a more subtle effect. Higher settings are most useful for clearing up noisy RGB images such as those from a PC. Adjust as desired, keeping in mind that reducing noise (which reduces high frequencies) may also soften the image.

COLOR SPACE

"Color Space" determines how the color components of an analog input signal are decoded for accurate color in the display. Selecting a color space option is useful only for analog signals connected to **INPUT 1, INPUT 2, INPUT 5** or **INPUT 6**. Although color space for these analog signals is automatically determined by the projector, in some circumstances you may wish to override this and manually set a specific color space.

```
► 1. RGB
  2. YPbPr (Video)
  3. YPbPr (HDTV)
```

NOTE: *For digital signals or for signals connected to* **INPUT 3** *or* **INPUT 4** *on the projector, the color space function is entirely automatic and the pull-down list disabled.*

The current color space appears in the *Picture Adjustments* menu. Press ⏎ to select a different option:

- Select **RGB** unless you are using component video at **INPUT 1, 2, 5** or **6**.
- Select **YPbPr (Video)** with a standard definition televised signal (SDTV)
- Select **YPbPr (HDTV)** with a high definition televised signal (HDTV).

NOTE: *When certain RGB signals are first connected, the projector may not initially recognize them as RGB and will incorrectly decode their color information as YPbPr (video). These signals can include:*

- *RGB signals in NTSC, PAL, SECAM frequency ranges*
- *Scan-doubled sync-on-green*
- *Scan-quadrupled sync-on-green*

For these signals, change the Color Space to RGB, and then define a new channel for future use.

VIDEO OPTIONS — SUBMENU

This submenu is used with video sources only **(INPUTS 3** or **4)**.

Video Options		
1.	Auto Color Level	☑
2.	Video Standard	Ⓐ? ▾
3.	Input Video Black	Enhanced 0 IRE ▾
4.	Color ⊕	50.0
5.	Tint	50.0
6. Chroma Luma Delay		35.0

AUTO COLOR LEVEL: Auto Color Level affects decoded video images only. Enter a checkmark (default) in most instances — this activates the Auto Color Level circuit to ensure properly bright images. Delete the checkmark if a decoded video image exhibits strange color artifacts such as stripes in highly saturated colors, indicating an incompatibility between this source and the Auto Color Level.

VIDEO STANDARD: For all but the more unusual video standards available in the world, the projector automatically detects the incoming horizontal and vertical frequencies and sets the projector's processing of this signal to the corresponding standard. The current video standard name appears in the *Video Options* submenu, and includes an "A" if it has been auto-detected. Press ↵ to view or select a different video standard from those available to the projector—any that are disabled have frequency characteristics that differ from those of the incoming signal. Selecting a specific standard forces the projector to process the signal according to this standard.

1.	Auto
2.	NTSC
▸ 3.	NTSC 4.43
4.	PAL
5.	PAL-M
6.	PAN-NC
7.	PAL-60
8.	SECAM

NOTE: *Best results are obtained with defined channels. Otherwise, switching from one video source to another can sometimes cause slight disturbances in the display, indicating that the Auto function is struggling. Recover by briefly selecting a different video standard, then going back.*

Table 3.4. Regions and Video Standards: Summary

Standard	Where Used (SUBJECT-TO-CHANGE)
NTSC	N. America and Japan
NTSC 4.43	A tape-only standard for partially-translated hybrid signals
PAL	Most of Europe, China, Australia, some of S. America, some of Africa
PAL-M	Brazil
PAL-NC	Argentina, Chile, other Latin American countries
PAL 60	
SECAM	France, Eastern Europe, most of Africa

NOTE: *Generally, use "Auto" for all instances EXCEPT:* **1)** *a poor quality input signal or* **2)** *a black-and-white video signal. In order to detect and display such signals, select the relevant standard from the list.*

INPUT VIDEO BLACK: This control compensates for incoming elevated black levels present in certain video signals, and ensures that blacks in the

If grays are black, select ⟶ ▸ 1. **Enhanced 0 IRE**
If blacks are gray, select ⟶ 2. **Video 7.5 IRE**

display are neither crushed (i.e., where dark grays appear black) nor excessively elevated (i.e., where blacks appear dark gray). By default, the projector automatically determines the best setting according to the type of incoming video signal:

• **ENHANCED 0 IRE** – Used for DVD output with "enhanced black", SECAM, most PAL standards, and Japanese NTSC.

• **Video 7.5 IRE** – Used for most NTSC video signals.

For some types of video, you can override the setting. The control is disabled for other types of video (and all graphics sources). Generally, if black appears crushed when brightness = 50, choose "Enhanced 0 IRE". If black appears excessively elevated, use "Video 7.5 IRE".

COLOR: This slidebar adjusts the Color Temp Adjust level, i.e. the *amount* of color in a video image. Lower settings produce less saturated colors — for example a setting of "0" produces a black and white image. If the color level is too high, colors will be overpowering and unrealistic.

TINT: This slidebar adjusts the red/green color hue for true color reproduction of video signals connected to INPUT 3 or 4 of the projector. For best results, adjust tint while displaying an external color bars test pattern — otherwise, it is recommended that tint remain at its default setting.

CHROMA LUMA DELAY: This control affects any incoming composite or S-video signal, delaying the luma signal (intensity) in relation to the chroma (color). In the image, increasing the luma delay will move luma (seen as a shadow where colors overlap) to the right slightly, with colors remaining in place. Decreasing this delay will move the shadow slightly to the left. If necessary for your current source, adjust so that no shadows occur with adjacent colors.

INPUT LEVELS — SUBMENU

NOTES: 1) *Because the projector automatically optimizes input levels for all but the most unusual of sources, it is recommended that only experienced users use the Input Levels submenu.* **2)** *Before beginning, check that overall contrast and brightness settings are near 50 **and** that color temperature is properly set up on an internal grayscale test pattern.* **3)** *There must be at least 2 consecutive white pixels present in the image for proper "Auto Input Level" function. Leave this control off after use.*

Input Levels	
1. Auto Input Level	☐
2. Red (Pr) Black Level	256
3. Red (Pr) White Level	256
4. Green (Y) Black Level	256
5. Green (Y) White Level	256
6. Blue (Pb) Black Level	256
7. Blue (Pb) White Level	256
8. Auto Color Enable	☑
9. Clamp Location	Back Porch ▼
0. Peak Detector	☑
Color Enable	White ▼

Turn OFF before leaving menu.

Levels adjust automatically and correctly.

NOTE: *Image must have at least **2** adjacent white pixels for "auto" to work.*

Good RGB or input levels — that is, the *drives* and *black levels* for each of the three colors, red, green and blue — ensure that images from analog sources other than decoded video have maximum contrast without crushing black or white. By default (and in a "Quick Setup"), the projector automatically determines the best input levels by monitoring image content and adjusting the controls appropriately — further adjustment is typically not required to obtain proper blacks or whites.

NOTE: *This automatic adjustment requires at least 6-12 consecutive white pixels in the image. Without these pixels, input levels may produce skewed colors, particularly in nonvideo images.*

However, for a very unusual source exhibiting one or more overly high blacklevels (typically caused by a noisy source causing blacklevel spikes), an experienced user may prefer to use the *Input Levels* menu (shown above). These adjustments, which together serve as a calibration process compensating for differences in sources and cabling, enable an experienced user to perfect the source image input levels and eliminate the "overshoot" and "undershoot". Note that *Input Levels* are of limited use with digital signals, but do offer some ability to tweak poorly mastered source materials.

NOTES: 1) *Input levels apply for the current source only, but for any color temperature used.* **2)** *Assuming that color temperature has been set up based on the internal test patterns, you can then set up input levels for a given source so that it matches the color temperature of the internal test patterns.*

AUTO INPUT LEVEL – Temporarily enter a checkmark *only* if you are an experienced user and you have an unusual source that you feel needs further color temperature and/or input level adjustment. This compensates for incoming out-of-range drives (white) and black levels (black) that would cause "crushing" of light and dark colors in the image. After entering a checkmark, wait for the six slide bar values to stabilize, then delete the checkmark and exit. The Auto Input Level is automatically turned off upon exit from the Input levels Menu.

BLACK LEVELS AND DRIVES - To check your image and adjust these controls:

1. Make sure overall "Contrast" and "Brightness" settings are both set to near 50. **NOTE:** *Not required for "Auto" adjustment.*

- $\overline{\text{Contrast}}$ = 50 (approx.)
- $\overline{\text{Bright}}$ = 50 (approx.)

2. Check the color temperature setup using an internal grayscale test pattern, making sure to obtain a neutral grayscale.

   NOTE: *Not required for "Auto" adjustment.*

3. Confirm that you are using an analog source not connected to INPUT 3 or INPUT 4, as Input Levels are not applicable for digital sources or sources going through the decoder. A grayscale is recommended.

4. If the blacks and/or whites appear OK, input levels do not need adjustment. If black levels are too high (and/or whites are too low, which is rare), you likely have a noisy source that is producing skewed input levels. Continue with Step 5.

5. Temporarily enable "Auto" in the Input Levels submenu. Wait for all 6 values to stabilize. Alternatively, do not use "Auto" — reduce blacklevels manually instead. Judge by eye and change one or more of the six levels as necessary to obtain proper blacks and whites. You may want to see only a certain color while adjusting — use the "Color Enable" option (described below).

6. Delete the "Auto" checkmark and leave the Input Levels menu.

IMPORTANT: Do not use Input Levels to adjust color temperature. This will distort Contrast and Brightness functions as well as color temperature.

AUTO COLOR ENABLE – When a checkmark is present, selecting a specific black level or drive to adjust will automatically enable the corresponding color in the display. Delete the checkmark to see all colors, or to enable a different specific color through the Color Enable Control.

CLAMP LOCATION – This option (formerly known as *sync tip clamping*) can brighten the image produced from certain high-resolution high-frequency graphic sources. The projector automatically selects the best

▸ 1. Back Porch
2. Front Porch

clamp location for almost all sources. Use the normal *Back Porch* location if the image is either sufficiently bright or overly bright. Select *Sync Tip* if the image appears unusually dim, if there are horizontal streaks across the image, or if there is significant color drift. This moves the clamping pulse from the normal back porch location (which is likely too short) to the tip of the horizontal sync pulse. *Tri Level* is typically needed for an HDTV source.

COLOR ENABLE – Select which color or colors you want to see in the display, useful while working with color temperature white levels or input levels.

NOTES: 1) *Input levels apply for the current source only, but for any color temperature used.* 2) *Assuming that color temperature has been set up based on the internal test patterns, you can then set up input levels for a given source so that it matches the color temperature of the internal test patterns.*

PEAK DETECTOR – The Peak Detector is a tool to assist with defining individual input levels, enabling you to accurately set the Input Levels for any particular source with the appropriate image. Enabling the Peak Detector activates a special operating mode for detecting *only* pixels that are considered black or white — all other levels are displayed as a mid-level gray. When used with a smooth grayscale pattern in which black and white are known to be at opposite edges of the image, you can watch these isolated areas while adjusting individual black levels and white levels until both black and white edges are *just* visible and distinguished from neighboring pixels. Images from this source will then display correct blacks and whites without crushing.

See Figure 3.15. ***Adjusting Input Levels Using the Peak Detector:***

1. Display a 16 level grayscale test pattern from the desired external source, and enter a checkmark in the Peak Detector checkbox. **NOTE:** *The "Peak Detector" will initially render the grayscale as a uniform gray field before adjustment.*

2. Display one primary color. **NOTE:** *Selecting Auto Color Enable ensures the correct color is displayed for each setting.*

3. For the current color, adjust its corresponding "Black Level" slide bar *just* until a single band of black appears at one edge of the screen. This band represents the first band of the grayscale pattern, which should be 100% black. Do not adjust too far.

4. With the same color still active, adjust its corresponding "White Level" slide bar *just* until a single band of color appears at the opposite edge of the screen. This band represents the last band of the grayscale pattern, which should be 100% white (or the current color, if a certain color is enabled). Do not adjust too far.

5. Go back and check the black band — adjust the black level slide bar if necessary. **NOTE:** *Readjusting the black levels affects the gain at this point; only readjust when absolutely necessary.*

6. Repeat Steps 3-5 with the other two remaining primary colors. When each primary color shows *one* optimized black band and white (or colored) band, the input levels for this source are correctly set. Upon exiting the *Input Levels* menu, the Peak Detector checkbox will clear.

	Input Levels	
1.	Auto Input Level	☐
2.	Red (Pr) Black Level	256
3.	Red (Pr) White Level	256
4.	Green (Y) Black Level	256
5.	Green (Y) White Level	256
6.	Blue (Pb) Black Level	256
7.	Blue (Pb) White Level	256
8.	Auto Color Enable	☑
9.	Clamp Location	Back Porch ▾
0.	Peak Detector	☑
	Color Enable	Red ▾

3. Adjust corresponding blacklevel (red, green, or blue) until one **black** band appears.

4. Adjust corresponding input drive (red, green, or blue) until one **bright** band appears.

2. Choose one primary color at a time.

Figure 3.15. Adjusting Input Levels Using the Peak Detector (RED EXAMPLE SHOWN)

ADVANCED IMAGE SETTINGS — SUBMENU

Use the *Advanced Image Settings* submenu to make the adjustments necessary for lesser-used but more specialized applications on your projector.

GAMMA TABLE — This control applies a default *video, graphics* or *simple* gamma table or "curve" to your images, controlling the intensity of mid-level colors and producing maximum contrast, brightness and color performance. As shown at right, the graphics curve is a modified power curve that will show more detail in darker areas of the projected content while the video curve has a linear segment near black to compensate for increased black levels typical of video signals. A simple gamma curve is a true power curve that does not alter the contrast or the intensity of mid-level colors.

Keep in mind that any *Gamma Table* choice sets the related *Gamma* value (shown in the *Picture Adjustments* menu) to a 2.6 default, where it can be fine-tuned as desired. Different values (1-3) here indicate that the original gamma table has been adjusted with either the Gamma slide bar or direct key.

Advanced Image Settings	
1. Gamma Table 🌐	Graphics ▼

6. Film 2
7. Fluorescent
8. Incandescent
9. Sunlight
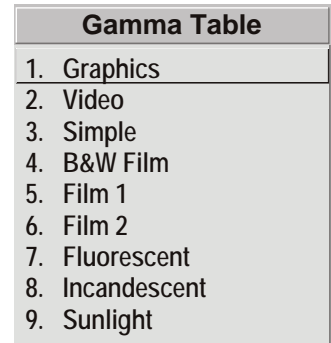

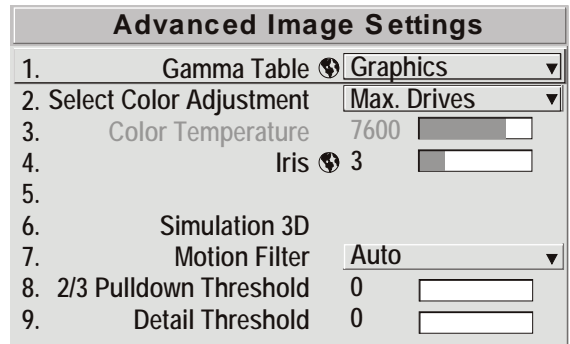

SELECT COLOR ADJUSTMENT — In "Select Color Adjustment", choose an overall color performance for all images. The "Max Drives" factory default simply drives all 3 colors at their maximum level so that they are fully on and cannot be changed. The two other pre-defined color adjustment choices — *SD Video* and *HD Video* — apply a color gamut optimized for video sources (standard or high-definition). Alternatively, you can specify a color temperature, which enables the nearby Color Temperature slidebar and applies its current setting (default = 6500K). If none of the pre-defined "Select Color Adjustment" options or color temperatures suit your application, select one of four color gamuts previously defined by a user (User 1, 2, 3, 4). A "User" option applies a customized color performance in which the user has precisely set the hue and intensity of each color component in the *Color Adjustment by X/Y* or *Color Temp Adjust* submenus, and is most often needed with multiple-projector applications. Select the color adjustment producing the best color accuracy for your application and installation.

1. Max. Drives
2. Color Temperature
► 3. SD Video
4. HD Video
5. User 1
6. User 2
7. User 3
8. User 4
To configure a "User" color adjustment (gamut), use either the *Color Adjustment by X/Y* or *Color Temp Adjust* submenu found in the *Display Setup* menu under Geometry and Color.

NOTES: 1) *"Color Temperature" defaults to 6500K until changed. All four "User" options default to SD Video unless the user has redefined them.* **2)** *Factory-defined color primaries, which ensure consistent color gamut from projector-to-projector, can be calibrated in the* **Service** *menu only. If you suspect alteration, the factory settings can be recovered with selection of "**Reset to Factory Defaults?**" in the* **Color Primary Settings** *submenu within the* **Service** *menu (password-protected).*

COLOR TEMPERATURE — Adjust to apply a specific and accurate color temperature to all displays. Color temperatures are expressed in degrees Kelvin (3200-9300K), and utilize different combinations of the projector's original native color primaries to produce a "coloration" or cast (reddish or bluish) in images—the lower the temperature, the more reddish the cast; the higher the temperature, the more bluish the cast. Note that the slide bar is enabled only if you have a source connected and have selected "Color Temperature" in the adjacent "Select Color Adjustment" pull-down list in the *Advanced Image Settings* menu.

IRIS - The IRIS inside the projector controls the diameter of the light beam passing through the system. With a fully open aperture (slide bar default of "0"), the maximum amount of light passes through for maximum brightness in your images. Increase the slide bar setting to reduce the aperture diameter and maximize contrast ratio instead. Performance of aperture depends on the lens in use.

NOTE: *IRIS* *also appears in the lamp menu.*

SIMULATION 3D — SUBMENU OF ADVANCED IMAGE SETTINGS

Use the options in the *Simulation 3D* menu to make the timing adjustments necessary for realistic simulation and 3D images.

FRAME DELAY MONITOR — This slide bar monitors the latency between input and output. For best results, the bar width and value should remain fairly constant, indicating that timing of input and output frames is locked; the Frame Delay Monitor value should stay within 5-10 lines or so of the Frame Delay setting. If a frame is lost or "dropped", the bar will move suddenly and the values will change, indicating that the frame input is no longer equal to the output.

Simulation 3D		
Frame Delay Monitor	1047	
1. Frame Delay	1000	�
2.		
3.		
4.		
5.		
6. Frame Lock Enable	Locked ▼	

FRAME DELAY — Set the number of lines delayed between the input signal and its appearance on screen, keeping in mind that projector processing always *adds one frame of delay* to the frame delay setting. For applications such as simulation, where the feeling of "real time" image response is a priority, a minimum setting is usually preferable. For projectors capable of 3D (stereographic) applications where alternating left-right frames must be synchronized with the corresponding L/R shutters in 3D glasses, a total frame delay setting of two (or multiple of two) may be more useful. If set too high or low, frame locking will not be possible — most sources require approximately 50 lines of delay to ensure frame locking.

FRAME LOCK ENABLE — This option allows the projector to control the output frame timing based on the input signal. The locked option forces (if possible) the output image to be phase locked to the input frames. Rate Matched means that the output runs at close to the input frequency but isn't locked to it so the output will drift in phase relative to the output. Free Run forces the output to run at a 60Hz frame rate.

▸ 1. Locked
2. Rate Matched
3. Free Run

ADVANCED IMAGE SETTINGS - SUBMENU (CONTINUED)

MOTION FILTER — This control is most useful for smoothing out moving images from interlaced sources. In most cases the proper Motion Filter setting is automatically determined according to the type of incoming source signal. However, if your source is jittery and/or tearing you may wish to "force" a setting to ensure stable processing for this source—if desired, override the default "Auto" setting by selecting the appropriate motion filter:

```
  1.  Auto
► 2.  Still
  3.  Motion
  4.  Film
```

1. **AUTO:** The projector will automatically use the correct motion filter according to the incoming signal.

2. **STILL:** For static images with no motion, such as graphics from a CD.

3. **MOTION:** For video images that did not originate from film, or for moving computer-generated images.

4. **FILM:** For video images that originated from film. This will optimize image quality and stability.

2/3 PULLDOWN THRESHOLD — This setting determines how sensitively the projector can detect if an incoming video signal originated from film or not.

DETAIL THRESHOLD — Use "Detail Threshold" to define at what frequency level the "Detail" control will begin to magnify high frequencies, which adds details back into the image. Raise the threshold to ignore more of these high frequencies, and lower the threshold to magnify more of these frequencies. A setting of "0", for example, means no noise will be ignored and all will be magnified. An ideal detail threshold is one in which high frequencies that are causing objectionable noise are not magnified when using "Detail", but frequencies which can help sharpen an overly-soft image are magnified.

3.6 Adjusting System Parameters and Advanced Controls

Use the *Display Setup* menu to define general operating parameters and communications with other projectors and equipment, and to access other advanced processing and image adjustments affecting overall performance. In addition, the *Display Setup* menu provides access to diagnostics, calibration tools and the Service submenu (password-protected).

Display Setup		
1.	Language 🌐	English ▼
2.	Image Orientation 🌐	Front ▼
3.		
4.	Auto Power Up 🌐	☐
5.	Set Date and Time	
6.	Menu Preferences	
7.	Communications	
8.	Geometry and Color	
9.	Diagnostics and Calibration	
0.	Service	
Option Card 1 : Dual HDSDI Input		
Keep in mind that settings in the *Display Setup* menu (and its submenus) are typically "global" settings applied regardless of the type of source being used. This characteristic is identified with the (globe) icon alongside the option. The first six options in the *Display Setup* menu are explained below:

NOTE: *The **Display Setup** menu is recommended for experienced users/technicians only.*

System Configuration — GENERAL —

The first six options in the *Display Setup* menu are explained below:

LANGUAGE
Choose from available languages to use in the projector's menus. The change will take effect immediately.

IMAGE ORIENTATION
Set the orientation of the image according to the orientation of your projector. If the setting is incorrect, projected images will be reversed and/or upside down.

AUTO POWER-UP
Enter a checkmark to enable the projector to automatically power up after losing power due to a power failure or due to unplugging the projector during operation. Wolf Cinema recommends that this be left unchecked, as a power loss in an unattended house will result in the projector turning on without anyone realizing it is on. Note that unsaved display adjustments may be lost.

SET DATE & TIME
Enter/read the current year-month-day and hour-minute-second. Changes here reset the projector's real-time clock.

MENU PREFERENCES — SUBMENU
Use the options in this submenu to adjust the appearance, content and/or location of on-screen menus and messages.

Menu Preferences		
1.	Large Menu Font ⊕	☑
2.	Menu Location ⊕	4:3 Top/Left ▼
3.	Horizontal Shift ⊕	261 ▭
4.	Vertical Shift ⊕	204 ▭
5.	Display Channel List ⊕	☐
6.	Display Bar Scale ⊕	☐
7.	Display Error Messages ⊕	All ▼
8.	Splash Screen Setup	Always On ▼

LARGE MENU FONT — Enter a checkmark to enlarge menus and their text. You may have to adjust "Menu Location" to accommodate the increased menu area.

MENU LOCATION — Use the pull-down list to choose a pre-defined default or customized location for the display of all on-screen menus.

To create a custom menu location quickly, choose a preset that is closest to the desired location. Then adjust "Horizontal Shift" and "Vertical Shift" slidebars to move the menu to the desired location. Avoid locations too close to a corner or edge to prevent cropping of larger menus.

HORIZONTAL SHIFT AND VERTICAL SHIFT — Shift your menus as desired, creating a customized menu location.

DISPLAY CHANNEL LIST — Enter a checkmark if you want to see a scrollable channel list whenever you press (Channel) from your presentation. Channels marked with a list icon in the Channel Setup menu will appear here. The "Display Channel List" option also enables on-screen feedback when using the (Channel) key. If you prefer to hide the channel list and input dialog box while switching channels and sources during a presentation, clear the checkbox.

NOTE: *The Channel List and input dialog box cannot be hidden during use of the menus.*

DISPLAY SLIDEBARS — Enter a checkmark to superimpose a small slidebar over the current image whenever an adjustable parameter is selected directly with a key such as (Contrast) or (Bright). If "Display Slidebars" is unchecked, these slidebars can still be accessed, but will be hidden during adjustment. This option does not affect slidebars in menus.

DISPLAY ERROR MESSAGES — Choose how you want to be notified of errors detected in either the incoming signal or projector. Select "Screen" or "All" (default) to see brief on-screen messages. This is particularly recommended during setup or testing of the projector. Or select "Serial Ports" to receive messages via RS232 or RS422 serial communication only. To hide error message displays, such as during shows and presentations, select "Off" or "Serial Ports".

System Configuration
— COMMUNICATIONS —

Settings in the Communications submenu define and control how single or multiple projectors are linked with each other and with a controlling device.

```
                    Communications
 1. Baud Rate for RS232   🌐 │115200        ▼│
 2. Baud Rate for RS422   🌐 │115200        ▼│
 3.            Projector   🌐  004
 4.      Network Routing   🌐 │All Joined      ▼│
 5.      Ethernet Settings
 6.        Broadcast Key   🌐 □
 7.            Backlight   🌐 □
 8.             Front IR   🌐 │On            ▼│
 9.              Back IR   🌐 │On            ▼│
10. Wired Keypad Protocol     │Any           ▼│
```

BAUD RATES
The baud rate setting determines the speed of communication to and from the projector on the RS232 or RS422 links. The maximum rate for the RS232 is 115200; for RS422 it is 19200. Set the baud rate to match that of your controlling device, such as your PC. If you are unsure about what baud rate to choose, refer to the documentation for the controlling device. In an existing network of projectors, if you discover that a projector has a different baud rate, use the pull-down list and select the correct baud rate using the ⏎ key — do not just scroll this control with ◄ or ► keys. Serial communication is always eight data bits, no parity.

PROJECTOR
Enter a three-digit number (such as "001") to assign or change a number to the projector currently in use. If the current projector already has a number assigned, that number will appear here (for example, "004" in the menu shown above). Numerical identity for projectors enables you to communicate with a single projector within a multiple-projector application (see also ⬭Proj key in **3.2, Using the Keypads**). If you make a mistake in assigning or changing the projector number, press ⬭Exit to cancel.

NOTE: *When multiple projectors are being used and you want to adjust the color and edge blending settings for individual projectors to create one seamless image, you must assign different numbers for each projector to allow switching back and forth between projectors while adjustments are being made.*

NETWORK ROUTING
NOTE: *Not applicable for stand-alone projectors or simple serial networks with only one type of controller and linking.*

```
 ▶ 1.  Separate                  = Networks do not communicate with one another
   2.  RS232 and RS422 joined    = Serial networks are joined, but Ethernet is isolated
   3.  RS232 and Ethernet joined = RS232 and Ethernet are joined but RS422 is isolated
   4.  All joined                = Network communications travel all networks
```

SEPARATE: Select "Separate" (factory default) to keep RS232, RS422 and Ethernet messages on their respective paths instead of being broadcast to the other types of ports.

RS232 AND RS422 JOINED: Messages originating from an RS232 or RS422 controller will be relayed to all RS232or RS422 ports. Any Ethernet communication, however, will not.

RS232 AND ETHERNET JOINED: Messages to and from the RS232 ports will also be relayed to the Ethernet port, and vice versa. Any RS422 communications will be isolated.

ALL JOINED: All messages reach all ports, regardless of type.

ETHERNET SETTINGS - SUBMENU

NOTE: *Recommended for network administrators only.*

DHCP: Enable this checkbox if you want a DHCP server to automatically change the projector's default IP address (0.0.0.0) to one that is valid and unique for use on the current Ethernet network. On networks without a DHCP server, or to simply override the automatic DHCP server function, delete the checkmark and enter the new "IP Address" settings desired. Remember that only a 0.0.0.0 address will trigger the DHCP addressing service, and only when the DHCP checkbox is enabled.

Ethernet Settings		
1.	DHCP Enabled	☑
2.	IP Address	000.000.000.000
3.	Port	3002
4.	Subnet Mask	000.000.000.000
5.	Default Gateway	000.000.000.000
6.	Network Name	[ ]

☑ = *Projector's IP address will be DHCP-assigned*
☐ = *Use static address assigned in "IP Address"*

IP ADDRESS: Enter a valid and unique IP address for use on the network to which the projector is currently connected. This address will overwrite any previous IP address such as the projector's factory-defined default (0.0.0.0), or one that has been assigned by a DHCP server or other user. It takes approximately 10 seconds for the projector to respond at its new address.

PORT: On some Ethernet networks, firewall restrictions may require that the port number of the projector be changed from its default of 3002. If so, enter a new valid port number here. It is highly recommended not to use a port # below 1000, as these ports are typically reserved for and used by common IP applications.

SUBNET MASK AND DEFAULT GATEWAY: The Subnet Mask and Default Gateway are automatically assigned when DHCP is enabled. If a static IP is being used, the IP must be assigned first since the projector estimates the subnet mask after the IP is entered. The Default Gateway is an optional router device used to send and receive data outside the subnet.

NETWORK NAME: Set the name for the projector, as it should appear on the local network. The control is most useful when DHCP is enabled, since the IP address may change from one session to another.

BROADCAST KEY
Enter a checkmark if you want keypad commands sent to one projector to be relayed to all projectors in a serial network. Note that the key will temporarily "override" the effect of a broadcast setting and allow you to control a specific projector when necessary. Disable the setting for all but one (any) projector in a network.

BACKLIGHT
Toggle the built-in keypad lighting on/off.

FRONT IR / BACK IR
As needed for your application, set to "any" so that the front and/or rear IR sensor locations on the projector respond to the IR keypad. Set to "off" to disable.

To disable both IR sensors, you cannot use the IR remote keypad to select the second OFF setting. This safeguard prevents accidentally disabling an IR keypad while you are using it. Instead, use either the built-in keypad or a wired remote (optional) to set the remaining active sensor to OFF. The projector will no longer respond to an IR remote keypad.

NOTE: *Protocols **B – G** are used for rental staging applications.*

System Configuration
— GEOMETRY & COLOR —

In the *Display Setup* menu, select the *Geometry and Color* submenu when you need to modify overall color performance and/or image geometry for all sources.

Geometry and Color		
1.	Test Pattern	Grid ▼
2.	Keystone ☯	50.0 ▭
3.	White Field Uniformity	
4.	Edge Blending	
5.	Color Adjustments by X,Y	
6.	Color Temp Adjust	
7.	Black Edge Blending	
8.	Default Color Adjustment ☯	▭
9.	Lens VariScope (LVS) ☯	☐

☯ Keystone and Warping if Wolf Cinema warping module is present (standard in Wolf Cinema models, optional in all others).

TEST PATTERN
Choose the desired internal test pattern or select OFF to turn off a test pattern. Alternatively, use the (Test) key for cycling through test patterns.

KEYSTONE *(Not recommended to use Keystone on Wolf WARP pictures)*
Use to correct a keystoned image shape in which both sides of your image are inclined toward the top or bottom edge. Keystone is typically caused by tilting the projector in relation to the screen, so that the lens surface and screen are no longer parallel to each other.

Figure 3.16. Keystone Adjustment

NOTE: *Wolf Cinema recommends that the keystone feature not be used unless absolutely necessary, as it may cause some artifacting in the image.*

WHITE FIELD UNIFORMITY — SUBMENU
Corrects for shadows caused by short throw or anamorphic lenses.

EDGE BLENDING — SUBMENU
The *Edge Blending* submenu provides a range of controls for smoothing together the overlapping bright edges of multiple adjacent projected images to create a single larger "seamless" image. These controls, which primarily affect white levels, are typically used in conjunction with mechanical lens blinders (optional), which are installed on the front of the projector and which primarily affect black levels. There is a centerline (both horizontal and vertical) in the Edge Blending test pattern. The intersection of these lines is the true center of the projector's display area.

NOTE: 1) There is a centerline (both horizontal and vertical) in the Edge Blending test pattern. The intersection of these lines is the true center of the projector's display area.

COLOR ADJUSTMENTS BY X/Y AND COLOR TEMP ADJUST — SUBMENUS
NOTES: 1) *For defining or changing a User 1, 2, 3, or 4 color performance or "gamut". Sometimes known as Comprehensive Color Adjustment™.* 2) *Factory-defined primary color levels, which ensure a specific color performance from projector-to-projector, can be calibrated in the Service menu only. If you suspect alteration of these defaults, the factory settings can be recovered with selection of "**Reset to Factory Defaults**?" in the **Color Primary Settings** submenu accessed via the Service menu (password-protected).*

From the factory, the projector can utilize any of the three pre-defined color performance settings identified at right (default=Max Drives), or colors can be driven on the basis of color temperature. For most applications, one of these gamuts will produce accurate and realistic colors from a variety of sources. They can be applied at any time in the *Advanced Image Settings* menu ("Select Color Adjustment"), and are not adjustable.

Pre-defined

▶ 1. Max. Drives
2. Color Temperature   **Slidebar**
3. SD Video
4. HD Video
5. User 1
6. User 2
7. User 3
8. User 4

Adjustable
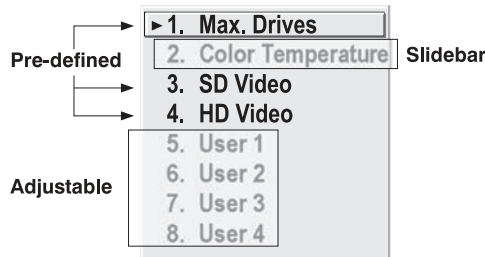

DEFINING "USER" COLOR GAMUTS: In some cases, you may find that none of the pre-defined "Select Color Adjustment" options exactly suit your needs. For example, you may require a unique color gamut (range) for a single projector or application, or you may need to precisely match colors across multiple adjacent displays. In such cases, use the *Color Adjustments by X,Y or Color Temp Adjust* submenu to define the precise hue of each primary color component (red, green, blue, and white) used to generate the millions of colors produced in displays. You can create up to four custom color gamuts (User 1, 2, 3, or 4) with these adjustments.

Note that the two menus differ only in their user interface, so use whichever menu best suits your needs and application. A color meter can help with adjustments.

• *Color Adjustments by X,Y* — Enter known x/y coordinates from the chromaticity graph.

• *Color Temperature Adjustment* — Adjust color slide bars and judge image color by eye or meter.

A user-defined color "adjustment" can be applied by selecting it in the *Advanced Image Settings* menu ("Select Color Adjustment").

COLOR ADJUSTMENT BY X,Y: Use this submenu if you want to create, alter or copy a color gamut (i.e., "color adjustment"). Controls in this menu define the precise hue of each primary color component (red, green, blue, and white) used to generate the millions of colors produced in displays. The x/y coordinates for each color define its location on the standard CIE chromaticity graph (see Figure 3.17)—changing either or both of these numbers will change the hue of the color, and relocate the "triangle" for possible colors. For example, changing the x/y coordinates for red may move the color closer to orange or closer to violet, which will in turn affect all displayed colors having a red component. Adjust the slide bars or enter new specific coordinates as desired to define or change up to four "User" color gamuts needed for your environment and applications. Apply at any time in the *Advanced Image Settings* menu.

Color Adjustments by X,Y		
1. Select Color Adjustment	User2	
2. Color Temperature	6521	▭
3. Red X	0.655	▭
4. Red Y	0.341	▭
5. Green X	0.332	▭
6. Green Y	0.575	▭
7. Blue X	0.144	▭
8. Blue Y	0.093	▭
9. White X	0.320	▭
0. White Y	0.330	▭
Auto Color Enable	☑	
Color Enable	Red ▼	
Copy From	Max Drives ▼	
Figure 3.17. Chromaticity Diagram (without Yellow Notch Filter)

NOTE: *Keep new x,y coordinates within the original color gamut triangle shown here.*

COLOR TEMP ADJUST: Use this submenu if you do not have specific color coordinates in mind and will simply judge color performance by meter. Like the *Color Adjustment by X,Y* submenu, each color control actually defines new x/y coordinates for that color and changes its hue — it is just a different interface.

Adjust the hue of each primary color (red, green, blue, and white) by using more or less of it in relation to the other colors.

Color Temp Adjust		
1. Select Color Adjustment	User 4	
2. Color Temperature	6521	
3. Red Color Adjustment		
4. Green Color Adjustment		
5. Blue Color Adjustment		
6. White Color Adjustment		
7. Auto Color Enable	☐	
8. Color Enable	White ▾	
9. Copy From	Color Temperature ▾	
0. Lamp		

NOTE: *A **Color Temp Adjust** adjustment defines the corresponding x/y coordinates shown in the **Color Adjustment by X,Y** submenu. These x/y coordinates will remain stable for this User gamut until they are changed again via either menu. Values displayed in the **Color Temp Adjust** menu, however, will likely fluctuate as you use the projector, and will be different when you return to this menu at some point in the future. These floating changes do not affect the x/y coordinates or gamut.*

BLACK EDGE BLENDING — SUBMENU
Black Edge Blending is a feature that eliminates the differences between black levels when edge blending multiple projectors. The *Black Edge Blending* submenu provides many controls to allow the edges of adjacent images to be smoothly overlapped creating a "seamless" image. Edge blending smoothes white levels, and if edge blending is not in use, Black Edge Blending is disabled. Black Edge Blending provides a simple solution for uneven black levels, without the need for external hardware, by matching up black level hues with a "target area" hue (the intersection of the center lines), and adjusting the overlaps (edges) surrounding the target area.

NOTES: 1) *There is a centerline (both horizontal and vertical) in the Black Edge Blending test pattern. The intersection of these lines is the true center of the projector's display area.* **2)** *Adjust white levels before adjusting black levels.* **3)** *Blinders are recommended for fixed installations.*

DEFAULT COLOR ADJUSTMENTS — SUBMENU
Refer to **System Configuration – Geometry and Color, Color Adjustments by X,Y** for description.

LENS VARISCOPE™ (LVS™) — SUBMENU
LVS™ provides the ability to recall focus and zoom settings specific to each source input. Custom lens settings you've chosen for any source will be quickly and accurately applied when you select a source that has already been calibrated. Place a checkmark in the checkbox to enable LVS™. If no calibration has previously been done you may be prompted to do a full calibration. If a motion calibration has been done, you will be prompted to complete a reference calibration. If both calibrations have been done, the checkbox will be checked and LVS™ enabled. If LVS™ is enabled, a reference calibration will be done on power up and the lens will return to the saved position of the source that is active at the time of power up or to the position the lens was located when it was powered on. Further adjustments to the zoom, focus and position will be automatically saved for source the selected source. If you switch to a source with different lens settings and switch back, the lens will automatically move to your saved settings upon return. Other sources can be used without using LVS™ .

NOTES: 1) *See **System Configuration – Diagnostics/Calibration, LVS Calibration** for further details about calibration.* **2)** *LVS™ control is a preference setting and will be retained between power cycles.*

System Configuration
DIAGNOSTICS/CALIBRATION

TEST PATTERN
Choose the desired internal test pattern to display, or select OFF to turn off a test pattern. Alternatively, use the ⬭Test⬮ key for cycling through test patterns.

NOTE: *There is a centerline (both horizontal and vertical) in the Edge Blending test pattern. The intersection of these lines is the true center of the projector's display area.*

TEST PATTERN GREY LEVEL
Set the desired level of grey for displaying in the full gray field test pattern.

FREEZE IMAGE
Enter a check mark to freeze (stop) an image on a single frame. This diagnostic tool is useful if you need to examine in detail a still version of an incoming image that cannot be "frozen" at the source. For example, in moving images it is sometimes difficult to observe artifacts such as external de-interlacing/resizing and signal noise. Remove the checkmark to return back to normal.

COLOR ENABLE
Select which color or colors you want to see. This is useful while working with color temperature, input levels or other special setup parameters. Colors can also be enabled/disabled by entering the corresponding function code listed on the back of the standard remote keypad.

ODD PIXEL ADJUSTMENT
NOTES: 1) *Factory-set and rarely required by user.* **2)** *Source must be >90 MHz.*

When using certain RGB sources, you may need to adjust the normal gain or offset of odd pixels in relation to even pixels. This will smooth out very narrow (one-pixel wide) "checks" or vertical stripes that indicate adjacent "on" and "off" pixels. Using the Level Detector simplifies this process (see Figure 3.18):

1. Use an external analog native-sized continuous grayscale test pattern with at least 256-levels.

2. Turn "Level Detector" on.

3. Set "Level Value" to *~200*. The image should now be black-and-white (or black-and-one color, if you use "Color Enable" function).

4. Adjust *offset*. Half of the pixels will move, the other half will not.

5. Adjust until the two transition regions overlap. The stripe of noise will be minimized, defined by the value in the slide bar.

6. Set "Level Value" to *~800*. The image should now be black-and-white.

7. Repeat Steps 4 and 5, but adjusting *gain*.

8. Repeat Steps 3-7 for all remaining colors. Your RGB source should now be OK.

Two sets of values are automatically saved with these controls — one value for Input #1, and one for Input #2 (analog). The current set of values depends on which source is in use. This enables a source to be processed correctly via two different inputs.

Figure 3.18. Using "Odd Pixel Adjustment"

NOTES: 1) *Adjust offset before gain, since offset affects gain.* **2)** *A value of 128 represents no change in normal odd pixel offset or gain.* **3)** *Odd Pixel Adjustment eliminates "one pixel on, one pixel off" artifact only, not any type of larger artifacts.*

RESERVED
No function.

PEAK DETECTOR
The "Peak Detector" is a fast method for defining individual input levels, and can improve the accuracy of input levels set by the Auto Input Level function. Enabling the "Peak Detector" activates a special operating mode for detecting only pixels that are considered black or white — all other levels are displayed as a mid-level gray. When used with a 16-step grayscale pattern in which the two black and white bands are known to be at opposite edges of the image, you can watch these isolated areas while adjusting individual black levels and white levels until both bands are just visible. Images from this source will then display correct blacks and whites without crushing or washing out.

NOTE: *If using Peak Detector with PIP, both images must have the same color space.*

LEVEL DETECTOR
The "Level Detector" checkbox enables specific thresholds for blacks and whites — input levels that fall below a specified *Level Value* (see below) are displayed as black, and all others are displayed as white. It aids in Odd Pixel Adjustment. To use:

1. Enable "Level Detector" and display a continuous grayscale.

2. Set "Level Value" to near black (such as 200).

3. Adjust Offsets to minimize area of black stripe.

4. Set "Level Value" to near white (such as 800).

5. Adjust Gains to minimize area of white stripe.

LEVEL VALUE
Level Value defines the value to be used by the Level Detector in recognizing blacks and whites. See *Level Detector*, above.

ASPECT RATIO OVERLAY
Selecting this option with a checkmark will overlay a number of common aspect ratio boxes on top of the source image. This is very helpful during the setup of the projector and can be turned off after desired specifications have been achieved.

LAMP TRACKING CALIBRATION
NOTES: 1) *Lamp Tracking Calibration takes up to two minutes.* **2)** *For best results, allow the projector to warm up for 15 minutes prior to calibration.*

Lamp Tracking Calibration defines the range of power needed to maintain lamp brightness. Select Calibrate Lamp Tracking for calibration using your projector's unique specifications (recommended) rather than standard specifications. The projector will revert to the default back-up in the event of a power failure.

LENS VARISCOPE SYSTEM (LVS™) CALIBRATION
This option allows you to choose between three types of lens calibrations. **Reference** calibration determines a reference point that is used as a defined starting position for relative motion of the lens. All positioning is measured from this reference point. A reference calibration is lost when power is removed from the projector and will occur on every power up as long as LVS™ is enabled. A **Motion** calibration determines the characteristics of each motor and values are saved in the projector's memory. If LVS™ is enabled and a motion calibration has previously been done, the projector will automatically recall these settings from memory when it's being powered up and a motion calibration will not take place. A **Full** calibration performs both a reference and motion calibration.

AUTOMATIC LVS LENS CALIBRATION
When this option is selected (default) and the projector is in LVS mode, the projector will perform a lens calibration on each power-up. During calibration, the shutter will be closed and the status LED will display 'LC'. If LVS is not selected, the ALC setting will be ignored. If, during power-up, ALC is not selected and LVS is, the last stored location from the previous LVS calibration will be assumed to be true and the lens will moved to that position upon power-up if necessary.

NOTE: *It is recommended to leave this feature disabled.*

System Configuration
OPTIONAL INPUT MODULES

The two "Option Card" entries In the *Display Setup* menu identify which optional input modules (a.k.a. cards) are present at **INPUT 5** (Option 1) and **INPUT 6** (Option 2). If either of these option slots is empty, the corresponding read-only menu entry does nothing. If there is a module installed, the corresponding menu entry may activate a submenu of further options pertaining to that module.

For example, if the *Dual SD/HD-SDI* module is installed at **INPUT 5** (Option 1). The Option 1 Card submenu provides controls for configuring the various connections on this multi-input, multi-output module. As desired for your application, you can define **1)** which physical input loops through to which output, and **2)** which functional input (main or PIP signal) loops through to which output.

System Configuration
CONFIGURE CHANNELS
- SUBMENU

Select Automatic mode or a series of manual modes. In Automatic mode the input video payload information is read and compared to that of the SMPTE 352 standard to detect the dual link format and the primary channel. Single video input will also work in this mode without any payload information. Dual link input video which does not contain payload information must be set up manually. Select the format and which of the two channels is the primary input.

Option Card 1: Dual SD/HD-SDI Module
1. Loop Thru Output Selection 🌐 Input A to C, Input B to D ▼
2. Configure Channels 🌐 Automatic ▼

► 1. Input A to C, Input B to D
2. Input A to D, Input B to C
3. Main to C, PIP to D
4. Main to D, PIP to C
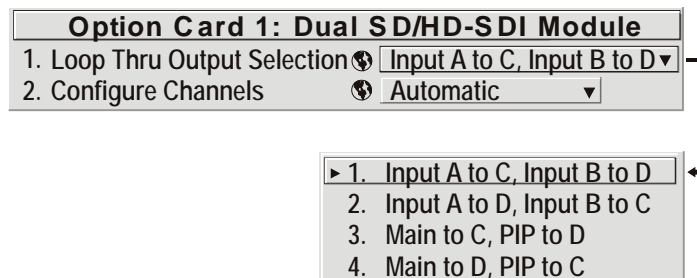

3.7 Working with PIP or Seamless Switching

PIP (Picture-in-Picture) and Seamless Switching are independent but related projector features that both utilize two image-processing paths within the projector. In the case of Picture-in-Picture, this double processing enables you to display two different images simultaneously – typically a smaller "secondary" image within a large "primary" background. In a seamless switch, the double processing essentially occurs between displays so that a full image relayed from one source can smoothly transform into a full image from another source. This change can be virtually instantaneous, or slowed as desired so that the current image appears to dissolve or "fade" into the new image.

Options for enabling and controlling PIP and Seamless Switching all reside in the same menu. Note, however, that because both features utilize the projector's double processing capability, PIP and Seamless Switching cannot be used together. For example, fading a pair of PIP images into a new display from a different source is not possible.

For best PIP or Seamless Switching results, use two *different* signal types* as defined below. Do not mix two signals of the same type.

Table 3.5. Signal Type

Signal Type	Description (Input Location)
#1	5 BNCs (RGBHV or YPbPr)
#2	DVI - I (analog or digital)
#3	Decoded signals (Input 3, Input 4, Composite video, S-Video, or any video signal via Input 1 BNC connectors or via an analog option card).
#4	Analog Option Cards
#5	Digital Option Cards
#6	Digital Option Cards

* HD interlaced sources are not recommended for the PIP window.

Other PIP or Seamless Switching tips to keep in mind include:
* When using two digital signals or one analog and one digital, each must be ≤ 165 megapixels.
* When using two analog signals, each must be ≤ 90 megapixels.
* Avoid using an interlaced source in the PIP window
* Seamless switching may affect image quality in some cases

Working with PIP

NOTE: *To control the primary image, access all picture controls through the Main menu. To control the secondary (PIP) image, access picture controls through the Picture-in-Picture or Switching menu.*

Use the first of six options in the *PIP* menu to enable and define how you want to use PIP.

Picture -in- Picture Options

Picture-In-Picture (PIP)

1.   Swap Main and PIP Image
2.   PIP Enable ☑
3.   PIP Size & Position
4.   PIP Image Settings
5.   PIP Border Width 🌐 4
6.   PIP Border Color 🌐 Red ▼
7.   Image Optimization 🌐
8.   Fade Time 🌐
9. Numbers Select Main Image 🌐 PIP Only ▼

Switching Options (n/a)
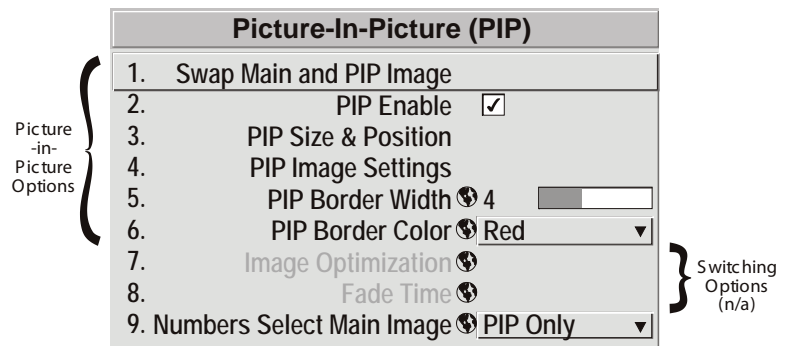

SWAP MAIN AND PIP IMAGE
Toggle the current picture-in-picture relationship so that the primary (main) image becomes secondary (PIP), and the secondary image becomes primary. Swapping is available only when PIP is enabled.

NOTE: *There may be a slight delay when swapping the Primary and Secondary images.*

PIP ENABLE
Short cut: Press ⬭PIP⬭ *on the Remote if menu not present.*

Toggle to display from two sources at once (Picture-in-Picture) or the primary source only. This checkbox turns the secondary source on and off.

NOTE: *Disable PIP and Best Switching for Interlaced sources > 35kHz.*

PIP SIZE AND POSITION – SUBMENU

Most controls in the *PIP Size and Position* menu adjust the PIP (secondary) image in the same fashion as their counterparts in the main *Geometry and Position* menu adjust the main image — see *3.5, Adjusting the Image* for details. Exceptions are:

POSITION PRESETS – Set the location of the PIP (secondary) image in the display.

PIP Size and Position		
1. Position Presets	Bottom Right	▼
2. Size	0.729	▭
3. Vertical Stretch	1.090	▭
4. Pixel Track	858	▭
5. Pixel Phase	0	▭
6. H-Position	360	▭
7. V-Position	262	▭
8. Aspect Ratio Presets	Letterbox	▼
9.		
0. Advanced Size and Position		

ASPECT RATIO PRESETS – Choose the desired aspect ratio for your PIP pixels. Use the "Default" aspect ratio when incoming format has square pixels (most common). This ensures that the resulting PIP image maintains its intended aspect ratio. Use "Anamorphic" for NTSC signals having narrower pixels--this will stretch the pixels horizontally to regain the intended aspect ratio of the PIP image.

NOTE: *If the image is already resized at the source it will remain that way in the PIP window. If, for example, an NTSC signal is already set to anamorphic through the Resize and Preset menu it will remain that way in the PIP window. If the NTSC signal is formatted as widescreen at the source, then the image in the PIP window will appear with black bars above and below it.*

PIP IMAGE SETTINGS — SUBMENU

Adjust the PIP (secondary image) without affecting the size or position. The primary image remains unchanged. See 3.6, Adjusting the Image, for details

PIP BORDER WIDTH
Set the desired line thickness for your PIP window border.

PIP BORDER COLOR
Select the desired color for the PIP window border.

NOTES: 1) *Numbers 7 and 8 on the Picture-in-Picture and Switching submenu control switching parameters.* **2)** *Disable PIP in order to work with Seamless Switching.* **3)** *Disable PIP and Best Switching for Interlaced sources > 35kHz.*

Working with Seamless Switching

Seamless Switching is the ability to instantly and/or smoothly switch sources, and is controlled with options 7 and 8 in the *PIP* menu. To use Seamless Switching, PIP must be disabled.

Tips for best source switching:

• Ensure a channel has been configured for each source.
• Progressive digital and analog sources are recommended.
• Set Image Optimization to Seamless Switching (see below).
• For best results, use the same frame rate and gamma setting for each.

NOTE: *Avoid using two interlaced sources.*

IMAGE OPTIMIZATION
Use this setting to choose what is more important, image quality or switching between sources. Selecting *Best Image Quality* will ensure your image is always proper however when switching sources, the screen will go blank increasing your switching time. *Smooth Switching* allows for a cleaner transition between sources. The image will fade from one image to another according to the *Fade Time* control. *Seamless Switching* overrides the *Frame Lock Enable* settings and forces the output to run at 60Hz regardless of the input signal. Image is 100% seamless when switching sources.

NOTE: *Disable PIP and Best Switching for Interlaced sources > 35kHz.*

FADE TIME
Set how long (in seconds) it takes to gradually dissolve one image into another for a source switch when Image Optimization is set to Smooth Switching.

NOTE: *PIP must be disabled for Fade Time to take effect. Also, the PIP window must be closed to activate it.*

NUMBERS SELECT MAIN IMAGE
Use *Numbers Select Main Image* to use the numeric keys #1-8 as input keys. This remapping of the keypad (see right) can be particularly useful with PIP displays, providing a convenient shortcut for changing the primary (background) image without first having to return to the *Main* menu. Select "Always" to use the keys in this manner all of the time, even with single displays. For normal keypad function, select *Never* (default). Set to *When PIP Active* to activate number keys only when PIP is in use.

NOTE: ***Numbers Select Main Image*** *keypad functionality works only when menus are closed.*

PIP

9. Numbers Select Main Image	When PIP Active ▾	
3.8 Working with the Lamp

Whenever you install a new lamp in the projector, access the *Lamp* menu to record the lamp serial number in the projector's memory. You can also choose a lamp mode for regulating power and light output, change Iris size, and access other read-only information pertaining to past and present lamps.

Lamp		
Lamp Hours	0	
Lamp S/N	?	
1. Lamp Message	⊕ ☑	
2. Lamp Limit	⊕ 1000	
3. Lamp Mode	⊕ Power	▼
4. Power	⊕ 500	
5. Intensity	⊕ 0	
6. Iris	⊕ 3	
7 Lamp History		
8. Change Lamp		

LAMP HOURS (read-only) shows the number of hours logged on the current lamp. Whenever you record a new lamp serial number this value automatically resets to "0", where it begins to log time for the new lamp. This information also appears in the *Information* menu.

LAMP S/N (read-only) is the serial number recorded for the current lamp. When you install a new lamp and enter its serial number, the number will appear here.

Enter a checkmark for LAMP MESSAGE to enable a warning message that will appear upon power-up when the lamp has reached the specified lamp limit and should be replaced. Delete the checkmark to prevent display of this message — instead, when your lamp expires, only the status display messages on the back of the projector will provide the visual warning to replace the lamp.

NOTES: 1) *It is recommended that the Lamp Message checkbox remain enabled.* **2)** *When a lamp warning message appears, press* ⟨Exit⟩ *to temporarily cancel the message. The message will continue to appear upon power-up until you install a new lamp.*

Set **LAMP LIMIT** to the number of hours you expect to log on the current lamp before replacing it. This will trigger a lamp message on-screen (if enabled).

NOTES: 1) *If you change modes over the life of a lamp, the lamp limit you originally expected may no longer be possible.* **2)** *Turning the lamp on and off reduces lamp life significantly, as do other factors.* **3)** *It is recommended that Lamp Limit not exceed the expected lamp life, otherwise a lamp could become dangerously fragile with overuse.*

Set which **LAMP MODE** you want to use in order to control the light output. You can choose to run the lamp as bright as possible (i.e., always using maximum power — this is the default upon power up) or you can power the lamp with a specific wattage appropriate for the

1. Max Brightness
2. Intensity
► 3. Power

installed lamp or you can set a specific intensity (brightness) to maintain. Although there are exceptions, generally higher light output or higher power settings can shorten lamp life.

Use the lamp mode that best suits your brightness needs. For example, in a tiled application you may want to precisely match brightness levels between adjacent images — judge by eye and set each individual **Lamp Power** setting as necessary. Or if you want images to be as bright as possible — choose **Max Brightness**. Always keep in mind that higher lamp power settings can shorten lamp life.
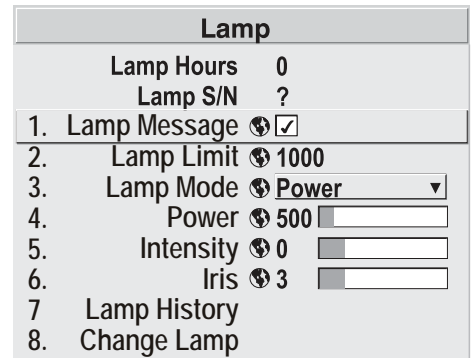

Lamp modes are described below:

- **Max Brightness:** The lamp will always burn as brightly as possible, driven by 100% of the power level rating for the installed lamp (see *Section 6, Specifications*). Keep in mind that the "maximum brightness" for any lamp gradually diminishes with age — images will become dimmer over time. Its current output level appears in the "**Intensity**" option (not in lumens).

- **Intensity:** Brightness will remain close to a specified level for as long as possible. Once you select this option, enter a number representing the intensity level (brightness) you wish to maintain — the projector will automatically adjust power as needed to maintain this intensity as closely as possible. Note that the intensity value is a correlation only and does not represent an actual lumens level. See "**Intensity**" below.

- **Power:** The power supplied to the lamp will remain at your specified wattage level. Once you select this option, enter the number of watts representing the power level you wish to maintain. See "**Power**" below.

POWER – This slidebar and number indicates how many watts are applied to the lamp. You can apply anywhere from approximately 60-65% of the maximum power intended for the installed lamp up to 100% of the lamp rating. Set for the number of watts as desired, keeping in mind that lower power levels produce dimmer images. When in either **Power** or **Max Brightness** modes, the power level remains constant. Specifying a maximum power level here is the same as operating in **Max Brightness** mode.

NOTE: *Power level can be set only if the lamp is in **Power** mode.*

INTENSITY – This value and slidebar represents the current brightness of your lamp, decreasing over time when you are operating in **Max Brightness** mode or at a specific **Power** level. When you are operating in "**Intensity**" mode this value remains at the original "**Intensity**" setting chosen and cannot be adjusted.

NOTE: *The number shown for "intensity" is not the actual lumen output, but rather a correlated value only — 1246 may represent 3500 lumens, for example.*

To use "**Intensity**" mode, judge by eye (or use a meter) and set the level as desired for your application. Over time, the projector will automatically increase the power supplied to the lamp as needed to maintain the chosen intensity as closely as possible.

HOW LONG CAN I MAINTAIN BRIGHTNESS? Software can maintain your "**Intensity**" setting until the required power reaches the maximum rating for the lamp. The lower the setting, the longer it will take to reach this threshold and the longer you can maintain the desired brightness. Keep in mind that once the lamp power reaches its maximum wattage (see "**Power**", above), this tracking is no longer possible. At this point, the lamp will gradually begin to dim as usual, even though your original "**Intensity**" value will still appear in the menu. To resume accurate tracking, reduce the intensity setting so that the resulting "**Power**" value is less than its maximum — the lower the intensity, the longer it can be maintained.

For example, a 1000 watt lamp can be driven at no more than 1000 watts. To produce desired brightness at the screen, a new lamp would likely need less than this maximum rating—perhaps 812 watts (example only). Over time, however, the lamp will require more and more current in order to generate the desired light, until eventually the lamp wattage reaches its 1000-watt maximum and the lamp power automatically levels off. At this point, the tracking function terminates (i.e., the power level stabilizes) and the lamp will begin to dim normally. Either reduce your "**Intensity**" setting or replace the lamp.

Do not lower the "**Intensity**" so much that the corresponding "**Power**" value reaches its *minimum* — the intensity setting will be inaccurate and cannot be maintained. For best results in achieving uniform intensity amongst tiled images, choose an "**Intensity**" setting that enables all lamps to operate at less than the maximum number of watts available in your projector but high enough to keep the corresponding lamp power above its minimum. See "**Power**", above.

NOTES: 1) *Lamps become more stable over time, thus a specific intensity is more easily maintained as the lamp ages.* **2)** *Intensity can be set only if the lamp is in "Intensity" mode* **3)** *Intensity cannot exceed the output of Max Brightness mode.*

IRIS – The IRIS inside the projector controls the diameter of the light beam passing through the system. With a fully open aperture (slidebar default of "0"), the maximum amount of light passes through for maximum brightness in your images. Increase the slidebar setting to reduce the **aperture diameter and maximize contrast ratio instead.**
LAMP HISTORY – This read-only option lists the lamps most recently installed and recorded in the projector. Lamp History automatically updates whenever you record a new lamp serial number — the new lamp is added to the bottom of the list.

Use **CHANGE LAMP** to record the serial number for a newly installed lamp:

In the *Lamp S/N* window, use the number text entry keys to record the new lamp serial number and press again to accept the change. See *Using Slidebars and Other Controls* if you need help entering the number. Once entered, the new lamp serial number will be added to the *Lamp History* menu and the *Lamp Hours* timer will reset to "0". *Lamp Mode* and *Lamp Limit* remain as they were for the previous lamp and can be changed at any time. See Figure 3.19.
Figure 3.19. Recording the New Lamp Serial Number

NOTE: *Enter a serial number **only** if you have just installed a new lamp. This will help ensure that lamp timer is not reset on an old lamp and that the number of hours logged on the lamp will be accurate.*

IMPORTANT: Always record the serial number of a NEW lamp.

How Old is My Lamp

When a new lamp is installed and its serial number recorded by selecting "Change Lamp" in the *Lamp* menu, the lamp timer resets to "0" and begins logging time for the new lamp. This tally appears in both the *Lamp* menu (see right) and the *Information* menu.

To review the number of hours logged for previous lamps, consult the *Lamp History* menu.

Lamp		
	Lamp Hours	147 ◄──
	Lamp S/N	123456789
1.	Lamp Message	🌐 ☑
2.	Lamp Limit	🌐 1000
3.	Lamp Mode	🌐 Power ▼
4.	Power	🌐 500 ▭
5.	Intensity	🌐 0 ▭
6.	Iris	🌐 3 ▭
7.	Lamp History	
8.	Change Lamp	

When to Replace the Lamp

If the "Lamp Message" checkbox has been enabled in the *Lamp* menu (recommended), an expiry message will appear upon power-up when the lamp has reached its defined "Lamp Limit". The lamp should be replaced.

The "Lamp Limit" setting should not exceed the expected lamp life, as an old lamp becomes increasingly fragile and more prone to sudden failure.

Information Menu

The read-only *Information* menu lists a variety of details about the standard and optional components currently detected in the projector. Refer to the *Information* menu for versions of hardware and software installed, the type (size) of lamp, the hours logged in total and for a specific period (such as a rental period), and for your projector model name and serial number. In addition, the *Information* menu identifies the current channel, its location, its frequencies and other details.

Scroll the full *Information* menu using (▲) (▼). Use (◄) (►) for page up/down.

3.9 Achieving White Field Uniformity

WHAT IS WHITE FIELD UNIFORMITY?

• No area of the screen appears more red, green or blue than another
• No area of the screen appears brighter than another
• Color and light output from one screen closely matches adjacent screens

⚠️ *Before You Begin*

Read through the entire procedure before attempting to adjust White Field Uniformity controls, and keep in mind the following checklist of prerequisites and guidelines:

❑ **ADJUST COLORS FIRST** — Always adjust the primary colors as described in the "*Matching Colors in Multiple Screens*" procedure (above) before attempting to work with White Field Uniformity. This ensures that primary colors, color temperature, and maximized light output are all well matched from one screen to another. These matches are needed before you can achieve good White Field Uniformity results.

❑ **RUN LAMP FOR 100 HOURS** — Light output and White Field Uniformity can vary significantly during the first 100 hours of lamp use. For best results with new lamps, either set up White Field Uniformity after this period, or do an initial setup and re-check at 100 hours

❑ **SET LAMP POWER** — Ensure that each "Lamp Power" setting is as high as possible for your application while still maintaining a good overall match of light output from screen-to-screen. By nature, achieving a *uniform* brightness will require a slightly reduced *overall* brightness—this reduction will help ensure that you have enough range of adjustment when examining brightness variables more closely from screen-to-screen, and will help prevent premature "maxing out" when trying to match to a certain color, zone or projector.

❑ **USE A "USER" COLOR TEMPERATURE** — Always adjust White Field Uniformity for a *User* color temperature defined when you matched primary colors, and continue to use it for all sources displayed on the wall. Your other color temperatures will not necessarily be matched from screen-to-screen.

❑ **WHITE UNIFORMITY SLIDE BARS** — White Uniformity slide bar values may not reduce to "0". Each slide bar adjusts overall light output in a specific screen zone, but the value shown represents the current setting for *green* in this zone. When other "hidden" values (red or blue) are lower than green, during adjustment in the White Uniformity menu their values will reach "0" first, causing the slide bar to stop earlier than expected.

❑ **JUDGE BY EYE OR USE A METER** — Good White Field Uniformity can be achieved with either.

STEP 1: GENERAL SETUP

1a) Adjust primary colors (see Matching Colors in Multiple Screens) to ensure matched overall color temperatures and light output between screens.

⚠ **IMPORTANT** ⚠
Double-check that all WHITES and LIGHT OUTPUT are well-matched.

1b) Enable the White Field Uniformity checkbox. This will enable access to the uniformity controls and will apply the settings to your image.

White Field Uniformity		
1.	Uniformity Enable	🌐 ☑
2.	Test Pattern	Off ▼
3.	Left Uniformity	
4.	Right Uniformity	
5.	Top Uniformity	
6.	Bottom Uniformity	
7.	Top Uniformity	
8.	Color Adjustment by X,Y	
9.	Color Temp Adjust	
0.	Lamp	

1c) Select the 13-Point test pattern for display. This pattern provides nine screen "zones" with 13 targets.

FOR BEST RESULTS: Rather than examining the CENTER of each zone when assessing White Field Uniformity adjustments focus on extreme EDGES as indicated in the illustration at right.
Figure 3.20. Test Pattern

1d) In either Color Adjustments menu, select a "User" color. Then:
• If you have created a "User 1" color gamut (recommended) for a well-matched wall, continue to Step 1e.
• If you prefer maximum brightness rather than a particular color temperature, select "Max Drives".

IMPORTANT: Do not change User 1 Color Adjustment in color-matched applications!

1e) In the *White Uniformity* menu, set the "Overall" output level to **50.0** and all remaining slide bars to **0.0**. This decreases the light output just enough throughout the screen so that any color level can then be increased later as necessary for matching light output from zone-to-zone. Do not exceed **50.0** for "Overall"—a higher level will likely interfere with achieving White Field Uniformity and is not recommended.

Ensure that overall light output remains well matched from one screen center to the next. Where necessary, increase or decrease Lamp Power slightly to recover center matches.

White Uniformity		
1.	Left Side	0.0
2.	Right Side	0.0
3.	Top Edge	0.0
4.	Bottom Edge	0.0
5.	Top Left Corner	0.0
6.	Top Right Corner	0.0
7.	Bottom Left Corner	0.0
8.	Bottom Right Corner	0.0
9.	Overall	50.0

◄ Set to 50.0

Adjust light output of entire screen.

STEP 2: ADJUST COLOR (LEVEL OF RED/GREEN/BLUE) IN EIGHT ZONES

NOTES: 1) *At this point, ignore the* **brightness** *of individual zones.* **2)** *Always ignore menu colors.*

2a) On each screen, compare the color temperatures in the eight target zones (four edges and four corners) to that of the color temperature of the center. Compare using a **white** field only, and take note of any areas that do not match the center. Also decide if any screen exhibits a more obvious color shift than other screens — begin with this screen in Step **2b**.

2b) Return to the *White Field Uniformity* menu. Beginning with the screen that exhibits the most obvious color shift(s), for each edge that exhibits a noticeably different color temperature from the center, select the corresponding *Uniformity* adjustment menu — *Left, Right, Top* or *Bottom*. For example, if any part of the left side is too blue, too red or too green, go to the *Left Uniformity* menu and adjust the colors (i.e., change their light output) until all portions of the left side closely match the center color temperature. Adjust an edge first (focusing on its center), and then adjust its corners. See Figure 3.21.
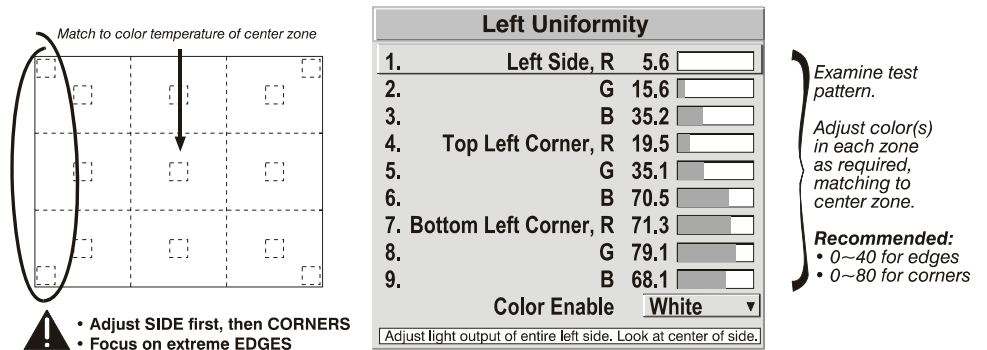

Figure 3.21. Match Zones to Center Color Temperature

Repeat the color adjustment of sides and corners for each edge of the screen that does not yet match the center (note that each corner is adjustable in either of its two adjacent "side" menus). When done, all areas of a given screen should match. Repeat Steps **2a** & **2b** for all remaining screens.

STEP 3: ADJUST LIGHT OUTPUT IN EIGHT ZONES

3a) For each screen, compare the light output of each *edge* and *corner* to that of the *center*. If any of the areas differ, use the *White Uniformity* menu to match edges and corners to the center as described below (see Figure 3.22). Begin with the screen exhibiting the most obvious variations in light output.

• Adjust **edge** *White Uniformity* first—note that each edge adjustment also affects the rest of the screen slightly. Keep all edges just slightly lower than the center light output rather than matching light output precisely. Otherwise, it may not be possible to brighten the corners (typically the dimmest areas of the screen) enough. I.e., the best uniformity is a compromise between the brightest and darkest areas of the screen.
• Adjust **corner** *White Uniformity* last—each corner adjustment affects only this quadrant.
• Repeat for each screen.

Match light output
to center zone

White Uniformity

1.	Left Side	35.6
2.	Right Side	17.4
3.	Top Edge	9.2
4.	Bottom Edge	10.2
5.	Top Left Corner	35.1
6.	Top Right Corner	73.5
7.	Bottom Left Corner	3.0
8.	Bottom Right Corner	9.4
9.	Overall	50.0

Adjust light output of entire left side. Look at center of side.

Examine test pattern.

Adjust light output in each zone as required, matching center zone.

Do corners last.

Recommended:
• *0~40 for edges*
• *0~80 for corners*

Figure 3.22. Match Zones to Center Light Output

STEP 4: READJUST COLOR TEMPERATURE (LEVEL OF RED/GREEN/BLUE) IN EIGHT ZONES

NOTES: 1) *At this point, ignore the* **brightness** *of individual zones.* **2)** *Always ignore menu colors.*

4a) Return to Steps **2a** & **2b** and, if necessary, fine-tune the zones so that they all still exhibit a single color temperature.

CANCELLING WHITE FIELD UNIFORMITY
If you do not want to use or apply White Field Uniformity settings, delete the checkmark from the "Uniformity Enable" checkbox at the top of the *White Field Uniformity* menu.

3.10 Edge Blending

Edge Blending is an innovative set of software functions that can quickly and easily blend white levels along the edges of multiple adjacent projected images to create a single seamless larger image.

WHAT IS A BLEND?
In simple terms, a blend appears as a gradient strip along an edge of a projected image. It is darkest along the extreme edge of the image, and lightens nearer to the rest of the image (see right).
Blend

HOW ARE BLENDS USED?
In multiple-projector walls, complementary blends between neighboring images can compensate for the extra "brightness" or intensity where these edges overlap. By controlling blend width and other properties, you can achieve uniformity across the group of images. Visible overlaps will disappear:

Overlap

Overlap →

Proj. 1,1 Proj. 1,2

Image

Proj. 2,1 Proj. 2,2

With edge blending:
Blend

Proj. 1,1 Proj. 1,2

Image ← Blend

Proj. 2,1 Proj. 2,2
Figure 3.23. Edge Blending Concept

For best results, use the same projector model and type throughout your display wall. In addition, avoid high-gain screens whenever possible—the optical performance of such screens demands minimal image offset, thus projectors must be located very close to one another.

Edge blending software controls are located in the two-page *Edge Blending* submenu—access via *Display Setup* menu, then go to the *Geometry and Color* menu and select *Edge Blending*. The *More* option opens the second page of the *Edge Blending* submenu.

MAIN FUNCTIONS

Use Edge Blending controls to set the precise *width*, *shape* and *midpoint* you need to blend overlapping edges together smoothly.

*   **Blend Width** determines how much area is used for blending along an overlapping edge. Slide bar values represent the number of eight-pixel steps used for the blend. For example, a setting of "eight" creates a blended edge 24 pixels wide. A setting of "0" signifies no blending. For best results in most applications, use a blend width of 16-48 steps (128-384 pixels).

    Ranges: 0-80 horizontal, 0-60 vertical.

*   **Blend Shape** determines the rate of roll-off across the blend width, i.e. how quickly the white levels across the blend change from light and dark. Increasing the *Blend Shape* setting accelerates the rate of change at both extremes so that less of the region appears mid-gray (see Figure 3.24). Decreasing the *Blend Shape* setting slows the rate of change so that more of the region appears mid-gray. For most applications, this subtle control is best left close to 50.

(NOTE: Simulation shown darker for printed page)
Figure 3.24. "Shape" Examples

*   **Blend Midpoint** determines the white level at the blend midpoint (the point equidistant between the beginning and end of the blend). Increasing the *Blend Midpoint* setting creates a blend that appears brighter than the rest of the image. Decreasing the *Blend Midpoint* setting creates a blend that is darker than the rest of the image. A setting of 50 means the midpoint is approximately 50% black—for best results in most applications, keep fairly close to this default.

(NOTE: Simulation shown darker for printed page)
Figure 3.25. "Midpoint" Examples

- **Show Blending** Overlap turns your defined blend width area to solid gray so that, if needed, simply overlapping the gray bars can seamlessly align two adjacent images. Toggle the Show Blending Overlap off to reactivate the blend effect.

  NOTE: *Blending Overlap appears as Reserved when Wolf WARP is installed.*

OTHER FUNCTIONS

For convenience, the *Edge Blending* submenu also includes related options for enabling a specific color and/or test pattern, or for working with colors or the lamp. Such functions duplicate those provided elsewhere in the menu system.
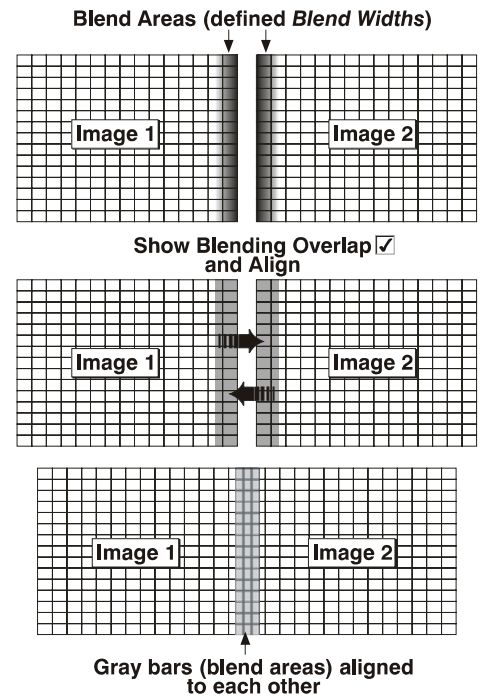

Figure 3.26. Blend Areas

EDGE BLENDING PROCEDURE

NOTE: *Before attempting to work with edge blending software functions, you must **1)** physically align the projectors/images by correctly overlapping the displays from your intended external source, and **2)** Match colors and White Field Uniformity.*

IMPORTANT: For a shared edge, all *Blend* procedures and settings should be identical on BOTH projectors.

1. Start with two projectors. Display full white field test pattern from both.
2. In the *Edge Blending* submenu, enable *Edge Blending* by entering a checkmark in the top checkbox.
3. SET STARTING POINTS FOR ADJUSTMENT:
- Set all blend widths to 0.
- Go to "More" and set everything in the *Edge Blending (2)* menu to 50.

Figure 3.27. Set Starting Points for Each Projector

4. **SET BLEND WIDTH:** On one projector, increase the *Blend Width* for an overlapping edge (for example, if the projector's image is on left, its right edge overlaps the adjacent image — adjust *Right Blend Width*). Use the same setting on the second projector for this shared edge.

5. Re-adjust width (both projectors) until the overly bright band at the midpoint of the overlapping blends disappears or just changes to very light gray. For the shared edge, use the same *Blend Width* setting on each projector. If the "best blend" appears to be between two settings, choose the wider setting for both projectors.

6. **CHECK BLEND:** If the blended region appears too dark or light in relation to the rest of the image:

• Increase *Blend Midpoint* in both projectors to "lighten" the overall blend, decrease to "darken" the overall blend.

• Adjust *Blend Shape* in both projectors to fine-tune change the amount of mid-gray intensity (as opposed to black/white) in the blend.

7. Repeat with remaining projectors / overlaps.

8. Check completed display wall with the desired external signal.

9. Adjust mechanical alignment if necessary to maintain perfect pixel-on-pixel alignment over time.

In applications where you are projecting only white or light images, the Blend Width may be slightly higher—set according to how much overlap you have between images. Use the following as a guide (examples show overlapping width only — values for overlapping height will differ):

• Recommended overlap is 12.5% - 25%

Black Edge Blending

Similar to Edge Blending, Black Edge Blending allows you to adjust the black level hues of multiple adjacent projected images to create one large seamless display. Edge blending must be enabled in order to use the Black Edge Blending features.

BLACK EDGE BLENDING PROCEDURE

NOTES: 1) *Adjust white levels before adjusting black levels.* **2)** *The zones in BLB menu correspond to the Edge Blend zones. If a given Edge Blend zone width is set to 0 (i.e. no blend on that side) then the corresponding BLB zone is disabled. It only becomes accessible when that Edge Blend zone is active.*

1. Start with two projectors. Select the black test pattern for both projectors from the *Geometry and Color* submenu.

2. In the *Black Edge Blending* submenu, enable black blending by putting a checkmark in the checkbox for each projector.

Black Edge Blending			
1.	Black Blending Enable	🌐	✓
2.	Center Brightness	🌐	0
3.	Black Red Level	🌐	128
4.	Black Green Level	🌐	128
5.	Black Blue Level	🌐	128
6.	Top		
7.	Bottom		
8.	Left		
9.	Right		

3. Working with one projector at a time, use the center brightness slide bar to adjust the center brightness (brightness of the non-blended region) so that the center intensity matches that of the brightest blended region (the center of all images when blending a 2 x 2 display is the target area).

4. Use the following three color slide bars, Black Red Level, Black Green Level and Black Blue Level, so the black hue of each projector matches.

5. You can choose which of the next four options, Top, Bottom, Left, Right, to use depending on which edge of the projector you are working with has been edge blended. The blend width can be adjusted to line up properly but by default it corresponds to the edge blending setting determined for that edge.

Top		
1.	Top Brightness ⊗123	� filled
2.	Top Left Brightness ⊗ 0	
3.	Top Right Brightness ⊗ 0	
4.	Top Width ⊗117	
5.	Black Red Level ⊗128	
6.	Black Green Level ⊗128	
7.	Black Blue Level ⊗128	

Not applicable when blending two projectors (corresponds to sides selected in Edge Blending menu).

6. The brightness and black hues of the blended region can be adjusted in more detail in case fine-tuning is needed (may be only necessary for blending a 2 x 2 projector display because of blending differs for the sides and center).

NOTES: 1) *The menu options vary depending on the Edge Blending parameters.* **2)** *You may need to re-adjust the black level hues following the overlap adjustments on each blended edge.* **3)** *When adjusting six or more projectors, you need to ensure that the hue and brightness of each target area is matched at closely as possible.*

3.11 Remote Control of the Projector

As an alternative to using a keypad, most projector functions can be controlled remotely, typically at a controller such as a PC, via 1) simple bi-directional ASCII messaging on an Ethernet or serial communication link or 2) a web interface or an Ethernet network. Using a PC interface can also prove to be useful in instances where extreme warping is applied and the menu items become illegible and hard to navigate.

VIA ASCII MESSAGING — Connect a serial link between your controller and the RS232 or RS422 port (recommended), or open an Ethernet socket (i.e., Telnet) between your controller and the valid projector address. Valid ASCII codes and messages are documented in the *Serial Communications* document available in Appendix B.

VIA WEB INTERFACE — Connect your PC to the projector's Ethernet port. In your web browser (*Internet Explorer*, for example), enter the IP address of the projector you wish to control. This will start a password-protected application — enter the factory default "**ccm7**" login and password to open the program. If the projector is powered up, you can access assorted menu options and slide bars.

Repeat for remaining networked projectors as desired. Keep in mind that multiple units can be controlled from one PC, but each unit will be in its own interface (web browser) at the PC. Likewise, you can make up to five separate web locations to a single projector.

The default login provides access to security settings, where you can define other users with the same or fewer rights. Use "unlimited" rights for most applications. For all logins, the Service menu is still protected with its own password.

3.12 Error Conditions

Occasionally the projector will encounter an error condition that can interrupt normal operation. Such a condition can be caused by a simple invalid keypad entry, an input signal error (most common) or a system error. The manner in which users are to be notified of error conditions is set in the Menu Preferences menu:

- To see error messages displayed on-screen, select the "**Scree**n" or "**All**" option (recommended by Wolf Cinema).
- To be notified via a serial communication only, select the "**RS232**" option.
- To receive both types of notifications, select "**All**".
- To disable error messages (except for "invalid user key entry", which can't be hidden), select "**Off**".

Note that a two-digit error code appears in the status LED display window located beside the built-in keypad at the rear of the projector. Normal operation is indicated by the "On" status code.

LED status display window →
Figure 3.28. Projector Keypad

User Errors

INVALID USER ENTRY
A keypad entry not recognized by the projector triggers a short on-screen error message identifying the problem. For example, if you specify a channel number that is not available, the message "Invalid Channel will appear. Or if you try to enter the wrong password, you'll see "Invalid Password". Press ⏎ or Exit to clear the message and try again.

NOTE: *On-screen display of "Invalid User Entry" messages cannot be disabled, even if **Display Error Messages** has been set to "Off".*

Input Signal Errors

An input signal error message occurs if you are in presentation level (i.e., there are no menus present) and have selected an input on which the projector detects a problem. While menus remain operational and any key press will temporarily remove any displayed error message, you must resolve the signal problem in order to permanently eliminate the message.

NO SIGNAL
The message *"No signal"* occurs when there is no source signal detected at the selected input—both HSYNC and VSYNC are inactive and the screen background is black. Connect or correct the signal, or try another input.

BAD SYNC
The message *"Bad Sync"* occurs when HSYNC or VSYNC are active but the signal cannot be displayed. Such a condition occurs when only one of the two sync signals is present or when either sync signal is unstable or is the wrong frequency. Correct the signal or select another input.

OTHER SIGNAL ERROR MESSAGES
In addition to the common *"Bad Sync"* and *"No Signal"* errors, you may encounter a signal error message indicating that HSYNC and/or VSYNC are either too fast or too slow. When such a message appears, check the frequencies shown in the *Information* menu. If they are correct, the projector does not recognize the signal. On some PCs you may be able to change the settings to generate a compatible signal. If the frequencies shown in the *Information* menu are incorrect, check the cabling to see where the problem might originate.

System Warnings / Errors

When the projector encounters a system malfunction, either a System Warning message or a System Error message may appear. Both types of messages are accompanied by a numerical error code on the status LED display. A system malfunction can be cleared with ⟨Exit⟩ ⟨Exit⟩ from presentation level, but may indicate the need for service by a qualified service technician.

NOTE: *System messages appear on-screen only if **Display Error Messages** has been set to "Screen" or "All".*

SYSTEM WARNINGS
A system warning indicates that a system malfunction has been detected (see Status LED Codes, below). A system warning message replaces any input signal message and disappears when the input signal status changes. While the projector will remain operational, the message indicates the presence of a potentially serious problem that should be investigated. You can press ⟨Exit⟩ ⟨Exit⟩ to remove the message, but for best results you should reset the projector — power the projector down and up again with the ⟨⟳⟩ (power) key.

SYSTEM ERRORS
A system error message indicates that a serious malfunction has been detected and must be investigated as soon as possible (see Status LED Codes, below). The projector will no longer operate and must be reset — power the projector down and up again with the ⟨⟳⟩ (power) key.

THE STATUS LED CODES
If the status code display on the back of the projector shows one of the following values, you have encountered a likely system error requiring the attention of a qualified service technician (see *System Warnings* and *System Errors*, above). Acknowledge and clear the error with ⟨Exit⟩ ⟨Exit⟩ from presentation level, or try resetting the projector by powering it off and on again, cooling when necessary. Consult ***Table 3.6*** and contact your dealer if the problem persists.

The specific code number identifies the source of the error detected, and is particularly useful in cases where the projector is far away. For example, the code "27" means the lamp could not be turned on. Error codes for this projector are listed in Table 3.6 on the next page.

Code	Description	Code	Description
	GENERAL		**BUILT-IN KEYPAD**
12	Software bug. Contact dealer/factory.	70	Unable to access EEPROM on the built-in keypad
13	CRC error in flash ROM. Download new software.	71	EEPROM memory re-initialization on the built-in keypad
14	Engineering-only programming is complete. Call Wolf Cinema, replace TIPM.		**PANEL DRIVER AND FORMATTER**
15	Attempting to download code without being in boot mode	80	Unrecognized Panel Driver
16	Invalid interrupt. Power off/on. If it persists, contact dealer/factory.	81	Unable to program device on Panel Driver
17	User forced system to stay in boot mode	82	TI flash download failure
18	*Jumper for programming boot not installed*	83	TI flash download failure
	LAMP FAILURES	84	TI flash download failure
20	Lamp turned on unexpectedly (fault related to ballast)	85	TI-I2C write failure
21	Lamp airflow low, overheating imminent	86	One or more Formatters not responding — Probable Formatter s/w fault
23	Cannot read valid ballast ID	87	Formatter reports RDRAM failure
26	Lamp 1 Interlock: lamp door open, lamp not installed	88	Red modular Formatter communication failure
27	Can't turn lamp on	89	Green modular Formatter communication failure
28	Lamp turned off unexpectedly	8A	Blue modular Formatter communication failure
29	Lamp ballast overheated	93	Modular formatter architecture error
	POWER AND COOLING	94	Modular formatter DMD mismatch
46	Red DMD temperature probe overheated	95	Modular formatter sequence mismatch
4C	Projector shutdown due to critical error		**MISCELLANEOUS**
C0	Lamp blower failure (lamp not turned on)	A0	Unable to program the optional module
51	LVPS fan failed (Fan 1)	A1	Unable to power the optional module
52	LVPS/ Red cooling fan failed (Fan 2)	A2	Unable to program the Dual Slot Backplane Module (DSBP)
53	DC lamp fan failed in DCX-500 / DCX-1000 models (Fan 3)	A3	Unable to program the optional Post Processing Module (Warp module)
54	Red DMD heatsink fan failed on DCX-1000 and DCX-1500 models (Fan 4)		
55	Green DMD heatsink fan failed on DCX-1000 and DCX-1500 models (Fan 5)		
56	Blue DMD heatsink fan failed on DCX-1000 and DCX-1500 models (Fan 6)		
57	TIPM fan failed (Fan 7)		
58	TIPM fan failed (Fan 8)		
	TIPM (Image Processor)		
60	Boot code CRC failed		
61	Unable to program DigMux PLD		
62	Unable to program Control PLD		
63	Unable to program Bubks PLD		
64	Unrecognized ROM type		
65	Write to flash ROM failed		
66	TIPM failure		
67	Downloaded code will not fit		
68	Scaler communication problem		

Clear system errors with (Exit) (Exit). *If necessary, try resetting the projector by powering it off and on again (cooling if necessary). For detailed information, monitor the RS232 IN port. Contact dealer/ factory if error persists. Codes omitted from this table should not appear in your projector.*

Table 3.6. Error Codes

MAINTENANCE

4.1 Warnings and Safety Guidelines

The projector is an international regulatory agency approved product designed for safe and reliable operation. To assure complete safety at all times it is important to acknowledge the following precautions while operating the projector.

⚠️ **WARNING** ⚠️
Always power down the projector using appropriate procedure and disconnect all power sources before cleaning or servicing.

⚠️ **WARNING** ⚠️
Always remove the lens when shipping the projector.

⚠️ **WARNING** ⚠️
NEVER look directly into the projector lens.
The high brightness of this projector could cause permanent eye damage.

⚠️ **WARNING** ⚠️
For protection from ultraviolet radiation, keep all projector shielding intact during operation.

CAUTION
Qualified personnel should perform installation ONLY.

Labels and Markings

Observe and follow all warnings and instructions marked on the projector.

The exclamation point within the equilateral triangle alerts the user to important operating and maintenance (servicing) instructions in the literature accompanying the projector.

The lightning flash and arrowhead symbol within the equilateral triangle alerts the user to uninsulated "dangerous voltage" within the projector's enclosure that may be of sufficient magnitude to constitute a risk of electric shock.

Instructions

Read all operating instructions prior to using the projector.

Projector Location

Operate the projector in an environment, which meets the operating range specified in *Section 6 – Specifications.*

- Do not operate the projector close to water, such as near a swimming pool. Do not operate in extremely humid environments.

- Do not place the projector on an unstable cart, stand or table. A projector and cart combination should be used with care. Sudden stops, excessive force and uneven surfaces may cause the projector and cart combination to overturn.

- Only use Wolf Cinema-approved ceiling mount fixture, if the projector is to be ceiling mounted.

Lamp

Lamp: The projector uses a Cermax® Xenon lamp to deliver its high brightness. A lamp should be replaced when it has reached its end of life or if a noticeable change in brightness occurs. Keep track of the number of hours the lamp has been in use (*Lamp Menu*) and be aware of any changes to brightness. These indicators will help you effectively maintain operation of the projector.

⚠ **WARNING** ⚠

Wait approximately five minutes after powering down the projector to allow internal cooling fans to stop and for the lamp to cool sufficiently before removing.

Never attempt to remove the lamp housing directly after use. The lamp is under great pressure when hot and may explode, causing personal injury and/or property damage. Allow cooling completely.

⚠ **WARNING** ⚠

Use only lamps supplied by Wolf Cinema.
Use lamps of the correct wattage for your projector model when replacing.

Refer to *4.4 Lamp Replacement for instructions.*

Power Cord and Attachments

⚠ **The North American rated power cord is provided with each projector. Ensure that you are using a power cord, socket and power plug that meets the appropriate local rating standards.**

Use only the attachments and/or accessories recommended by Wolf Cinema.
Use of others may result in the risk of fire, shock or personal injury.

⚠ **WARNING** ⚠

Use only an AC power cord recommended by Wolf Cinema.
Do not attempt operation if the AC supply and cord are not within the specified voltage and power range.

• Do not set or rest items on the power cord. Place the projector in an area where the projector cord cannot be abused or damaged by persons walking on it or by objects rolling over it.

• Operate the projector at the specified voltage only. Do not overload power outlets and extension cords as this can result in fire or shock hazards.

• The projector is equipped with a three-wire plug having a third grounding pin. This is a safety feature – if you are unable to insert the plug into an outlet contact an electrician to have the outlet replaced. Do not defeat the safety purpose of this grounding-type plug.

Ventilation

Slots and vents in the projector provide ventilation. Never block or cover these openings. This ensures reliable operation of the projector and prevents overheating.

- Do not place the projector over a radiator or heat register. The projector should not be placed in an enclosure unless proper ventilation is provided.

- Do not insert objects into the ventilation openings of the projector. They may touch dangerous voltages or short-out components resulting in a fire or shock hazard. Do not spill liquids of any kind into the projector. Should an accidental spill occur, immediately unplug the projector and have it serviced by a qualified service technician.

Servicing

If any of the following conditions exist, immediately unplug the projector from the power outlet and ask a qualified service technician to look at it.

- The power cord has been damaged.

- The internal cooling fans do not turn on within two minutes when the projector is first powered up.

- Liquid has been spilled into the projector.

- The projector has been exposed to excessive moisture.

- The projector is not operating normally or its performance has significantly deteriorated in a short period of time.

- The projector has been dropped or the shipping case (if applicable) has been badly damaged.

⚠ WARNING ⚠
Do not attempt to service the projector yourself. All servicing must be performed by Wolf Cinema accredited service technicians.

Use replacement parts that are manufacturer-approved only. Use of any other part other than the ones specified by the manufacturer can result in fire, electric shock or other damage.

4.2 Cleaning and Maintenance Guide

Part Description	Frequency	Action
Lens	As required	Clean the lens only when absolutely necessary. A small amount of dust on the lens has very little effect on picture quality. **To clean:** Use a soft microfiber cloth without any chemicals. Use only a high-quality coated optics cleaning fluid, which can be purchased from most camera supply stores. Apply the coated optics fluid directly onto the microfiber cloth until moistened. Wipe in a single sweep across the surface of the lens. To avoid scratching the lens **do not** scrub or rub in a circular motion. Discard the cloth after every use. Do not use cleaning tools treated with Ether. Do not use cleaning solvents that contain ammonia. Use compressed air to remove any particles remaining on the lens.
Lamp	As required	**CLEAN:** Clean if absolutely necessary. Never touch the glass surface of the lamp. Fingerprints left on the glass will seriously degrade lamp performance or cause "hotspots" which can lead to an accumulation of intense heat in the touched area and cause the lamp to shatter. **To clean:** Wait until lamp is cool. Moisten a clean, microfiber cloth with isopropyl alcohol and gently rub the surface of the glass in a circular motion until clean.
	1000 hrs or sooner if required	**REPLACE:** Refer to *4.4 Lamp Replacement* procedure later in this section.
Covers (External)	As required	**CLEAN:** Clean dust from external covers using a clean, microfiber cloth as required. **NOTE:** *Before cleaning the modules, it is recommended that you install the lens cap. This will keep dust particles from settling on the glass surface of the lens.*

Table 4.1. Maintenance Guide

⚠️ **WARNING** ⚠️
**Proper face shield and protective gloves are required if
the lamp module is removed from the projector.**

4.3 Replacing Remote Batteries

The IR Remote Keypad uses two AA size, 1.5V batteries (preferably alkaline). To install new batteries:

1. Open the battery compartment at the backside of the keypad by placing your thumb in the oval depression and sliding the cover out about ½ inch. See Figure 4.1. Remove the old batteries and properly discard. Wait a minute or two.
Figure 4.1. Replacing Batteries

2. Place the new batteries in the compartment, orienting the positive/negative of each battery according to the labels in the compartment. When the batteries are in place, replace the cover by placing the cover ½ inch from its closed position and slide it into place. Do not force the cover.

NOTE: *Always wait a minute or two when replacing batteries so that the internal electronics discharge and can recognize the change.*

4.4 Lamp Replacement

Use the following instructions when replacing the lamp. The lamp is located at the back of the projector (below the input panel) and can be accessed by removing the lamp access panel. Use only the Wolf Cinema approved *Lamp* for your specific projector model. See Table 4.2 below.

Table 4.2. Lamp Guide

Projector Model	Lamp (Watts)
DCX-500i	500W
DCX-500FD	500W
DCX-1000i	1000W
DCX-1000FD	1000W
DCX-1500i	1200W
DCX-1500FD	1200W

A lamp should be replaced when it reaches its end of life (2000 hours, typical) or sooner if a noticeable degradation in brightness occurs (typical in aging lamps). You can set the number of hours you expect to log with the lamp before replacing it, by setting the Lamp Limit in the Lamp menu. You can also enable a warning message to appear upon powering up the projector that will indicate the lamp has reached the limit you set, by entering a checkmark beside the Lamp Message option.

NOTE: *The lamp mode you choose to run the projector in may have an impact on the number of hours expected for the lamp.*

NOTE: *The lamp mode you choose to run the projector in may have an impact on the number of hours expected for the lamp.*

Tools required: #2 Phillips screwdriver

WARNINGS

⚠️ **A qualified service technician must perform lamp replacement.**

⚠️ **Cool the lamp completely and handle by the housing only.**

⚠️ **Install the correct wattage lamp supplied by Wolf Cinema (see above) and read the Lamp Replacement procedure in its entirety before proceeding.**

⚠️ **Do not touch the glass surface of the lamp. Fingerprints left on the surface can lead to an intense accumulation of heat called a "hotspot", which could potentially result in the lamp shattering. It is recommended you wear clean, lint-free gloves and a face shield when working with the lamp.**

1. **TURN THE LAMP OFF**
   Press ⏻ (power) to turn the lamp off. Allow the cooling fans to stop automatically (within approximately five minutes) before proceeding with Step 2. This wait period is also required to allow the lamp to sufficiently cool before handling.

2. **UNPLUG THE PROJECTOR**
   When the cooling fans have stopped, turn the projector's main switch off, and unplug.

⚠️ WARNING ⚠️
Always power down and unplug the projector prior to servicing.
Allow the lamps to cool before handling.

3. **REMOVE THE LAMP DOOR**

⚠️ WARNING ⚠️
Protective gear required. Wear a face shield.

Using a #2 Phillips screwdriver, remove the two (2) screws securing the lamp door, which is located at the rear of the projector below the input panel. See Figure 4.2.

Lamp Door - 2 Screws
Figure 4.2. Open Lamp Door

4. **RELEASE THE LAMP LOCK**
    Pull out and turn the lamp lock lever, which is located to the left of the lamp module, and turn it ¼ turn counter clockwise to the "unlock" position. See Figure 4.3.

Figure 4.3. Release the Lamp Lock
5. **REMOVE THE LAMP MODULE**
    Firmly grasp the lamp by its housing only and pull it straight out (lamp slides along guides) until it is free. See Figure 4.4. Discard the lamp using safe disposal/recycling practices.

Handle lamp by housing only.

Figure 4.4. Remove the Lamp Module
6. **INSERT THE NEW LAMP MODULE**
    Align the new lamp with the top and bottom guides on the left side of the lamp compartment (see Figure 4.5). Slide the lamp all the way in – a slightly harder push may be required right at the end to ensure it's fully seated into the terminal block.

    NOTE: *The lamp module must make __full contact__ with the terminal block. The projector will not power up again if the lamp is not fully connected to the terminal block.*

When inserting new lamp, align with top and bottom guides.

Figure 4.5. Insert New Lamp Module
⚠ **WARNING** ⚠
Improper installation could cause a serious meltdown inside the projector.

7. LOCK IN THE NEW LAMP MODULE
Pull out and turn the lamp lock lever (turned up in Step 4) ¼ turn clockwise to "lock" the lamp in place.

NOTE: *If you can't turn the lamp lock into position, it is likely the lamp is not fully inserted. In this case, partially remove the lamp and try pushing it back in again. Then, try switching the lock lever to the "lock" position.*

8. REPLACE THE LAMP DOOR
Replace the lamp door and secure it with the two (2) screws removed in Step 2.

IMPORTANT: The lamp module is calibrated for maximum performance and brightness in this projector. Do not attempt to re-align or adjust the lamp module.

9. RECORD THE SERIAL NUMBER OF THE NEW LAMP
- Plug in the projector and power it up.
- In the Lamp menu, select "Change Lamp".
- In the Lamp S/N text box, enter the serial number.
- Press to record the number and to reset the lamp timer. The timer will now begin to log time for the new lamp.

Lamp	
Lamp Hours	0
Lamp S/N	?
1. Lamp Message	🌐 ☑
2. Lamp Limit	🌐 1000
3. Lamp Mode	🌐 Power ▼
4. Power	🌐 500 ▭
5. Intensity	🌐 0 ▭
6. Iris	🌐 3 ▭
7. Lamp History	
8. Change Lamp	

New serial# entry automatically updates Lamp History...

Lamp S/N [＿＿＿＿]

...and resets Lamp Hours to "0"

Lamp History	
S/N	Hours
5679	1001
1234	0
IMPORTANT: If you neglect to enter a serial number, the lamp timer will not reset to "0" and will therefore be inaccurate. The lamp life limit may then expire prematurely.

4.5 Replacing the Projection Lens

A variety of lenses can accommodate different throw distances and specific types of installations. Refer to Section 6 - Specifications for details. To change a lens, follow the steps below. No tools are required for "compact" lenses shown.

STEP 1

TURN OFF THE PROJECTOR, COOL AND UNPLUG

NOTE: *If necessary, a lens can be swapped out while the projector is running, but this can result in dust being drawn into the projector. Avoid if possible.*

Before removing or installing any lens, turn off the projector and allow the fans to cool the lamp before unplugging the projector. Ensure that the lens cap is on.

⚠ **WARNING** ⚠
Unplug the projector.

Lens release

Lens retainer ring
Projection Lens*

Connector assembly (on lens)
Floating connector assembly
(on lens mount)
Figure 4.6. Lens Assembly

STEP 2

Install the lens cap and press the lens release button. See Figure 4.7.
Figure 4.7. Depressing Lens Release

STEP 3

ROTATE THE LENS

Rotate the lens counter-clockwise until the tabs are free from the lens retainer ring. See Figure 4.8A.

NOTE: *The connector slide assembly allows the connector to move as the lens is rotated.*

STEP 4

PULL LENS OUT
Lens connectors will disconnect when you pull the lens straight out from the projector. See Figure 4.8B.
Figure 4.8. Rotating the Lens

STEP 5

INSERT NEW LENS
NOTE: *Remove small rear cap! Keep front cap on.*

- *Electrical connector:* Line up male connector on the lens with the female connector on the connector slide assembly.
- *Insert lens:* Align the tabs on the lens plate lock with the slots in the lens retainer ring. Push the lens in approximately ½ inch.
- *Rotate the lens:* Rotate the lens clockwise until the tabs are tightly secured and the lens release button CLICK.
- *Secure lock-down screws (optional):* For added stability, secure the adjustment screws provided on the lens-retaining ring (see Figure 4.9). If you have installed a large zoom lens, one or more of the screws may be inaccessible—simply tighten those that are accessible (Figure 4.10).
Figure 4.9. Adjustable Screws on Retaining Ring

NOTE: *Recommended for heaviest lenses such as 0.73:1 and 1.2:1.*

STEP 6

POWER UP
Remove the lens cap and power up the projector.

STEP 7

REPOSITION THE PROJECTOR FOR NEW LENS
Reposition the projector closer or further from the screen as necessary for the screen and the new lens type – refer to lens descriptions in *Section 2, Section 6 and Appendix C, Throw Distance.* In a permanent installation, always use the appropriate throw distance formula to calculate the best position for the projector.
Figure 4.10. View with Zoom Lens installed

KEYPAD REFERENCE

NOTE: *The IR remote is a standard component provided with the projector. Use the extension cable also provided to convert the IR remote to a wired remote, if desired. Refer to* **Section 3** *for a specific description of each key and how to use them correctly.*

Test
• *Display a test pattern*

Power*
• *Turn projector ON or OFF*

Inputs
• *Display from this source*
NOTE: If PIP is on, Input keys affect the PIP window only.

PIP
• *Turn picture-in-picture ON or OFF*

Menu*
• *Display menus (toggle)*

Arrow Keys
• *Adjust a setting up or down*
• *Navigate within a menu*

Channel
• *Select channel (setup)*

Laser
• *Activate laser pointer at front of keypad*

Gamma
• *Adjust mid-range levels*

Number Keys
• *Enter a number, such as channel, value, etc.*
NOTE: Can be set to select inputs if desired.

Shutter*
• *Open or close the shutter*

Quick Setup
• *Optimize image automatically*

Lens Functions
• *Use ◀ and ▶ keys to adjust parameters*

OSD*
• *Use to hide or show menus*

Exit
• *Return to previous menu level*

Enter
• *Select a highlighted menu item; change or accept a value*

Projector
• *Select a projector in multi-projector installations*

Bright
• *Adjust amount of light in image*

Contrast
• *Adjust difference between light / dark*

Func
• *Enter special code such as color enabling*

Help
• *Display context-sensitive help (toggle)*

Press *and hold* to toggle or press twice to toggle or press and *release*, followed by ▲ ON or ▼ OFF

* Toggle keys, which require you to either, press and hold, or press twice or press and use the up/down arrow key.

SERIAL COMMUNICATIONS

A serial link of RS232 or RS422 enables ASCII communication with the projector so that it can be controlled remotely from a PC or other controller. From a PC, connect a standard nine-wire RS232 serial cable to the **RS232 IN** port. Or, for long-distance (>100 ft.) links with an RS422-compatible PC or controller, connect RS422 cable to the **RS422** port.

❏ *From projector to computer (RS232)*
For computers having a 9-pin "AT" type serial port

Standard RS232 cable, with 9-Pin D-connectors
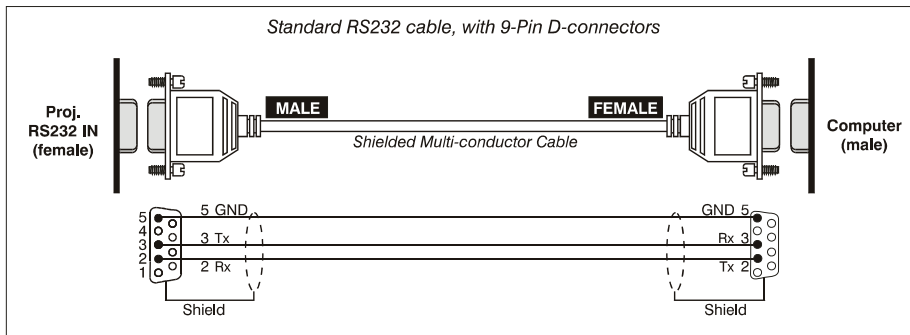

❏ *From projector to RS422 compatible computer*

5	TXD+	9	+12V
4	RXD+	8	n/c
3	TXD-	7	GND
2	RXD-	6	n/c
1	n/c		

Wiring

• *Wiring from your controller (or RS232-to-RS422 adapter) may vary. Consult the documentation for your device.*
• *Connect Tx+ to Rx+*
• *Connect Tx- to Rx-*
• *Connect Rx+ to Tx+*
• *Connect Rx- to Tx-*

1. Overview

Overview

This document describes how to use ASCII text communications to control one or more of the following Wolf Cinema projectors from a remote location:

- DCX-500i
- DCX-500FD
- DCX-1000i
- DCX-1000FD
- DCX-1500i
- DCX-1500FD

CONNECTION and USE: Once you have connected your computer to either the **RS232 IN** or **RS422 IN** port (depending on which standard is supported by your computer) or to the **ETHERNET** port on a projector listed above, you can remotely access projector controls and image setups, issue commands or queries, and receive replies. Use these bi-directional messages to:

- Control multiple projectors
- Obtain a projector's status report
- Monitor sequences of events
- Diagnose performance problems

NOTES: *1) Refer to the User's Manual provided with the projector for all cable requirements and other connection details. 2) Some commands are operational only when projector is powered up.*

2. Understanding Message Format

Understanding Message Format

All "remote control" information passes in and out of the projector as a simple text message consisting of a three letter command code and any related data. Opening and closing round brackets (parentheses) surround each message as shown below. Messages can be a command to *set* a projector parameter at a specific level, such as changing to a certain channel. Or the controller can *request* information, such as what channel is currently in use—the projector then returns the data in a *reply* message. Regardless of message type or origin, all messages use the same basic format and code as shown here.

	Message Format	Function	Examples
From Controller	(Code Data)	**SET** *(set channel to 24)*	(CHA 24) or (CHA24)
	(Code ?)	**REQUEST** *(what's current channel?)*	(CHA?)
From Projector	(Code ! Data)	**REPLY** *(channel is 24)*	(CHA!24)

Figure 1. The 3 Message Formats (SHADED MESSAGE IS FROM PROJECTOR)

Where applicable, a message may expand to include additional parameters of related details. And, if desired, you can choose to include optional information such as acknowledgements, checksums, and network addressing.

2.1 Basic Message Structure

BASIC MESSAGE STRUCTURE
The following component fields comprise a standard ASCII message. Optional fields, such as extra characters for special modes, restrictions or added functionality, are shown in shaded areas.

START **AND** **END** **OF MESSAGE:** Every message begins with the left "("character and ends with the right ")" character. Note that if the start character is received before an end character of the previous message, the partial (previous) message is discarded.

PREFIX CHARACTERS (OPTIONAL): For acknowledgement that the projector has responded, and/or to maximize message integrity, insert one or two special characters before the 3-character function code:
- *$ Acknowledgment. See 2.4, Maximizing Message Integrity*
- *& Checksum. See 2.4, Maximizing Message Integrity*

FUNCTION CODE: The projector function you wish to work with, such as channel selection or gamma, is represented by a three-character ASCII code (A-Z, upper or lower case). This function code appears immediately after the leading "(" that starts the message. In messages sent to the projector, a space between the function code and the first parameter (or special character) is optional.

REQUEST/REPLY SYMBOLS: If the controller is *requesting* information from the projector, a "?" question mark appears directly after the function code. If the projector is *replying*, a "!" exclamation mark appears directly after the function code. For set messages to the projector, neither of these characters appear—the code is followed by the data itself (see next).

OTHER SPECIAL FUNCTIONS (OPTIONAL): To add functionality to the current message, include one or more of the following special characters between the function code and first parameter. If more than one (M SP), add in any order.

- *A Auto Mode adjustment (rare—for video standard selection only). See 2.6, Other Special Functions*
- *E Enable Control Inquiry. See 2.6, Other Special Functions*
- *G Global Control Inquiry. See 2.6, Other Special Functions*
- *H Return the Help text for a control. See 2.6, Other Special Functions*
- *I Used as an index for controls containing many values. See 2.6, Other Special Functions*
- *K Keypad emulation. See 2.6, Other Special Functions*
- *L Return a list of options for 'list' controls. See2.6, Other Special Functions*
- *M Find min/max adjustments (i.e., range). See 2.6, Other Special Functions*
- *N Return the name of the control. See 2.6, Other Special Functions*
- *S Adjust a specific source setup only. See 2.6, Other Special Functions*
- *T Return the type of control (i.e. Slidebar etc.). See 2.6, Other Special Functions*
- *P Adjust image in PIP window. See 2.6, Other Special Functions*

DATA: The value for a given projector state, such as "on" or "off", appears in ASCII-decimal format directly after the request/reply symbol. You can add an optional space after the symbol—i.e., before the data—in a *set* message, but data in *replies* follow the "!" symbol without a space. Other details to remember about data:

- All values returned by the projector (reply messages) have a fixed length of either 3 or 5 characters regardless of the actual value—the value is padded with leading zeros as necessary.
- Data in set messages to the projector does not require padding with zeros.
- For any given parameter, data is always the same number of characters. E.g., the **shutter** value, which is either "on" (1) or "off" (0) is always 3-digits: 001 or 000.

- Within each message, multiple parameters of data must be separated by one "**space**" character.
- Data pertaining to a source setup other than the current source setup is preceded by: the letter "S", the source setup number (i.e., channel), and a space. This is similar to an "extra" parameter P0.
- Text parameters such as channel names are enclosed in double quotes following the data, as in "Name".

TEXT PARAMETERS: Most data is simply a numerical value, however some messages also require text. For example, a **channel naming** message typically includes a text-based name after the channel number—enclose this text in double quotation marks, as in "Tilt the Wagon". Use all characters as desired except for the following special characters shown in the left column below—these require a 2-character combination as shown:

Special Characters for Text

If you want this...	Enter this...	Description
\	\\	Backslash
"	\"	Quote
(	\(	Left bracket
)	\)	Right bracket
0x01	\b	Start of binary message (control code)
0x0A	\n	New line - if the text can be displayed on more than one line, this will set the line break.
0x1B	\x	Control code (ESC)
0x0E	\e	End of binary message (control code)
0x11	\g	Xon (control code)
0x13	\s	Xoff (control code)

2.2 Sampling Messages and Their Meaning

SAMPLING MESSAGES AND THEIR MEANING

Desired Action	Message	Description
Get current Chan#	(CHA?)	Request by controller for current channel #
Chan# reply from proj.	(CHA!24)	Reply from proj. that current channel is 24
Set Chan#	(CHA 24)	Switch to the first channel on the TPC
Get on-screen display status	(OSD?)	Request by controller for OSD state.
On-screen display is disabled.	(OSD!000)	Reply from proj. that menus are not displayed
Set on-screen display to ON	(OSD 1)	Turn the menu system on.

• For Single Projector
• For Broadcasting

Message Format	Function	Examples
(Code Data)	**SET** *(set contrast to 64)*	(con64)
(Code ?)	**REQUEST** *(what's current contrast?)*	(Con?)
(Code ! Data)	**REPLY** *(contrast is 64)*	(CON!064)
($ Code Data)	**SET AND ACKNOWLEDGE MESSAGE** *(message processed?)*	($con64)
(& Code Data *space* Checksum)	**SET WITH CHECKSUM**	(&CON64 240)

• For Specific Projector Within a Network
• 1 Controller Present

Message Format	Function	Examples
(Dest. Addr. Code Data)	**SET** (turn proj.#5 on)	(5pwr1)
($ Dest. Addr. Code Data)	**SET AND ACKNOWLEDGE MESSAGE** *(message processed?)*	($5pwr1)

• For Specific Projector Within a Network
• Multiple Controllers Present

Message Format	Function	Examples
(Dest. Addr. *space* Src. Code ?)	**REQUEST** *(get contrast from proj. #5 to controller #2)*	(5 2con?)
($ Dest. Addr. *space* Src. Code Data)	**SET AND ACKNOWLEDGE MESSAGE** *(is message from controller #2 processed by proj. #5?)*	($5 2con?)
($ Dest. Addr. *space* Src. Code Data)	**REPLY** *(from proj. #5 to controller #2: contrast is 64)*	(002 005CON!0(

2.3 What is Actually Sent in a Message

WHAT IS ACTUALLY SENT IN A MESSAGE
Although you will send and read messages as strings of ASCII characters, the actual message travels as a sequence of bytes. Each character in this sequence requires 1 byte. See example below, which illustrates a "lamp limit is 2000 hours" reply from the projector.

ASCII =	(	L	P	L	!	2	0	0	0	)
HEX =	0x28	0x4c	0x50	0x28	0x21	0x32	0x30	0x30	0x30	0x29

ASCII as Hex

2.4 Maximizing Message Integrity

MAXIMIZING MESSAGE INTEGRITY
For additional reassurance and/or maximum message integrity, you can insert one or two special characters:

ACKNOWLEDGMENTS: If you want assurance from the projector (or group of projectors) that a set message has been processed, request this simple acknowledgment by inserting a "**$**" just after the start code "**(**". When the projector executes the required action (such as a source switch, for example), the projector will send a "**$**" (only) back. This is a quick way to confirm success with *set* messages, and is particularly useful with long-distance communication links or where the projectors and/or images are not visible from the controller. Acknowledgements can also be a type of flow control. Note that requesting an acknowledgement serves no purpose when included in a *request* message, since the acknowledgement will be redundant to the actual reply from the projector. However, if requested, the "**$**" acknowledgement from the projector will follow the reply.

Simple Acknowledge from Projector
CHECKSUMS: For maximum message integrity, add a checksum character "**&**" just after the "**(**" as shown below. You must then also include the correct checksum total (0-255) just before the "**)**" end code. Make sure to add a space before the calculated checksum to separate it from the last data parameter:

<div align="center">

(&con64 240)

</div>

The checksum is the low byte of the sum of the ASCII values of all characters between the "**(**" and the beginning of the checksum. Calculate the checksum for the above "set contrast to 64" command as follows:

CHECKSUM EXAMPLE
$= \& + c + o + n + 6 + 4 + \text{'space'}$
$= 26h + 63h + 6Fh + 6Eh + 36h + \$34h + \$20h$
$= 01F0h$
$= F0h$ when only the low byte is used
$= 240$

The projector collects all of the message bytes as defined in the first byte of the message, then creates its own checksum value for comparison with the checksum included in the controller's message. If the values match, the message is considered to have been correctly received—otherwise the message is discarded.

NOTES: 1) *'h' indicates a hex number.* **2)** *If a "request" message has a checksum so will the reply.* **3)** *If using both "acknowledge" and "checksum", either character can occur first.*

2.5 Accessing Specific Source Setups

ACCESSING SPECIFIC SOURCE SETUPS
For ASCII messages described in this document, it is assumed you are adjusting the current source setup (channel) rather than a different specific one. However, for several commands (for example, ASR, *Auto Source*) you can direct the message to particular source setup. To do this, insert an "**S**" and a source# (such as "S5") before the parameter value—the source setup number can be thought of as a "P0" parameter prior to the first parameter, and can be preceded with an optional space. For example:

      (ASR S25 1)   = Turn Auto-Source on for source setup #25

Use "S0" if your setting should be applied to all source setups (channels):
      (ASR S0 1)   = Turn Auto-Source on for all source setups

The "S" source setup function cannot be used for parameters affecting the projector as a whole such as projector address.
      Other Examples:
      (ASR 1)   = Turn ASR on for the current source setup
      (ASR? S5)   = What is the ASR status for source setup #5?
      (ASR!S005 001) = ASR is on for source setup #5
      (ASR? S7)   = What is the ASR status for source setup #7?
      (ERR 006 "ASR: Source does not exist")   = Source setup #7 does not exist
      (ASR?)   = What is the ASR status for current source setup?
      (ASR!000)   = ASR is off for current source setup

2.6 Other Special Functions

OTHER SPECIAL FUNCTIONS
To add functionality to a message, include one or more of the following special characters directly after the start code "(". If you add more than one, they can be in any order.

PARAMETER LIMITS: For single-parameter projector function codes, you can find out the current range of adjustment by adding the letter "**M**" to your *request* message. For example:
      (LPL?M)   What is the minimum and maximum lamp limit?
      (LPL!M000 5000)   Minimum lamp limit = 0, maximum lamp limit = 5000.

Ranges cannot be determined in this manner if the function has multiple parameters. Note also that for text-based parameters, the "M" values represent the shortest and longest text strings possible.

"AUTO" MODE: For certain projector functions, you can add the letter "**A**" to your set message if you want software to choose the appropriate setting. A *reply* with an "**A**" indicates that the choice was auto-selected. For example:
      (STD A)   Set the video standard to the most appropriate option.
      (STD?)   What is the current video standard?
      (STD!A4)   The video standard was automatically set to option 4 (such as PAL-M).

Note that in these projectors, auto mode is supported *only* for selecting a video standard. Although other functions (such as Motion Filter) may offer an "Auto" choice in its list of options, a reply message from the projector will not include "A" to indicate that "Auto" it is selected—auto is simply an option chosen like any other.

ADJUSTING A PIP IMAGE: When there are two images on screen, all messages affect the primary image—that is, the larger "background" image. To direct a message to the PIP window instead, add the letter "**P**" to your set message. For example:
      (CON P47)   In the PIP window, set contrast to 47.
      (STD? P)   What is the current video standard used in the PIP window?

HELP TEXT: To have the Help Text for a specific command returned as a reply from the projector, add the letter "**H**" to your *request* message. For example:

    (CON?H)   What is the help text for the Contrast Control?
    (CON! "The Contrast is crushed"**)**   Reply from the projector.

GLOBAL INQUIRY: Add the letter "**G**" in your *request* message to find out if the control is global. A reply of "001" is returned if the control is global. For example:

    (BDR?G)   Is BDR a global control?
    (BDR!001)   BDR is a global control.

INDEX VALUE: When a control uses indexes for multiple values, insert an "I" into your request message to fin out the specific value of the index parameter. For example:

    (BRU? I22)   What is the value for White Field Uniformity specified by index 22?
    (BRU! 123)   The value is 123 for index 22.

ACCESSING A LIST: For a control with a list of available options, add the letter "L" to your request message to get a reply of the available options in that list control in the order they appear in the menu. The reply message includes the following four parameters:

P1=1, item selectable
P2=1, item displayable
P3=value of item
P4=text for item

<u>**Examples:**</u>

    (STD?L)   What are the list options for the STD list control?
    (STD!L001 001 00008 "Auto")
    (STD!L001 001 00007 "NTSC")
    (STD!L001 001 00003 "NTSC4.43")
    (STD!L001 001 00000 "PAL")
    (STD!L001 001 00004 "PAL-M")
    (STD!L001 001 00005 "PAL-C")
    (STD!L001 001 00006 "PAL-60")
    (STD!L001 001 00002 "SECAM")
    (STD!L001 001 00009 "?")
    (STD!L111 "—END—")

The end of the list is marked with P1=111. You can also access the text for a specific item in that list by adding the value of that item after the **L**. For example:

    (STD?L4)   What is the text for item for in the Video Standard list?
    (STD!L001 001 00004 "PAL-M")

CONTROL NAME: To find out the name of the control you are using, add the letter "**N**" to your *request* message. If the control uses indexes for multiple values, insert the index number after the "**N**" to read the name of the index. For example:

    (CON?N)   What is the name of the CON control?
    (CON! "Contrast")
    (BRU?N2)   What is the name for index parameter 2 for BRU?
    (BRU! "Left Side, R")
    (BRU?N6)   What is the name for index parameter 6 for BRU?
    (BRU! "Top Left Corner, R")

CONTROL TYPE: To find out the type of control it is that you are using, add the letter "**T**" to your *request* message. If indexes are being used for control with multiple values, insert the index parameter after the "**T**" to find out the type of control that the index is. For some slide bar or number controls, an additional parameter may be returned to specify the number of decimal places the control uses and if the control is to be displayed as a percentage (0=min and 100=max). If the *reply* message does not contain the letter "**T**", than this function is invalid for that control.

The parameters for control types are:

0 = Special Format	**5 = Text**
1= Slide Bar	**6 = "Reserved Control"**
2 = Checkbox	**7 = Date**
3 = List	**8 = Time**
4 = Number	**9 = IP (dotted quad)**

<u>**Examples:**</u>

(STD?T)	What type of control is STD?
(STD! T003)	STD is a List.
(CON?T)	What type of control is CON?
(CON! T001 %000)	CON is a slidebar that is currently at 0%.
(EBB?T8)	What type of control is index parameter 8 of EBB?
(EBB! T004 237)	EBB is a number control and it's current value is 237.

ENABLE INQUIRY: Add the letter "**E**" in your *request* message to find out if the control is enabled in the current context. A reply of "001" is returned if enabled. If the control has and index for multiple values, that index should be used to read the enable status.

(STD?E)	Is STD enabled in the current context?
(STE!E001)	STD is enabled.

KEYPAD EMULATION: Add the letter "**K**" in your *set* message to change to a quick "keypad mode" within the message. The next value in the message now represents the adjustment of the parameter.

K0	Stop the adjustment
K1	Toggle check box state
K2	Start decreasing a value, or moving the current image left/up
K3	Start increasing a value, or moving the image right/down

<u>**Examples:**</u>

(LHO K2)	Start moving the image left
(LHO K0)	Stop moving the image horizontally
(FRZ K1)	Freeze or unfreeze the image on the active window

Keypad emulation is required in APR, FCS, LHO, LVO and ZOM messages set messages.

2.7 Flow Control

FLOW CONTROL

Normally messages can be sent to the projector before processing of earlier messages is complete—the projector will just store messages in a buffer until ready to process. However, if a series of messages is sent it is possible that the projector may not be able to process them as fast as they arrive and the buffer will become full. If this happens, the projector will send the 13*h* (Xoff) code to instruct the controller (or any devices preparing to transmit) to cease transmission. At this point, the controller must respond immediately and send no more than 10 extra characters or they may be lost (i.e., the projector is able to accommodate the receipt of up to 10 more bytes after it sends 13*h* [Xoff]). When the buffer is once again available, the projector will send a 11*h* (Xon) command to resume transmission.

NOTE: *Xon and Xoff controls apply to both directions of communication. The projector will not send more than 3 characters after it has received a 13h (Xoff) code.*

FLOW CONTROL WITH "ACKNOWLEDGE": If the controller waits for each message to be acknowledged before sending the next and the controller does not send a message that is longer than 20 characters, then the projector will never send an Xoff and the controller does not have to handle them. If the projector has not received an Xon after receiving an Xoff code, after a time out it will assume that the Xon was lost and start transmitting again. If the controller has received an Xoff and no Xon within a reasonable time, it can assume that the Xon was lost. These two time outs are projector-specific and are in the range of 3s-60s.

3. ASCII Codes

ASCII Codes

This section lists all ASCII message codes for controlling the projectors listed on page 3. To fully understand how an adjustment works or what it does in the projector and/or image, always consult the User's Manual provided with your projector.

General Notes to Remember:

* When a parameter for a specific source setup is accessed (see 2.5 Accessing Specific Source Setups) an "S" is inserted between the command code (space) and P1 (no space
* The smallest increment for adjusting any parameter is always 1.
* For some controls (Contrast, e.g.), the value displayed on the screen is a percentage while the actual hardware has a range of 0-255. In these cases, remember that ASCII values are correlations to the screen values, and will not match numerically (ASCII 0 = 0%, ASCII 128=50.2%, etc.).

3.1 ACE
Auto Color Enable

ACE AUTO COLOR ENABLE
Use to automatically project a specific color or colors when working with controls such as Input Levels, Odd Pixel Adjustment, Color Temp Adjust adjustments, etc.

3.2 ADR
Projector Number

ADR PROJECTOR NUMBER
ADR identifies or sets the projector's assigned number (0-999) so that it can be controlled separately within a group of linked projectors. To change the Ethernet IP address via ASCII, see XIP.

3.3 AGC
Automatic Gain Control

AGC AUTOMATIC GAIN CONTROL
AGC automatically tracks the sync amplitude of the incoming signal.

3.4 AIL
Auto Input Levels

AIL AUTO INPUT LEVELS
AIL allows the projector to continuously monitor the input signal levels and make adjustments as necessary to prevent crushing.

3.5 APJ
Active Projector

APJ ACTIVE PROJECTOR
Use APJ to temporarily disable (0) or enable (1) the IR and Wired Keypad inputs to a specific projector in a network of projectors. APJ is essentially the same as using the ⬭Proj⬭ key, and is best understood as a way of changing a projector's listening status even though ⬭⏻⬭ and ⬭Proj⬭ still work. **NOTES: 1)** *APJ does not affect the built-in keypad.* **2)** *An APJ to disable the keypad does not change the state of the Communications menu checkboxes for Front IR, Rear IR, Wired Keypad—these will remain checked (on).* **3)** *The keypads revert to "enabled" after a power-down, or if the projector is unplugged and plugged in again.*

3.6 APR
Iris

APR IRIS
Used APR to adjust the Iris size from 0-9. Raise to improve contrast, lower to improve brightness.

> (APR K2) - start increasing the aperture size (higher brightness)
> (APR K3) - start decreasing the aperture size (higher contrast)
> (APR K0) - stop changing the aperture size

To "nudge" the aperture size, script in a delay between (APR K3) and (APR K0). Depending on your application, a delay of at least 20-30 milliseconds may be sufficient.

3.7 APW
Auto Power Up

APW AUTO POWER UP
Set APW to automatically power up (1) or remain off (0) after a power failure.

3.8 ARO
Aspect Ratio Overlay

ARO ASPECT RATIO OVERLAY
This is a function used when setting up the projector. When turned on (1), it overlays a number of common aspect ratio boxes on top of the source image. Turning off the overlay (0), will return to your source image.

3.9 ASR
Auto Source

ASR AUTO SOURCE
Use ASR to automatically select a particular source setup (P1= S1-50) when switching channels. Enable (P2=1) or disable (P2=0) this function as desired. See section see 2.5 Accessing Specific Source Setups.
NOTE: In an ASR reply, on/off state is P3 and the availability of the source setup is P2. See below.

3.10 ASU
Quick Setup

ASU QUICK SETUP
Use ASU to do a Quick Setup of optimized settings based on the incoming signal detected.

3.11 BBL
Bottom Blanking

BBL BOTTOM BLANKING
Use BBL to blank (turn to black) the bottom of the image. Range depends on the incoming signal.

3.12 BDR or BDS
Baud Rates

BAUD RATES
BDR: Set the RS232 (only) baud rate to 1200, 2400, 9600, 19200, 38400, 57600 or 115200. Omit the "00" if desired.
BDS: Set the RS422 (only) baud rate to 1200, 2400, 9600, 19200, 38400, 57600 or 115200. Omit the "00" if desired.

Wait at least 2s before sending the first message at the new rate. A reply returns a 7-digit value: the complete number, plus leading zeros (see below). An invalid setting will trigger an error message.

> <u>Examples:</u>
> bdr96)   Set the RS232 baud rate to 9600
> (bds38400)   Set the RS422 baud rate to 38400
> (BDR?)   What is the current RS232 baud rate?
> (BDR!0019200)   The current RS232 baud rate is 19200
> (BDS!0115200)   The current RS422 baud rate is 115200

3.13 BGC
Gamma Curve

BGC BASE GAMMA CURVE
Select the base gamma curve. "0" represents the default 2.2 curve, 1-21 are user-defined Arbitrary Gamma Curves.

3.14 BKL
Backlight

BKL BACKLIGHT
Turn the built-in keypad backlighting off (0) or on (1).

3.15 BKY
Broadcast Keys

BKY BROADCAST KEYS
Enable (1) or disable (0) broadcasting of commands to all projectors on a network.

**3.16 BLB
Blue Blacklevel**

BLB BLUE BLACKLEVEL
Set or request the blue Blacklevel (0-511) for a specific source setup.

**3.17 BLD
Blue Drive**

BLD BLUE DRIVE
Set or request the blue Drive (0-511) for a specific source setup.

**3.18 BOG
Blue Odd Gain**

BOG BLUE ODD GAIN
Set or request the blue Odd Gain (0-255) for a specific source setup. You can set an Odd Gain value for two separate analog input paths. The first input path is Input 1 (BNC connectors). The second input path is one of: Input 2 (DVI-A connector), or Input 5 or Input 6 (one of the analog option cards).
To leave one of the input values unaffected, enter a value of 0 for the input. If only one value is specified, then both input paths will have the same value.
Examples:
(BOG 130 135) Sets the BNC analog path to 130, the DVI/option card path to 135. (BOG 0 120) Leaves the BNC path as it was, the DVI/option card path to 120. (BOG 125) Sets both paths to 125.

**3.19 BOO
Blue Odd Offset**

BOO BLUE ODD OFFSET
Set or request the blue Odd Offset (0-255) for a specific source setup. You can set an Odd Offset value for two separate analog input paths. The first input path is Input 1 (BNC connectors). The second input path is one of: Input 2 (DVI-A connector), or Input 5 or Input 6 (one of the analog option cards).

To leave one of the input values unaffected, enter a value of 0 for the input. If only one value is specified, then both input paths will have the same value.

**3.20 BRT
Brightness**

BRT BRIGHTNESS
Set the image brightness from 0-1000. The BRT value represents a percentage, e.g. 1000=100.0 % or 0505=50.5%.

**3.21 BRU
White Field Uniformity**

BRU WHITE FIELD UNIFORMITY
Use BRU to adjust light output in the 8 zones around the central zone in the image, and/or to turn BRU on/off. To find out if BRU is on, send a request with no parameters. The reply will be "off" (0) or "on" (1).

Examples:
(BRU 2 0 65)	Set right red zone to 65.
(BRU 5 G 24)	Set top left green zone to 24.
(bru? 0 B)	What is the overall brightness of blue?
(bru! 0 B 039)	The overall brightness of blue is 39.
(BRU 1)	Enable White Field Uniformity feature (if feature is available).
(bru?)	What is the status of the Uniformity Enable feature/checkbox?
(bru! 1)	White Field Uniformity is Enabled.

Parameter	Description	
P1 = Where to adjust? *or* (if Wolf WARP and no other parameters)P1 = Which type of White Field Uniformity	0 = Overall 1 = Left 2 = Right 3 = Top 4 = Bottom	5 = Top Left 6 = Top Right 7 = Bottom Left 8 = Bottom Right
	If Wolf WARP and no P2 or P3 parameters, P1= 0 = Disable 1 = Enable normal White Field Uniformity 2 – 4 = User-defined White Field Uniformity (requires s/w v1.1 or higher)	
P2 = Which color to adj.	0 or R = Red 1 or G = Green 2 or B = Blue	
P3 = Setting	0 – 255 for "Overall" and 0 – 127 for all other zones	

3.22 BUS White Field Uniformity Select

BUS WHITE FIELD UNIFORMITY SELECT

This enables or disables White Field Uniformity. If a WARP module is installed the control changes to a list and allows several different uniformity maps to be selected.

Without Wolf WARP Module: 0 = disabled, 1 = enabled

With Wolf WARP Module: use the (BUS?L) request to read the list.

3.23 CCA Comprehensive Color Adjustment

CCA COMPREHENSIVE COLOR ADJUSTMENT

Use the CCA service function to change the factory-set native colors (Max Drives) in the projector, or to define one or more custom color palettes (i.e., color gamut). CCA changes x/y coordinates for red, green, blue and white points for a given gamut. Can be applied with CCS command.

NOTE: *Remember that Max Drives represents the measured native colors of the projector, and that all color performance depends on these native colors. A new CCA for Max Drives will change **all** color performance and gamut (palettes).*

Parameter	Description	
P1 = Which gamut (palette) to adjust.	0 = This is a duplicate of 1 (Max Drives)	
	1 = Max Drives 2 = Color Temperature** 3 = SD Video* 4 = HD Video*	5 = User 1 6 = User 2 7 = User 3 8 = User 4
	* **NOTE:** *Factory-set to industry standards. Adjustment is not recommended as it will change this performance standard.*	
	* *Affects only the current color temperature setting. Changing Color Temp coordinates with CCA is not recommended.*	
P2	Red x	
P3	Red y	
P4	Green x	
P5	Green y	
P6	Blue x	
P7	Blue y	
P8	White x	

P9	White y
P10	Magenta x
P11	Magenta y
P12	Cyan x
P13	Cyan y
P14	Yellow x
P15	Yellow y

Examples:
(CCA?)   = What is the current color adjustment?
(CCA 1 661 341 332 575 144 93 320 330)   = Set "Max Drives" to these x/y coordinates

**3.24 CCC
Comprehensive Color
Clear**

CCC COMPREHENSIVE COLOR CLEAR
The CCC command will copy the data from one of the comprehensive color setups into the currently selected user setup (USER1-4). See CCS for a list of possible selections.

**3.25 CCI
Color Temperature**

CCI COLOR TEMPERATURE
Use CCI to implement a color temperature from 3200K-9300K. This control changes just the white point (x/y) of the current gamut, and is applied only if you are using color temperature (CCS) as your "Select Color Adjustment" choice.

**3.26 CCS
Select Output Color**

CCS SELECT OUTPUT COLOR
Use CCS to select a predefined or user-defined color palette for use with a given source.
0 = Max Drives (default) 1 = Color Temperature 2 = SD Video 3 = HD Video 4 = User 1 5 = User 2 6 = User 3 7 = User 4

**3.27 CHA
Channel Select**

CHA CHANNEL SELECT
Use CHA to select a channel (1-99). This is the same as SRC command.

**3.28 CLE
Color Enable**

CLE COLOR ENABLE
Enable a specific color to be projected on the screen (1=red, 2=green, 3=blue, 4=yellow, 5=cyan, 6=magenta, 7=white, 8=black). **NOTE:** *Colors will always revert to white (full color) upon power-up and if "Exit" at presentation level.*

**3.29 CLP
Clamping**

CLP CLAMPING
Use CLP to define the blacklevel clamping location for the current signal (0 = Sync Tip, 1 = Back Porch, 2 = Tri-level).

**3.30 CLR
Color**

CLR COLOR
Set the color intensity (1-1000) for video images. The CLR value represents a percentage, e.g. 1000=100.0 % or 0505=50.5%.

**3.31 CON
Contrast**

CON CONTRAST
Use CON to set the contrast level (0-1000). The CON value represents a percentage, e.g. 1000=100.0 % or 0505=50.5%.

3.32 CRM
Chroma / Luma Delay

CRM CHROMA / LUMA DELAY
Use CRM to set the time delay (20-50) between the chroma and luminance in decoded signals.

3.33 CSP
Color Space

CSP COLOR SPACE
CSP specifies which color space the input signal uses. 0=RGB, 1=YprPb, 2=YPbPr (HDTV).

3.34 DEF
Factory Defaults

DEF FACTORY DEFAULTS
Use DEF to reset all parameters in the projector to factory defaults—all source setups are deleted, all factory-defined color palettes are restored, and all user adjustments/preferences are set to default values. DEF may also change your baud rate and projector number. **NOTE:** *You must include P1 = 111 in any DEF message. This requirement prevents accidental use of DEF.*

Because the DEF message can take a fairly long time, it is a good idea to include the optional Acknowledge code ($) to determine when the defaults have been completed—i.e., ($def 111).

3.35 DLS
Delete Source

DLS DELETE SOURCE
Use DLS to delete a specific locked or unlocked source setup (1-50), or to delete all unlocked source setups (0). To delete all setups, even those that are locked, you must first unlock all source setups using the memory lock command (MLK S0 0).

3.36 DLY
Delay

DLY DELAY
Use DLY to delay a real-time event for a number of milliseconds (1-65535ms).
Example:
(RTE G 5 H "(DLY 100) (PWR 0)") = When pin 5 goes high, Delay 100ms, then power off.

3.37 DRK
Dark Interval

DRK DARK INTERVAL
Use DRK to control the time interval—in active output lines—between frames projected to the screen, so that active 3D applications are well-synchronized with shutters in 3D glasses. Range depends on source frequency. For 3D models only.

3.38 DTA
Source Data

DTA SOURCE DATA
Use DTA to read from the projector (or load into the projector) all of the settings related to a specific source setup (1-99), or pertaining to system parameters. This essentially creates a back-up. If a source setup does not exist, use DTA to define all settings for it. This essentially creates a back-up.

Keep in mind that a DTA request triggers reply messages for each setting in a source setup. Because of the large number of replies, requesting an acknowledgement from the projector ($) is a good idea—receiving the ($) back confirms that the projector has returned all data and completed the full DTA reply.

<u>**READING SETTINGS (DATA) FOR A SPECIFIC SOURCE SETUP**</u>

Message	the number of the source setup to read – must have leading 'S':
	For example, ($DTA? S5)
	If P1 = source#1-99, this identifies a specific source setup to read
Reply	P1 = the number of the source setup being read (1-99)
	P2 = switcher number (0=projector)
	P3 = slot number
	P4 = the vertical frequency (cHz)
	P5 = the horizontal frequency (10's of Hz)

P6 = input polarity & routing
> Bits 2-0 // horizontal sync source
>> 0 = no sync
>> 1 = horizontal on vertical input
>> 2 = horizontal on horizontal input
>> 3 = horizontal on green input
>> 4 = horizontal on red input
>> 5 = horizontal from Vid1 input
>> 6 = horizontal from Vid2 input
>
> Bit 3 // set if composite sync (H & V on same wire)
> Bit 4 // set if horizontal sync has negative polarity
> Bit 5 // set if vertical sync has negative polarity

Setting 1   = reply message for first source setup setting
Setting 2   = reply message for second source setup setting
Setting 3   = reply message for third source setup setting
           Etc…
Setting n   = reply message for last source setup setting
$ acknowledge of DTA message (if requested)

Example:
($DTA? S5)
> (DTA! S005 000 001 05996 03150 059)
> (CON! S005 045)
> (BRT! S005 167)
> Etc…
> $

READING SETTINGS (DATA) FOR ALL SOURCE SETUP

To request all settings for all sources, use P1=0 ($DTA? S0). The reply will be a sequence of replies for each source. If you requested an acknowledgement ($), it will arrive after the last reply for the last source.

Example:
($DTA? S0)
> (DTA! S005 000 001 05996 03150 059)setup
> (CON! S005 045)
> (BRT! S005 167)
> Etc.…
> (DTA! S034 000 001 05996 03150 059)
> (CON! S034 022)
> (BRT! S034 137)
> Etc.…
> $

DOWNLOADING SOURCE SETUP SETTINGS (DATA) TO A PROJECTOR

Send a DTA message to define a new source setup, or redefine an existing source setup, and include the specified parameters (refer back to the "Reading Setting for a Specific Source Setup" list of parameters shown above).

Example:
> (DTA S005 000 001 05996 03150 085)
> (CON S005 045)
> (BRT S005 167)
> Etc.…
> (DTA S034 000 001 05996 03150 085)
> (CON S034 022)
> (BRT S034 137)
> Etc.…

READING PREFERENCE SETTINGS

Settings for projector preferences are either Transferable or Projector-specific:

❑ *Transferable*: Valid for any projector of the same model. Single DTA parameter = T.
❑ *Projector-specific*: Unique to an individual projector. Single DTA parameter = P.

Example:

($DTA? **T**)	= Request for all preferences that can be used in other projectors of the same model

(BDR! 09600)
(LPI! 00345)
Etc.…
$

($DTA? **P**)	= Request for preferences that are unique to an individual projector

(CTM! 001 002 00000 000 01187)
(CTM! 002 007 05400 012 043)
Etc.…
$

DOWNLOADING PREFERENCES TO A PROJECTOR

To download preference settings to a projector, just send the various settings as separate commands—DTA is not used. Take special care when sending BDR (Baud Rate) and ADR (Projector # or Address) messages, as they change the way your network operates and you may accidentally break communication. For example, BDR should always be broadcast to all projectors or you will be unable to talk to some projectors.

3.39 DTL Detail

DTL DETAIL

Use DTL to set the detail for RGB and video images.

3.40 DTT Detail Threshold

DTT DETAIL THRESHOLD

Sets the minimum change required before the detail (DTL) function is activated. This sharpens images without increasing background noise.

3.41 EBB Edge Blending Black Levels

EBB EDGE BLENDING BLACK LEVELS

The EBB control is only active when Edge Blending (EBS) and Black Edge Blending (BEB) have been enabled. The particular edges that have been blended with the Edge Blending (EBL) command will be active for blending the black levels. For example, you cannot adjust the Edge Blend Black level for the top edge, if there is no edge blending active for the top edge. Similar to the EBL control, data can be specified by zones or edges, or by index.

Parameter	Value	Description
P1	1-16 (P1: 1-9 = blend edge/zone brightness) (P1: 10-13 = edge zone width) (P1: 14-16 = color components of overall black level)	1 = Center 2 = Top 3 = Bottom 4 = Left 5 = Right 6 = Top Left 7 = Top Right 8 = Bottom Left 9 = Bottom Right 10 = Left Width 11 = Right Width 12 = Top Width 13 = Bottom Width 14 = Black Red Level 15 = Black Green Level 16 = Black Blue Level
P2	When P1 = 1-9, P2 = 0-247 When P1 = 10-13, P2 = 0-255 When P1 = 14-16, P2 = 0-255	Brightness (0-247) Zone Width (0-255) Color Level (0-255)

Examples:

(BEB 2 15)	Set Brightness of top edge to 15
(BEB?)	Request state of Black Edge Blending
(BEB! 1)	Black Edge Blending is enabled

3.42 EBE
Edge Blending Black Levels Select

EBE EDGE BLENDING BLACK LEVELS SELECT
This command enables (1) or disables (0) the Black Edge Blending feature. This feature can only be enabled when Edge Blending has been enabled (EBS).

3.43 EBL
Edge Blending

EBL EDGE BLENDING
Use EBL to blend together the overlapping edges of adjacent images, and/or to turn EBL on/off. To find out if EBL is on, send a request with no parameters. The reply will be "off" (0) or "on" (1). Note that on-screen values do not match values through ASCII messaging.

Parameter	Description
P1 = Which blend edge? or (if Wolf WARP and no other parameters) **P1** = Type of edge blending to use.	0 = Left 1 = Right 2 = Top 3 = Bottom Or, if Wolf WARP and no P2 or P3 parameters, P1= 0 = Disable 1 = Enable normal Edge Blending 2 – 4 = User-defined custom blend (requires s/w v1.1 or higher)
P2 = Which blend characteristic?	0 = Width of blend 1 = Shape of blend 2 = Midpoint of blend
P3 = Setting	Left/Right Width = 0, 5-80, Top/Bottom Width 5-60, Shape 2-30, Midpoint 2-30

Examples:

(EBL 2 0 15)	Set width of top blend to 15
(EBL?)	What is the current status of Edge Blending—on or off?
(EBL! 1)	Edge Blending is currently enabled

3.44 EBO
Edge Blending Overlap

EBO EDGE BLENDING OVERLAP
Use EBO in conjunction with Edge Blending to simplify the aligning of edge-blended projectors. Enabling EBO (1) sets the blend region to a uniform gain of 25% and the rest of the image to 100%. Disable EBO (0) to restore previous gain settings.

3.45 EBS
Edge Blending Select

EBS EDGE BLENDING SELECT
This enables (1) or disables (0) edge blending. If a WARP module is installed the control changes to a list and allows several different edge blends to be selected. Use the (EBS?L) request to read the list.

3.46 EME
Error Message Enable

EME ERROR MESSAGE ENABLE
Use EME to turn all notification off, or to choose how you wish to be notified of projector errors.
   0 = Off
   1 = On-screen display
   2 = ASCII message (i.e., via ERR messages)
   3 = Both

3.47 ERR
Error Message

ERR ERROR MESSAGE
The projector broadcasts an ERR message when an error is detected. Each ERR message includes the error code (P1), error type (P2), and a text explanation. Error messages also include the address of the source projector.

NOTE: *The type of error and the text explanation are enclosed together in quotation marks, separated by a colon and a space. Below, the text explanation appears as -----.*

Error Code (P1)	Type of Error (P2)	Meaning
001	"System Error: -----"	System crash.
002	"System Warning: -----"	System error.
003	"Invalid parameter:—"	Invalid parameter number.
004	"Too many parameters:"	Message requires fewer parameters
005	"Too few parameters:-----"	Message requires more parameters
006	"Source does not exist:-----"	The source setup# is wrong
007	"Could not be executed:"	Current content prevented the command from executing.
008	"Checksum error:-----"	The checksum is incorrect.
009	"Unknown request:-----"	Message code undefined. If the message sent as a command it is ignored and no error is returned.
010	"Communication error:-----"	Error receiving serial data on one of the RS-232 ports.
011	"RX Break	A serial break was received.
012	Supplementary info	Additional information about the error. Message content depends on the nature of the error.

Examples:
NOTE: *The 65535 signifies the port address of the controller receiving the message.*

SYNC no longer responding	(65535 00030ERR 001 "System Error: SYNC no longer responding")
Attempt to delete the current source	(65535 00030ERR 002 "System Warning: The current source cannot be deleted")
(BDR38900)	(65535 00030ERR 003 "BDR: Invalid parameter 1")
(BLB 25 25)	(65535 00030ERR 004 "BLB: Too many parameters")
(ASR S10)	(65535 00030ERR 005 "ASR: Too few parameters")
(ASR S10 1)	(65535 00030ERR 006 "ASR: Source does not exist")
(CON 45) with no source	(65535 00030ERR 007 "CON: Could not be executed")
(&con 64 250)	(65535 00030ERR 008 "CON: Checksum Error")
(ABC?)	(65535 00030ERR 009 "ABC: Unknown request")

3.48 FAD
Fade Time

FAD FADE TIME
Use FAD to set the time for dissolving one display image into the next (0=seamless, 100=1 second). Or, if using v1.0 software, FAD sets the time for fading to black and then to the new display image.

3.49 FCS
Focus

FCS FOCUS
The FCS adjusts lens focus on projectors having a motorized lens mount, and requires keypad emulation.

Examples:

(FCS K3)	–ve Focus direction
(FCS K2)	+ve Focus direction.
(FCS K0)	Stop focus adjustment (if not issued, lens movement will continue until it reaches the end stop).

To "nudge" the focus a minimum amount, script in a delay between (FCS K3) and (FCS K0). Depending on your application, a delay of at least 20-30 milliseconds may be sufficient.

3.50 FIL
Input Filter

FIL INPUT FILTER
Use FIL to force an internal filter for HDTV (1), SDTV (2), EDTV (3), Graphics/RGB (4) or to turn the automatic filtering feature off (0). This automatic filter is for analog sources only.

3.51 FLE
Frame Lock Enable

FLE FRAME LOCK ENABLE
Use FLE to define how the projector controls the output frame timing based on the input signal. Use the following parameters to achieve the desired output frame timing.

P1 = 0: Rate Matched – the output runs at close to the input frequency but is not locked to it so the output will drift in phase relative to the output.
P1 = 1: Locked – if possible the output image is phase locked to the input frames
P1 = 2: Free Run – the output runs at 60Hz frame rate

For older versions of software (v1.1 and earlier) this control is a checkbox to enable a "Locked" output. When unchecked the output is "Frame Matched".

3.52 FMT
2/3 Pull Down Threshold

FMT 2/3 PULL DOWN THRESHOLD
Use FMT to adjust the threshold (0-255) at which the projector will consider an incoming video signal as film vs. video.

3.53 FRD
Frame Delay

FRD FRAME DELAY
Use FRD to adjust the number of lines of delay between the input and output frames (range varies with incoming signal).

3.54 FRZ
Freeze Image

FRZ FREEZE IMAGE
FRZ 1 = freeze the image. FRZ 0 = unfreeze the image.

3.55 FSE
Fan Sensor Enable

FSE FAN SENSOR ENABLE
Use FSE if you want the projector to shut down 3 minutes after a critical cooling fan failure. FSE 1 = enabled, FSE 0 = disabled. NOTE: Definition of a which cooling fan is critical varies with projector model.

3.56 FYI
For Your Information

FYI FOR YOUR INFORMATION
The projector broadcasts an FYI message when it detects a change in status. The FYI message contains the relevant status code followed by its new state (P1), up to 2 additional parameters of detail, and a brief text description. The address of the source projector precedes the FYI code.

NOTE: *FYI messages are gated by the Error Message Enable (EME) control. Turning off EME also turns off FYI.*

Status Code	New State (P1)	Meaning and Additional Parameters
001 Power	0 = Off 1 = On 2 = Boot 10 = Cool Down 11 = Warm Up	P1 value indicates the new "Power" state detected.
002 Proj. Address	##### (5-digit address)	P1 value indicates the new address of this source projector.
003 Proj. Selected	0 = RS232 Inactive, UI Inactive 1 = RS232 Inactive, UI Active 2 = RS232 Active, UI Inactive 3 = RS232 Active, UI Active	This projector has been activated or inactivated via the PROJ key or the APJ serial message.
004 Baud Rate	####### (7-digit baud rate)	P1 value indicates the new baud rate.
005 Standby	0 = Off 1 = On	P1 value indicates whether the system is in standby mode
006 Signal	0 = Good Signal 1 = Signal missing 2 = bad sync	P1 describes signal detection P2 = hor. frequency of signal P3 = vert. frequency of signal
007 OSD	0 = Off 1 = On	P1 value indicates whether the on-screen display is on or not.
009 Shutter	0 = Open 1 = Closed	P1 value indicates whether the shutter is open or closed.
010 Input	0 = Open 1 = Closed	P1 describes the current channel number P2 = Switcher# (projector is always switcher "000") P3 = Slot#
011 Picture Mute.	0 = Off 1 = On	P1 value indicates whether the picture is displayed or not
012 PIP.	0 = Off 1 = On	P1 value indicates whether Picture-in-Picture mode is on or not
255 General / Misc.	### (3-digit channel number)	P1 describes miscellaneous general state detected

Examples: (Status code for each FYI is shown as **bold**)
(00030FYI **001** 000 "Powered Off")
(00030FYI **002** 00057 "Projector address changed from 30 to 57")
(00057FYI **003** 001 "Projector UI active, RS-232 Inactive")
(00057FYI **004** 38400 "Baud rate changed to 38400")
(00057FYI **006** 000 01573 05994 "Good Signal")
(00057FYI **006** 002 "Bad Sync: HSync is too high")
(00057FYI **007** 000 "OSD Off")
(00057FYI **009** 001 "Shutter Closed")
(00057FYI **010** 034 000 003 "Switched to channel 34, projector input 03")
(00057FYI **010** 035 000 004 "Switched to channel 35, projector input 04")

3.57 GAM Gamma

GAM GAMMA
Use GAM to set a 3-digit gamma level interpolated between a base curve (2.2 by default, or an arbitrary gamma curve, selected via the BGM Base Gamma control), a high curve (3.0), and a linear curve. Range is 100-280 (=1.8-2.0).

3.58 GIO General Input Output

GIO GENERAL INPUT OUTPUT
Use GIO to configure and control the General Purpose Input and Output (GPIO) bits. There are 7 GIO pins available on the 9pin DIN GPIO connector, plus power and ground.

GPIO Pins	
Connector Pin #	Signal
1	+12V (200mA)
2	GPIO 1
3	GPIO 2
4	GPIO 3
5	Ground
6	GPIO 4
7	GPIO 5
8	GPIO 6
9	GPIO 7

General Message format:
(GIO?)   // Request state and configuration of all pins
(GIO? C#)   // Read configuration for specific pin
(GIO C# <Input/Output>)   // Set pin # configuration to <Input = I, Output = O>
(GIO C# "List of configurations")   // Set multiple pin configurations starting at pin <#> i.e.
<"IOxO"> (GIO # <state>)   // Set pin <#> to <state> H= High, L= Low
GIO # "List of states")   // Set multiple pin states, starting at pin <#> i.e. <"HLxL">
(GIO # P <Duration in ms>)   // Pulse pin <#> for <n> milliseconds

Where   C = configure
                   # = desired pin number or start pin number
                   x = no change

NOTES:
1. When a command is issued to a pin configured as an input, the command triggers the same functions as if the input pin actually changed state.
2. The GIO configuration and state take time to save to the projector. Leave your projector running for several after your setup is complete.
3. GPIO numbers start from 1 not zero.

Examples:

(GIO?)	// Request state and configuration of all pins
(GIO! "HLLLLHL" "IOOOOII")	// Reply of pin state and configuration
(GIO "HLLLLHL" "IOOOOII")	// Set Pin state and configuration. The above commands can be used to save and restore Preference information
(GIO C1 O)	// Set Pin 1 as output
(GIO? C1)	// Get Configuration for pin 1
(GIO!C1 O)	// Reply for get pin configuration
(GIO C2 "OOIO")	// Set pin 2=out, 3=out, 4=in, 5=out
(GIO 1 H)	// If configured as output, set to high
	// If configured as input, perform task equivalent to the input going high
(GIO 1 "HLLL")	// Assuming config as outputs 1=high, 2,3,4=low
(GIO 1 P 100)	// Pulse pin 1 for 100mS

3.59 GNB
Green Blacklevel

GNB GREEN BLACKLEVEL
Set or request the green Blacklevel (0-511) for a specific source setup

3.60 GND
Green Drive

GND GREEN DRIVE
Set or request the green Drive (0-511) for a specific source setup.

3.61 GOG
Green Odd Gain

GOG GREEN ODD GAIN
Set or request the green *Odd Gain* (0-255) for a specific source setup. You can set an Odd Gain value for two separate analog input paths. The first input path is Input 1 (BNC connectors). The second input path is one of: Input 2 (DVI-A connector), or Input 5 or Input 6 (one of the analog option cards).

To leave one of the input values unaffected, enter a value of 0 for the input. If only one value is specified, then both input

Examples:

(GOG 130 135)	Sets the BNC analog path to 130, the DVI/option card path to 135.
(GOG 0 120)	Leaves the BNC path as it was, the DVI/option card path to 120.
(GOG 125)	Sets both paths to 125.

3.62 GOO
Green Odd Offset

GOO GREEN ODD OFFSET
Set or request the green *Odd Offset* (0-255) for a specific source setup. You can set an Odd Offset value for two separate analog input paths. The first input path is Input 1 (BNC connectors). The second input path is one of: Input 2 (DVI-A connector), or Input 5 or Input 6 (one of the analog option cards).

To leave one of the input values unaffected, enter a value of 0 for the input. If only one value is specified, then both input paths will have the same value.

**3.63 HDC
DHDM Configuration**

HDC DHDM CONFIGURATION

When the Dual SD/HD-SDI module is present, the HDC command specifies how the card is being used. The module can be used to support a Dual Link setup or have two independent single HD channels. By default the configuration is set to two single channels. You may select a dual link setup where the 'A' channel on the module is the primary video channel or the selection can be made to have the 'B' channel as the primary video in a dual link format. P1 is the Option Slot number (1 or 2) and P2 is the value you want to set for the configuration (see table below).

Value	Configuration
0	Two Single HD Channels
1	Dual Link, Channel A Primary
2	Dual Link, Channel B Primary

Examples:

(HDC 2 2)	Set configuration on Option slot 2 to be: Dual Link, Channel B primary
(HDC? 2)	Request configuration for slot 2 only; returns (HDC! 002 002) for above setting.
(HDC?)	Request configuration for either slot; returns (HDC! 001 000) (HDC! 002 002) if cards exist in both slots.

**3.64 HDD
DHDM Dual Link Format**

HDD DHDM DUAL LINK FORMAT

When the Dual SD/HD-SDI module is present, it can be configured to accept a Dual Link 292M serial input by combining the separate SDI inputs to allow a higher bandwidth / higher resolution (1920 X 1080) source. The table below shows how to configure the projector to properly display the Dual Link source. This command is only available when the module is present and is only used for Dual Link sources. Parameter 1 is the option slot number you wish to configure (1 or 2), and Parameter 2 the value to select the desired format.

Value	Selected Format
0	4:4:4 RGB 10bit
1	4:4:4 YCrCb 10bit

Examples:

(HDD 2 1)	Configure slot 2 to accept 4:4:4 YCrCb 10bit Dual Link Video
(HDD? 2)	Request current configuration for slot 2 only; from above this would return (HDD 001)
(HDD?)	Request Dual Link format for the main video.
(HDD? p)	Request Dual Link format for the pip video.

3.65 HDL
DHDM Look Thru Setting

HDL DHDM LOOP THRU SETTING

When the Dual SD/HD-SDI module is present, a serial input may be routed to a serial output to allow chaining of signal sources using the HDL command. You can specify which input is routed to which output. Primary and Secondary sources may also be used as designated inputs to loop to outputs. P1 defines the option card slot you wish to configure and P2 refers to what loop thru inputs and outputs are desired. The table below lists the value options.

Value	Input	Output
0	A	C
	B	D
1	A	D
	B	C
2	Primary	C
	Secondary	D
3	Primary	D
	Secondary	C

Examples:

(HDL 2 3)   Set loop thru on option slot 2 to be: Primary thru to D and Secondary thru to C

(HDL? 2)   Request loop thru for slot 2 only; returns (HDL! 002 003) for above setting.

(HDL?)   Request loop thru for either slot; returns (HDL! 001 001)
               (HDL! 002 003) if cards exist in both slots.

3.66 HISS
Lamp History

HIS LAMP HISTORY

Use the read-only HIS request to obtain the projector's lamp history. Note for dual-lamp, this information is stored separately for each lamp (P1 identifies Lamp 1 or 2)—see examples below.

Examples:

(HIS? 1) What is the Lamp 1 history?
        (HIS! 001 001 00555 "000000014") // Lamp 1, sn.="000000014", first lamp used, on for 555 hours
        (HIS! 001 002 00095 "000000018") // Lamp 1, sn.="000000018", second lamp used, on for 95 hours

(HIS?)   What is the complete lamp history for Lamp 1 and Lamp 2?
        (HIS! 001 001 00555 "000000014") // Lamp 1, sn.="000000014", first lamp used, on for 555 hours
        (HIS! 001 002 00095 "000000018") // Lamp 1, sn.="000000018", second lamp used, on for 95 hours
        (HIS! 002 001 00666 "000000022") // Lamp 2, sn.="000000022", first lamp used, on for 666 hours

3.67 HLP
Help

HLP HELP
Use HLP for a list of all serial commands supported in your projector—send the (HLP?) request. Each item in the list has 3 parameters stating if the command is disabled (and why), its 3-character code, and the menu label or brief description:

    P1 = current on/off state of the command

        0 = enabled
        1 = disabled because power is off
        2 = disabled because the required hardware is missing
        3 = disabled because the function has not been licensed
        4 = disabled because the factory option has not been enabled
        5 = disabled because the command is not valid in the current context
        6 = disabled because the user has an insufficient security level
        7 = disabled because the function has been locked in the service menu
        8 = this is a read-only function

    P2 = 3-letter ASCII code for the command (ASR, BRU, etc.)
    P3 = menu label for the command. For those commands for which there is no equivalent menu item, short descriptive text is returned

3.68 HOR
Horizontal Position

HOR HORIZONTAL POSITION
Use HOR to adjust the horizontal position of the image.

3.69 LVS
Lens VariScope System

LVS LENS VARISCOPE SYSTEM
This enables (1) the lens settings to be saved / restored when the channel is changed. When off (0), changing the channel does not affect the lens settings. When LVS is activated it may cause a query to proceed with lens motor calibration (see LCB). Lens calibration is necessary for LVS to function. Since calibration will take a couple of minutes, the user is allowed to decline and leave LVS turned off.

3.70 INM
In Menu

INM IN MENU
Use INM to specify whether a source setup is to be included in (1) or excluded from (0) the source setup selection menu. See section See also 2.5, Accessing Specific Source Setups.

3.71 IOP
Image Optimization

IOP IMAGE OPTIMIZATION
With the IOP control, the user can choose whether raw image quality or the cleanness of image transitions is more important.

Choosing Best Image Quality allows scaler resources to be allocated under some conditions to improve image quality in the form of deeper pixel depth. However, when switching sources, the screen will go blank and increase your switching time.

Choosing Smooth Switching allows for cleaner transitions and/or fading when a user selects a new source to be displayed. The images will fade from the old image to the new image according to the Fade Time control (FAD).

Seamless Switching overrides the Frame Lock Enable (FLE) settings and forces the output to run at 60Hz regardless of the input signal. The image is 100% seamless when switching sources.

Parameter	Value
P1	0 = Best Image Quality 1 = Smooth Switching 2 = Seamless Switching

3.72 ITG
Test Pattern Grey

ITG TEST PATTERN GREY
Use ITG to set the grey level for the flat field internal test pattern. The range of adjustment depends on the bit depth available in your projector model.

3.73 ITP
Internal Test Pattern

Use ITP to display an internal test pattern, or to find out what test pattern is currently displayed. The basic test pattern collection is shown listed below - your projector may vary slightly.

Pattern #	Description
0	User image - no test pattern displayed.
1	Grid + grey scale + color bars + circle + convergence marks
2	Gray Scale 16
3	White
4	Grey - slide bar selects value 0-1023
5	Black
6	Checker
7	13 point
8	Color Bars
9	RGBW Grey Scale
10	Multi Color
11	Edge Blend
12	Aspect Ratio
13	Red & Blue ramp

3.74 KEN
Keypad Enable

KEN KEYPAD ENABLE
Use KEN to set the keypad input protocols, Wired, IR Front and IR Rear, to respond to the protocol of the desired keypad. The following table outlines how to use the command parameters to set the desired protocols. Note: the built-in keypad cannot be disabled.

NOTE: *Protocols B – G are used with the 'Brick' style rental staging keypad.*

Parameter	Value
P1	0 = Wired 1 = IR Front 2 = IR Rear
P2	0 = Off 1 = Responds to any protocol 10 = Protocol A 11 = Protocol B 12 = Protocol C 13 = Protocol D 14 = Protocol E 15 = Protocol F 16 = Protocol G

Example:
(KEN I2 12): Sets IR Rear to Protocol C
(KEN? I1) returns (ken! I001 001): the current protocol for IR-front

3.75 KEY
Key Code

KEY KEY CODE

To emulate use of the projector's keypad, you can send codes representing each keypress. **NOTE:** *For most keys, sending a key code to depress a key also sends a code to release the key. Key codes for arrow keys and lens keys, however, cause continual adjustment that must be stopped with a separate code.*
3.76 KST Keystone

KST KEYSTONE
Use KST to correct vertical keystone (14-50) so that the sides of the image do not slope away from each other, and the image is rectangular. The default value is 32 (no keystone).

For advanced 2D keystone using the Warp Module, see Warp Keystone Corners (WKC).

3.77 LBL Left Blanking

LBL LEFT BLANKING
Use LBL to blank the left edge of the image (0-1000). The amount of blanking feasible depends on the incoming source data.

3.78 LCB Lens Calibrate

LCB LENS CALIBRATE
LCB forces the projector to calibrate the lens/motors and is intended for use in conjunction with Wolf Cinema's Lens VariScope System (LVS). Lens Calibration is not necessary if LVS is not used.

LCB provides three types of calibrations to be performed. A Reference calibration locates a positional reference point for repeatable motor positioning. A Motion calibration calculates and sets motion parameters that optimize individual motors response for accurate positional placement. A Full calibration executes both of these calibrations.

If LVS has already been enabled (refer to LVS command), a Reference calibration will be performed when the projector is powered up. Motion calibration only needs to be done once when LVS is initially enabled because the results are retained in memory for future use. Therefore, if LVS is to be used, it is only necessary to perform motion calibration once.

LVS can only be enabled if both calibrations have been performed at least once. If LVS is disabled, neither calibration is necessary.

Refer to the tables below for the parameters to control the LVS calibration process.

Command Values:

Parameter	Description
1 - Relative	Calibrate Motor Zero Reference Position
2 - Manual	Calibrate Motion Parameters for Lens Motors
3 - Calibrate	Calibrate both Reference and Motion Parameters

Query Values:
1 = calibration has been done, 0 = calibration has not been done

Parameter	Description
Reference Calibration	Motion Calibration

Examples:
- (LCB 3) Stop Horizontal Movement, Lens will not stop until this command is issued or the end stop is reached.
- (LCB?) Query the current status of calibration, responds with (LCB!1 0) indicates that reference is calibrated but motion parameters are not.

3.79 LDT
Level Detector

LDT LEVEL DETECTOR
Enable (1) or disable (0) the LDT (Level Detector Test) mode that can aid in setting up input levels. Use in conjunction with LDV (Level Detector Value), which defines a threshold below which all incoming colors will be turned black, and above which all colors will turn to white. At this point, the Level Detector will be enabled.

3.80 LDV
Level Detector Value

LDV LEVEL DETECTOR VALUE
Use an LDV setting of 1 to 1023 when the LDT (see above) will be enabled. This is a threshold below which all incoming colors will be turned black, and above which all colors will turn to white, and is an aid for setting up input levels.

3.81 LHO
Lens Horizontal Offset

LHO LENS HORIZONTAL OFFSET
LHO adjusts horizontal offset on projectors having a motorized lens mount, and requires keypad emulation.

Examples:

(LHO K3)	Move the image to the right →
(LHO K2)	Move the image to the left ←
(LHO K0)	Stop horizontal movement (without this, lens movement will continue until it reaches the end stop).

To "nudge" the image a minimum distance, script in a delay between (LHO K3) and (LHO K0). Depending on your application, a delay of at least 20-30 milliseconds may be sufficient.

3.82 LTC
Lamp Tracking
Calibration

LTC LAMP TRACKING CALIBRATION
Use LTC to calibrate the current lamp and optical response.

Parameter	Description
P1 = Calibration	0 = Use default settings 1 = Run automatic calibration on current projector or, if more parameters present, 1= Set custom gain and offset
P2 = Gain	Gain value can be from 0 to 32767
P3 = Offset	Offset value can be between -32768 to 32767

NOTE: *LTC calibration can take several minutes to complete and will vary the lamp output during calibration. All lamp settings will return to their initial condition once the calibration has been completed.*

Warning: Custom settings allow the user to set LTC to any value within the specified range. The software does not check that the specified values are functional.

3.83 LME
Lamp Message Enable

LME LAMP MESSAGE ENABLE
Use LME to enable (1) or disable (0) display of the lamp timer message when the lamp has reached its *Lamp Limit* setting.

3.84 LNG
Language

LNG LANGUAGE
Use LNG to get/set the current language used in the projector's menu system.

1 = English	4 = German
2 = French	5 = Italian
3 = Spanish	

3.85 LPC
Lamp Changed

LPC LAMP CHANGED
Use LPC to record a new lamp serial number (8 characters max.) in projector memory. This will automatically reset the projector's lamp timer so that it begins to log time for the new lamp.

3.86 LPH
Lamp Hours of Use

LPH LAMP HOURS OF USE
Use the request LPH to find out the number of hours logged on the current lamp.

3.87 LPI
Lamp Intensity

LPI LAMP INTENSITY
Use LPI to specify a desired light intensity setting (0-9999 for any model) for the lamp, and automatically put the lamp into the "Intensity" mode also known as Lamp Tracking.

3.88 LPL
Lamp Limit

LPL LAMP LIMIT
Use LPL to specify the number of hours the lamp can operate within the projector before a warning message appears telling the user that the lamp limit has expired and the lamp needs replacement (System Warning also given: LEDs flash). The range varies with projector—do not set beyond the expected life for the type of lamp installed.

3.89 LPM
Lamp Mode

LPM LAMP MODE
Use LPM to control how you run the lamp (0=max brightness, 1=maintain intensity setting for models with Lamp Tracking, 2=maintain power setting). If you choose constant intensity or constant brightness, you must also specify the desired level using the corresponding LPI (intensity) or LPP (power) command. See LPI and LPP.

3.90 LPP
Lamp Power

LPP LAMP POWER
Use LPP to set the desired lamp power level (in watts—range depends on the projector model), and automatically put the lamp into the "Power" mode.

3.91 LPS
Lamp Status

LPS LAMP STATUS
Use the read-only request LPS to find out the status of the current lamp(s):
      0 = Good lamp
      1 = Lamp fan has failed (NOTE: in dual lamp models, Fan 8 cools Lamp 1, and Fan
          10 cools Lamp 2)
      2 = Lamp can't ignite
      3 = Lamp turned off unexpectedly
      4 = Lamp interlock problem
      5 = Color wheel failure (NOTE: dual lamp models only)
      6 = Lamp compartment too hot (NOTE: dual lamp models only)
      7 = Driver Vcc too low (NOTE: dual lamp models only)
      8 = Lamp not installed (NOTE: dual lamp models only)
      9 = Operation error (NOTE: dual lamp models only)

3.92 LVO
Lens Vertical Offset

LVO LENS VERTICAL OFFSET
The LVO adjusts vertical offset on projectors having a motorized lens mount, and requires keypad emulation.

Examples:
(LVO K3)	Move the image down
(LVO K2)	Move the image up
(LVO K0)	Stop vertical movement (without this, lens movement will continue until it reaches the end stop).

To "nudge" the image down a minimum distance, script in a delay between (LVO K3) and (LVO K0). Depending on your application, a delay of at least 20-30 milliseconds may be sufficient.

| 3.93 MFT Menu Font | **MFT MENU FONT**
Use MFT to choose whether menu font size is normal (0) or large (1). |

MFT MENU FONT

Use MFT to choose whether menu font size is normal (0) or large (1).

3.94 MLK Source Memory Lock

MLK SOURCE MEMORY LOCK

Use MLK to lock (1) or unlock (0) a specific source setup. See also 2.5, Accessing Specific Source Setups.

3.95 MNU Menu Status

MNU MENU STATUS

The MNU command has two uses. One is to get the current status of the menus and customize the menu structure and the other is to define and activate a custom menu.

When using serial commands to operate the menu, likely don't want the menu to appear on the screen. To prevent the menu from appearing on the screen while using serial commands, use the OSD command. In addition, you may want to disable the keypads using the KEN command.

Some menus automatically change particular settings to make adjustments easier. Depending on the context, you may also need to send:

ACE x   to enable or disable Automatic Color Enables
MNU 3 x   to enable or disable Automatic Test Pattern selection

Parameter	Value	Description
P1	0-3	0=presentation level 1=main menu 2=sub menu 3=enable or disable automatic test patterns
P2	When P1=2, #=0-9 When P1=3, #=0-1, to enable or disable automatic test patterns	#= the number of the submenu you wish to go to #=0, restore normal operation #=1, disable automatic test pattern

MNU can also be used to create a custom menu. For example, (MNU "My Menu" "BRT" "CON" "PIP"), produces a custom menu called "My menu" consisting of the Brightness, Contrast, and Picture in Picture Enable controls.

You can combine this with a RTE FUNC key event to make the custom menu available from a keypad. For example, (RTE F 3 "(MNU "My Menu" "BRT" "CON" "PIP")"), will pop up the custom menu when the FUNC-3 key is pressed.

NOTE: *this custom menu is not saved anywhere – as soon as you exit from it, the menu no longer exists and when you want to display it again you must send the **MNU** command, with all the controls, again. It is expected that this command will be used in conjunction with a **RTE FUNC** key event to have the custom menu available from a keypad.*

3.96 MOT
Motion Filter

MOT MOTION FILTER
Use MOT to control how de-interlacing is managed.

      0 = Auto — software determines the best option.
      1 = Still — produces crisp images when there is no motion.
      2 = Motion — for video not originally from film, or for moving computer-generated images
      3 = Film — performs inverse telecine operation to reproduce accurately and crisply material originating from 24Hz film.

3.97 MSH
Menu Shift Horizontal

MSH MENU SHIFT HORIZONTAL
Use MSH to move menus horizontally (0 = Left, up to 466 right)

3.98 MSP
Menu Location

MSP MENU LOCATION
Use MSP to moves menus to a preset location:

      0 = 4:3 Top/Left
      1 = 4:3 Inset 1
      2 = 4:3 Inset 2
      3 = 16:9 Top/Left
      4 = 16:9 Inset 1
      5 = 16:9 Inset 2
      6 = Custom (read-only)

3.99 MSV
Menu Shift Vertical

MSV MENU SHIFT VERTICAL
Use MSV to move menus vertically (0 = Top, up to 350 Down)

3.100 NAM
Source / Channel Name

NAM SOURCE / CHANNEL NAME
Set / get a source setup name. See also 2.5, Accessing Specific Source Setups.

3.101 NRD
Noise Reduction

NRD NOISE REDUCTION
Use NRD to set the noise reduction level.

3.102 NSI
Number Select Image

NSI NUMBER SELECT IMAGE
Use NSI to use the numeric keys 1-8 as input keys for the main image. This option is only effective when the Menu system is not active, for example when Picture-in-Picture is enabled.

      0 = Never
      1 = Only when the PIP window is active
      2 = Always

3.103 NTR
Network Routing

NTR NETWORK ROUTING
Use NTR to specify which ports are joined in a common network. By default, only RS232 ports (IN & OUT) are linked. If desired, add the RS422 port(s) to this network, and/or the Ethernet port.

      0 = RS232, RS422 & Ethernet communications are all separate from one another
      1 = RS422 port(s) is/are connected to the RS232 network
      2 = The Ethernet port is connected to the RS232 network
      3 = RS232, RS422 & Ethernet are all connected to each other

3.104 OSD
On Screen Display

OSD ON SCREEN DISPLAY
Enable (1) or disable (0) the on-screen display of the menus system.

**3.105 OTF
Output Format**

OTF OUTPUT FORMAT
Change output format for Cine-IPM 2K.
> 0 = Single Link on DVI-1 or DVI-2
> 1 = Twin Link

NOTE: *DVI-1 has lower 8 bits; DVI-2 has higher 2 bits).*

**3.106 PAP
PIP Aspect Ratio Preset**

PAP PIP ASPECT RATIO PRESET
Use PAP to select the preferred aspect ratio for your Picture-in-Picture window.
> 0 = Default
> 1 = Anamorphic
> 2 = Custom (Response only – The vertical stretch does not correspond to one of the
> settings.)

**3.107 PBC
PIP Border Color**

PBC PIP BORDER COLOR
Use PBC to select the color for the Picture-in-Picture window border.
> 0=Black
> 1=DarkRed
> 2=DarkGreen
> 3=DarkBlue
> 4=DarkCyan
> 5=DarkMagenta
> 6=DarkYellow
> 7=DarkGrey
> 8=LightGrey
> 9=Red
> 10=Green
> 11=Blue
> 12=Cyan
> 13=Magenta
> 14=Yellow
> 15=White
> See also PBW.

**3.108 PBW
PIP Border Width**

PBW PIP BORDER WIDTH
Use PBW to specify the width (0-10) of the border of the Picture-in-Picture window. See also
PBC.

**3.109 PDT
Peak Detector**

PDT PEAK DETECTOR
Enable (1) or disable (0) the peak detector test mode as an aid in setting up input levels.

**3.110 PHP
PIP Horizontal Position**

PHP PIP HORIZONTAL POSITION
NOTE: *Not available in v1.0.*

Use PHP to set the horizontal position (0-100) of the picture-in-picture window. Range is a
percentage of the screen size.

**3.111 PHS
PIP Horizontal Size**

PHS PIP HORIZONTAL SIZE
NOTE: *Not available in v1.0.*

Use PHS to set what percentage (0-100) of the screen width to use for the width of the Picture-in-Picture window. Height of the window will then be determined by the aspect ratio of the input image.

**3.112 PIP
Picture-in-Picture**

PIP PICTURE-IN-PICTURE
Use PIP to turn picture-in-picture on (1) or off (0). **NOTE:** *Not available in software v1.0.*

**3.113 PJH
Projector Hours of Use**

PJH PROJECTOR HOURS OF USE
Use PJH to determine the number of hours (0-16,777,215) the projector has been operated, including cool-down modes.

**3.114 PLK
Parameter Lockout**

PLK PARAMETER LOCKOUT
Use PLK to specify which menu options are to be locked from the user (note: a lockout can still be accessed via ASCII command). In a PLK message, P1 represents the corresponding function code (e.g., CNT, CTM, etc.) you wish to lock or unlock. Where several related options—such as blanking controls—share a single lockout, locking or unlocking any one of the options toggles the full lockout status.

To lock/unlock all options, omit any P1 function code from your PLK set message.
<u>**Examples:**</u>
(PLK "CON" 1)   Lock the "Contrast" control
(PLK 1)   Lock all possible options
(PLK "BRT" 0)   Unlock the "Brightness" control

**3.115 PND
Plug & Display Modes**

PND PLUG & DISPLAY MODES
Use PND to specify the display mode requested of the video source.
NOTE: *The source computer may need to be rebooted before this setting will take effect.*
0 = Default Timing (Native Resolution @ 60Hz)
1 = 1024 x 768 x 116Hz
2 = 720p (1280 x 720 x 60Hz)
3 = 1080p50/1080i50
4 = 1280 x 1024 x 110Hz
5 = 1400 x 1050 x 60Hz
6 = 1400 x 1050 x 102Hz
7 = DC2k (2048 x 1080 x 60Hz)
8 = 1080p60/1080i60
9 = 1080p24/1080p30Hz

3.116 PNG
Ping

PNG PING

Use PNG to request and get basic projector information such as the type of projector & main software version installed on the TIPM (10-bit Image Processor Module).

      P1 = Wolf Cinema projector type

            ❑ 31 = a projector listed on page 3 (always). These all include a TIPM.

            ❑ 0 = the projector is not initialized

      P2 = Major s/w version# (0-99)

      P3 = Minor s/w version# (0-99)

      P4 = Maintenance version# with no functional change (a-z)

      P5 = Beta version#, if applicable only (1-199)

      P6 = Variation, such as an OEM. Preceded with "T" (T1-T63)

Examples:

(png?) (png! 031 001 000)   // TIPM version 1.0

(png?) (png! 031 002 005 b)   // TIPM version 2.5b

(png?) (png! 031 003 001 T005)   // TIPM version 3.1 T5 (=variation of released version v3.1)

(png?) (png! 031 001 000 c 045 T002) // TIPM version 1.0c.045 T2 (=variation of beta version 1.0c.045)

3.117 PPP
PIP Position Preset

PPP PIP POSITION PRESET

Use PPP to select the preferred position and size for the Picture-in-Picture window.

      0 = Top right

      1 = Top left

      2 = Bottom left

      3 = Bottom right

      4 = Custom (Response only – The size and position do not correspond to any of the defaults.)

3.118 PPS
PIP Swap

PPS PIP SWAP

Use PPS to swap the picture-in-picture window with the main window. PPS is a toggle command with no parameters.

3.119 PSW
Alternative Service Password

PSW ALTERNATIVE SERVICE PASSWORD

Use PSW to find out the most recently defined password for accessing the service menu, or to define an alternative service password (range = 0-32768). Note that defining an alternative PSW simply *adds* a password to projector memory so that you may use either the original factory-defined Wolf Cinema password (which is always valid) *or* this new password. Because (PSW?) will find only the most recently defined password, the factory-defined password cannot be retrieved in this manner once you have created an alternative password. Use PWE to enable/disable passwords as described below.

3.120 PVP
PIP Vertical Position

PVP PIP VERTICAL POSITION

Use PVP to set the vertical position (0-100) of the picture-in-picture window. Values represent what percentage of the screen size is used for the picture-in-picture window.

3.121 PWE
Password Enable

PWE PASSWORD ENABLE

Enable (1) or disable (0) the service password for access to the service menu.

3.122 PWR
Power

PWR POWER
Use PWR to turn the projector power on or off, or to use special modes during a download, or to see the current power state.

   0 = Off
   1 = On
   2 = Boot mode (for downloading new code only) **DO NOT USE** ⚠️
   3 = No lamp (powered up, but lamp is off. For downloading only.)
   11 = Warming up (read only)

3.123 PXP
Pixel Phase

PXP PIXEL PHASE
Use PXP to adjust the position of the sampling clock relative to the video data. Available range depends on the incoming signal, with a higher frequency source having ½ the range of a lower frequency source.

3.124 PXT
Pixel Tracking

PXT PIXEL TRACKING
Use PXT to adjust the number of pixels/lines in the image. Range depends on the horizontal sync frequency.

3.125 RBL
Right Blanking

RBL RIGHT BLANKING
Use RBL to blank the right edge of the image (0-1000). The amount of blanking feasible depends on the incoming source data.

3.126 RDB
Red Blacklevel

RDB RED BLACKLEVEL
Set or request the red Blacklevel (0-511) for a specific source setup.

3.127 RDD
Red Drive

RDD RED DRIVE
Set or request the red Drive (0-511) for a specific source setup.

3.128 REM
Remote Commands

REM REMOTE COMMANDS
Allows arbitrary serial data to be sent out a specified port and the data can also be read from that port. It is intended to be used in conjunction with the RTE commands to allow a single event to control other equipment connected to the projector.

Before being used, a port must be configured. After configuration, the port cannot be used for standard Wolf Cinema protocol commands until that port is reconfigured as a Wolf Cinema port again. See tables below for setting port configuration, reading port configuration and sending and receiving arbitrary data from a port.

Configuring a Port

P1 = Port	P2 = Port Configuration	P3 = Baud Rate
1 = RS232 IN 2 = RS232 OUT	R = Remote equipment C = Wolf Cinema standard protocol	Same as for the BDR command (i.e. 96, 1152 or 115200…)
3 = RS422 (db9) 4 = RS422 (XLR – only some models) 5 = RS422 (XLR – only some models)		

  Examples:
  (REM 2 r 96): Configures the OUT port to send arbitrary data at 9600 baud
  (REM 2 c): Returns the OUT port to normal operation

Reading the Configuration of a Port

P1 = <c>'port'   Same values for 'port' as above
>   **Example:**
>   (REM? C2): Returns (REM! C002 r 0115200)

Sending Arbitrary Data Out a Port
P1 = Port   Same values for 'port' as above
P2 = Data   The data to send out the specified port
>   **Examples:**
>   (REM 2 "A123"): The data A123 is sent out the OUT port without any other protocol
>   characters. Some codes are not standard ASCII characters. These can be sent by
>   using any of the escape codes defined in the section on text parameters.
>   (REM 2 "123\h1645): Sends the following bytes: 0x31,0x32,0x33,0x16,0x34,0x35

Reading Arbitrary Data from a Port
P1 = Port   Same values for 'port' as above
>   **Example:**
>   (REM? 2): Returns (REM! 002 "1234"). "1234" is the data returned from the remote
>   equipment.

3.129 ROG Red Odd Gain

ROG RED ODD GAIN
Set or request the red *Odd Gain* (0-255) for a specific source setup. You can set an Odd Gain
value for two separate analog input paths. The first input path is Input 1 (BNC connectors). The
second input path is one of: Input 2 (DVI-A connector), or Input 5 or Input 6 (one of the analog
option cards).

To leave one of the input values unaffected, enter a value of 0 for the input. If only one value is
specified, then both input paths will have the same value.

>   **Examples:**
>   (ROG 130 135)   Sets the BNC analog path to 130, the DVI/option card path to 135.
>   (ROG 0 120)   Leaves the BNC path as it was, the DVI/option card path to 120.
>   (ROG 125)   Sets both paths to 125.

3.130 ROO Red Off Offset

ROO RED ODD OFFSET
Set or request the blue *Odd offset* (0-255) for a specific source setup. You can set an Odd Offset
value for two separate analog input paths. The first input path is Input 1 (BNC connectors). The
second input path is one of: Input 2 (DVI-A connector), or Input 5 or Input 6 (one of the analog
option cards).

To leave one of the input values unaffected, enter a value of 0 for the input. If only one value is
specified, then both input paths will have the same value.

3.131 RTE
Real Time Events

RTE REAL TIME EVENTS

Use RTE to specify actions to be initiated at a certain point in time or by an external stimulus. This action can be anything supported in the projector, as long as the action itself is not embedded within an RTE command (such as GIO input simulation and others). There are four types of RTEs:

   T = Timed event
   D = Scheduled/delayed single event
   G = GPIO port change
   S = System Status Change
   F = FUNC key event
   X = Delete event

If P1 = T or t	Description	Meaning
P1 = T or t	Timed event	This is a "timed" (scheduled) event
P2 – P7 = Date/Time	yyyy/MM/dd hh:mm:ss	Date and time for first occurrence
P8 = Schedule	S = Single one-time event	Frequency of the event
	D = Daily	
	W = Weekly	
P9 = ASCII message	Any valid ASCII command	Activity in the event

If P1 = D or d	Description	Meaning
P1 = D or d	Delayed event	This one-time event is scheduled to occur at a certain point in the future.
P2 – **P4** = Amount of delay	hh:mm:ss	How long to wait before starting the event
P5 = ASCII message	Any valid serial protocol	Represents action taken during the event

If P1 = G or g	Description
P1 = G or g	GPIO port change. This is a real-time I/O event.
P2 = I/O bit	1-255, depending on hardware (in the case of masking, this represents the starting pin number).
P3 = Level	H or h = high (transition to active state) L or l = low "LHxxxHLx" combines multiple inputs and trigger occurs when all conditions are met.
P4 = Which ASCII command	Any valid serial command

If P1 = S or s	Description	Meaning
P1 = S or s	System event	This one-time event is scheduled for a certain point in time in the future.
P2 = Type of system event	0 = Boot	Defines events internal to the hardware that can trigger command sequences.
	1 = Power*	
	2 = Error *	
	3 = Signal Valid	
	4 = Signal Bad / No Signal	
	5 = Signal Input Change*	
	6 = Signal Channel Change*	
	* May also include P3 info (below)	

P3 = State/details (opt.)	P3 only applies if:
	P2 = 1 (Power)
	  If P3 is 0 = Power Off
	  If P3 is 1 = Power On
	P2 = 2 (Error)
	  P3 = error number
	P2 = 5 (Signal Input)
	  P3 = Input number
	P2 = 6 (Signal Channel)
	  P3 = Channel Number
		This optional parameter further defines the state. If this is omitted, assume the event will fire on any system event of this type (for example, all signal input changes rather than a specific one)

If P1 = F or f	Description	Meaning
P1 = F or f	FUNC key event	This is a real-time event that triggers a command when the specified FUNC # is pressed.
P2 = Number key	1-5, 7-9	The number to trigger from.

If P1 = X or x	Description	Meaning
P1 = X or x	System event	This deletes a stored event.
P2 = Target	* = Delete all events d = Delete all pending events waiting because of a DLY command. Number = Delete the event with the given number from the list	This parameter determines which events will be deleted.

Examples:
(RTE g 7 H "(GIO 22 P 100)")
(RTE g 7 H "(GIO 22 P 100) (GIO 1 L)")
(RTE G 7 H "(GIO 22 P 100) (GIO 1 L)")
(RTE T 2003/07/09 12:36:45 S "(PWR 1)")   = "S" Single / one time
(RTE T 2003/07/09 18:00:00 D "(PWR 0)")   = "D" Daily
(RTE T 2003/07/09 05:00:00 W "(PWR 0)")   = "W" Weekly
(RTE F 3 "(FRZ 1)")   // freeze image when FUNC-3 pressed
(RTE D 00:05:00 "(PWR 0)")   = In 5 minutes, turn the projector off
(RTE G 5 H "(DLY 100) (PWR 0)")   = When pin 5 goes high, delay 100ms, then
                                                     power off.

(RTE!000 T 2003/07/09 05:00:00 S "(PWR 0)")

(RTE X 1): delete entry one
(RTE X *): delete all entries
(RTE X d): delete all pending events waiting because of a (DLY) command

3.132 SAV
Save Change

SAV SAVE CHANGES
The projector normally saves any changes every few minutes and with every power-down. Use SAV to save changes immediately, and to retain them in the event of a power failure. The projector will save into flash memory all outstanding changes. The SAV message has no parameters.

3.133 SBE
Slidebar Enable

SBE SLIDEBAR ENABLE
Use SBE to show (1) or hide (0) slidebars during use.

3.134 SDE
Source Dialog Enable

SDE SOURCE DIALOG ENABLE
Use SDE to show (1) or hide (0) the on-screen dialog box when selecting an input using numbered keypad entry.

3.135 SHU
Shutter

SHU SHUTTER
Use SHU to open (0) or close (1) any installed shutter mechanism.

3.136 SIN
Select Input

SIN SELECT INPUT
Use SIN to switch to a specific input.
> 1 = BNC
> 2 = DVI-I
> 3 = Composite
> 4 = S-Video
> 5 = Option slot #1
> 6 = Option slot #2
> 7 = Option slot #1 – its secondary input if present
> 8 = Option slot #2 – its secondary input if present

3.137 SIZ
Size

SIZ SIZE
Use SIZ to control image width and height in tandem, maintaining the incoming aspect ratio (1000 = no resizing).

3.138 SOR
Screen Orientation

SOR SCREEN ORIENTATION
Use SOR to specify the orientation of the projector in relation to the screen.
> 0 = Front
> 1 = Rear
> 2 = Ceiling Front
> 3 = Ceiling Rear

3.139 SPS
Splash Select

SPS SPLASH SELECT
Use SPS to select when to display the splash screen.
> 0 = Off
> 1 = Startup only
> 2 = Startup and no signal (default)
> 3 = Always on

3.140 SRC
Select Source

SRC SELECT SOURCE
Use SRC to switch to a specific source setup ## (1-50). This is the same as CHA command.

3.141 System Status

SST SYSTEM STATUS
Use SST to find out a variety of information about the current state of the projector. The single broad-ranging request **(SST?)** for *all* information triggers the return of a series of replies as if multiple requests had been sent. In each of these status replies, P1 explains the general content or topic in the reply, and P2 the individual details. To obtain status regarding one topic only, specify the desired P1 parameter corresponding to that topic in your request—for example, the request **(SST?0)** will trigger general projector information only. For a specific single-status inquiry, include both P1 and P2 in the request—for example, **(SST?4 2)** asks whether the lamp door is open or closed. Thus you can use the SST *request* command in 3 ways:

1)   **(SST?)** returns all results along with descriptive text/data. The specifics within each of the five status groups will vary from model to model and be affected by options installed, software versions and other factors, thus a general SST inquiry is a good way to establish exactly what status reports are available for your projector.
2)   **(SST? X)** where X = which _Status Group_ 0-4 (P1). This request obtains all results belonging to this status group.
3)   **(SST? X Y)** where X = which _Status Group_ 0-4 (P1), and Y= which _Detail_ 0-varies (P2). This request obtains

For all projectors listed on page 3:
   P1 = _Status Group_
              0 = General Projector Model Information – model, serial#, resolution, factory settings, etc.
              1 = System Status – power on/off, lamp, hours of use, shutter, OSD, etc.
              2 = Signal Information – source frequency, channel#, switching, etc.
              3 = Operation Status – errors, temperatures, and interlocks
              4 = Versions – h/w versions, s/w versions, h/w serial numbers, optional modules

3.142 STD Video Standard

STD VIDEO STANDARD
Use STD to select the video standard to use with the video input. If "auto" is selected (8) the projector will automatically find the correct standard. If a request for standard is made and the standard has been set to "auto" the return value will be preceded with an 'A'.
          0 = PAL
          1 = NTSC
          2 = SECAM
          3 = NTSC4.43
          4 = PAL-M
          5 = PAL-NC
          6 = PAL-60
          7 = NTSC
          8 = Auto-select

NOTE: *The numbers associated with a standard in this list has no relation to the standard's menu position on screen.*

3.143 SZP
Size-Position Presets

SZP SIZE-POSITION PRESETS
Use SZP to resize the image according to one of several preset methods. Any value other than "1" shows Custom in the menu. Note: When set to default (0), a reading from the projector will identify the current default setting.

        0 = Default
        1 = No Resizing
        2 = Full Screen
        3 = Full Width
        4 = Full Height
        5 = Anamorphic
        6 = Custom resizing (read only)

3.144 TBL
Top Blanking

TBL TOP BLANKING
Use TBL to blank (turn to black) the top of the image. Range depends on the source.

3.145 TMD
Time & Date

TMD TIME & DATE
TMD sets the time & date in the projector's Real Time Clock.

        P1 = Year (####, such as 2005)
        P2 = Month (1= Jan., 2 = Feb., etc.)
        P3 = Date (1-31)
        P4 = Hour (0-23, 24-hr. clock)
        P5 = Minute (0-59) P6 = Second (0-59)

Examples:
(TMD!2004/08/13 14:21:00) = August 13, 2004 at 2:21 pm
(TMD!2005/02/03 08:12:00) = February 3, 2005 at 8:12 am

3.146 TNT
Tint

TNT TINT
TNT sets the tint for video images. The TNT value represents a percentage, e.g. 1000=100.0 % or 0505=50.5%.

3.147 USR
User Message

USR USER MESSAGE
Use USR to load a user message for display in the Status menu. Use the form (USR<text>) following the structure outlined in the following table to set the desired text to be displayed.

Parameter	Name	Description
P1	Text	The text may contain the following special characters (all characters 0-255 that are not in this list may be included in the text directly): \n = new line \\ = backslash \" = quote \(= left bracket \) = right bracket \b = 0x01 control code (beginning of message) \e = 0x0E control code (end of message) \s = 0x13 control code (Xoff) \g = 0x11 control code (Xon) \c = 0x1B control code (ESC) The last entries in the table are control codes that will not appear in a status page message -- they are listed here for completeness because the same text format is used to save and restore source data as well as to download code.

When a request is made to retrieve the user message that has already been set, the returned value is displayed in the same format as setting the text.

Examples:
(usr"hello world")   - basic user message.
(usr"hello world\nline two")   - message with new line in the middle.
(usr"Contact \"freddy\" for help")   - message with embedded quote.
See 2.1, Basic Message Structure for text parameters.

3.148 VBL
Video Black Level

VBL VIDEO BLACK LEVEL
Use VBL to set black levels to 0 IRE (0) or 1 (7.5 IRE) for video signals. Most NTSC standards include a 7.5IRE "Setup" to the video black level. By adjusting this setting the projector can be optimized for incoming data with or without this "Setup". If it is set wrong the image will have elevated blacks or crushed blacks.

3.149 VRT
Vertical Position

VRT VERTICAL POSITION
Use VRT to adjust the vertical position of the image.

3.150 VST
Vertical Stretch

VST VERTICAL STRETCH
Use VST to electronically stretch the image vertically (200-4000) without affecting the horizontal size. 1000 is the neutral position (no stretching).

3.151 WFH
Warp Prefilter H

WFH WARP PREFILTER H
Use WFH to set or request the warp horizontal pre-filter. Requires Wolf WARP module.

3.152 WFV
Warp Prefilter V

WFV WARP PREFILTER V
Use WFV to set or request the warp vertical pre-filter. Requires Wolf WARP module.

3.153 WKC
2D Keystone Corners

WKC 2D KEYSTONE CORNERS
NOTE: *Requires Wolf WARP module.*

Use WKC to set or request the x/y coordinates for the four corners defining "2D keystone", i.e. a 4-sided image shape.
P1 = index of the position to *set* or *request*
P2 = value to set if it is a *set* command

The valid indices are as follows, each with a range that depends on the resolution of the projector you are working with:
1 = Top Left Corner – Horizontal Position (x)
2 = Top Left Corner – Vertical Position (y)
3 = Top Right Corner – Horizontal Position (x)
4 = Top Right Corner – Vertical Position (y)
5 = Bottom Left Corner – Horizontal Position (x)
6 = Bottom Left Corner – Vertical Position (y)
7 = Bottom Right Corner – Horizontal Position (x)
8 = Bottom Right Corner – Vertical Position (y)

Any coordinate value that is ½ that of the native resolution of the projector defines a "normal" location (i.e., no warping). For example, in a projector with 1400 x 1050 resolution, any "x" value of 700 is normal. A value over 700 moves a corner to the right; a value below 700 moves a corner to the left. A value of 0 moves a corner as far from center as possible (which may be off the screen). You can move a point towards center by a distance that is ¼ of the full resolution—for example, you can move the top left point to the right by a maximum distance of 350 pixels, which is ¼ of the total 1400 pixels available.

**3.154 WPL
Warp Latency**

WPL WARP LATENCY
Use WPL to set or request the warp latency. Requires Wolf WARP module.

**3.155 WPS
Warp Select**

WPS WARP SELECT
Use WPS to select which warp map to use, or to disable warping. Requires Wolf WARP module.

> 0 = Disable
> 1 = 2D Keystone
> 2-4 = User-defined maps

**3.156 WSH
Warp Sharpness**

WSH WARP SHARPNESS
Set or request the warp sharpness.

**3.157 ZOM
Zoom**

ZOM ZOOM
The ZOM adjusts lens zoom (image size) on projectors having a motorized lens mount, and requires keypad emulation.

> <u>**Examples:**</u>
> (ZOM K3)   Zoom in for a smaller image
> (ZOM K2)   Zoom out for a larger image
> (ZOM K0)   Stop zoom adjustment (if not issued, lens movement will continue
>   until it reaches the end stop).

To "nudge" the zoom in a minimum amount, script in a delay between (ZOM K3) and (ZOM K0). Depending on your application, a delay of at least 20-30 milliseconds may be sufficient.

THROW DISTANCE

CALCULATING THROW DISTANCE

It is important throw distance be precisely calculated for your installation using the appropriate formula from the chart below. To calculate throw distance you must know the screen size and the lens type installed in the projector. In general, the larger you want the image to be the greater the distance you must allow between the lens and the screen.

NOTES: 1) *Throw distance is measured from the screen to the front of the projector's front feet (on Integrated (i) units) or internal light engine face (on Full Dress (FD) units).* **2)** *This measurement is not necessarily parallel to the floor as the projector and screen may be inclined.* **3)** ***Due to lens manufacturing, throw distance calculations have a tolerance of ± 5%.***

Throw Distance Calculation for DCX-i

Throw Distance measured from screen to front of Projector
1.45 - 1.8 HD Min. 1.45 x screen width + 1.79
1.86 - 2.58 HD Min. 1.86 x screen width – 3.95
2.65 - 4.0 HD Min. 2.65 x screen width +11.33
4.5 - 6.7 HD Min. 4.5 x screen width + 10.664

Divide max throw by 1.33 for VariScope min throw for 1.78 to 2.35 screen

Throw Distance Calculation for DCX-FD

Throw Distance measured from screen to front of Projector
1.45 - 1.8 HD Min. 1.45 x screen width + 12.04
1.86 - 2.58 Min. 1.86 x screen width +6.3
2.65 - 4.0 HD Min. 2.65 x screen width +21.58
4.5 - 6.7 HD Min. 4.5 x screen width + 20.9

Divide max throw by 1.33 for VariScope min throw for 1.78 to 2.35 screen

### Throw Distance Calculation for DCX-i and DCX-FD VariScope 2.35

Throw Distance measured from screen to front VariScope housing
1.45 - 1.8 HD Min. 1.45 x screen width + 12.04
1.86 - 2.58 HD Min. 1.86 x screen width +6.3
2.65 - 4.0 HD Min. 2.65 x screen width +21.58
4.5 - 6.7 HD Min. 4.5 x screen width + 20.9

Divide maximum throw by 1.12 for VariScope minimum throw for 1.78 to 2.35 or larger screen.

SYSTEM INTEGRATION

The GPIO (General Purpose Input Output) connector located on the input panel provides a flexible method of interfacing a wide range of external I/O devices to the projector. There are seven GIO pins available on the nine-pin D-Sub GPIO connector, which are configurable via RS232 commands. The other two pins are reserved for ground and power – see table below for pin identification.

GPIO Pins	GPIO
Pin #	**Signal**
1	+ 12V (1200mA)
2	GPIO 1
3	GPIO 2
4	GPIO 3
5	Ground
6	GPIO 4
7	GPIO 5
8	GPIO 6
9	GPIO 7

The serial cable required for connecting the external device to the projector's GPIO connector, whether it's a standard serial cable or a custom one, must be compatible with the external device.

CONFIGURING THE GPIO

The GPIO connector can be configured to automate any number of events using the serial command code GIO. Each pin is defined as either an input or output depending on the desired outcome. In general, configure the pin as an input if you want the projector to respond to something the external device does and as an output if you want the external device to respond to an action taken by the projector. For example, configure the pin as an output if you want the lighting in a room to automatically dim when the projector is turned on.

By using the GIO command, you can also set the state of each pin as high or low. By default, the state of each pin is high. The voltage applied to pins in the high state is + 3.3V.

Example 1. Turn room lighting on when the projector is turned off. *(Assumes a control/ automation unit is configured to turn the lights on when pin 2 of its input goes high.)*

(GIO C2 O)	*Set pin #2 configuration to output*
(GIO 2 H)	*Set pin #2 to high (state)*

Query Command

(GIO?)	*Request the state and configuration of all pins*
(GIO! "HHLLHLH" "OOIOOOI")	*Reply of pin state and configuration*
(GIO? C2)	*Request configuration for pin #2*
(GIO! C2 O)	*Reply with pin #2 configuration as output*
(GIO? 2)	*Request the state of pin #2*
(GIO! H)	*Reply with pin #2 state as high*

REAL TIME EVENT

Use the serial command RTE to specify an action that is initiated at a particular time or based on an external stimulus.

For General Purpose IO "G"

| Parameter	Name	Value
P1	RTE type	G (Real Time I/O Event)
P2	I/O bit	1-7
P3	Pin state (1 Character) (String)	H = High L = Low "LHXXXHL" Combine multiple inputs and trigger occurs when all conditions are met
P4	Commands	Any valid serial protocol command for the device

Example 2. Projector powers up when a switch on the external device is turned on.

(GIO C2 I)	*Set pin #2 configuration as input*
(RTE G 2 H "(PWR 1)")	*Power on when pin #2 set to high*
(RTE G 2 L "(PWR 0)")	*Power off when pin #2 set to low*

OPTIONAL INPUT MODULES

DVI Input Module

This module can display digital video input signals conforming to the DVI (Digital Visual Interface) single-channel standard.

DVI Input Module

INPUT   OUTPUT
FEATURES
  • Supports Digital Visual Interface (DVI) single-channel
  • Supports VESA® Extended Display Identification Data (EDID™)
  • Provides an active-loop-through using a DVI connector (conforming to the DVI Specification)

Serial Digital Input Module

The module accepts a serial digital 4:2:2 component video signal (YCbCr) via a single **SERIAL IN** BNC connector. The signal can loop through the **SERIAL OUT** BNC out to another device (such as another projector). Inputs are 75Ω terminated.

Serial Digital Input Module 804602

ERROR   SIGNAL   SERIAL IN   SERIAL OUT
SDI FEATURES
  • Accepts serial digital 4:2:2 component video (YCbCr)

  • Provides both a SERIAL IN and a SERIAL OUT BNC connector includes status LEDs for signal and error

  • SMPTE 259M compatible

Dual SD/HD-SDI Module

The *Dual SD/HD-SDI Module* enables incoming serial digital (SD or HD) data to be tiled across multiple screen displays, overlapped for extra-bright displays, or distributed to additional projectors for multiple, same-image screens.

SD / HD IN — ACTIVE — 1 — SIGNAL — 2   SD / HD OUT — LOOP FROM 1 — 1 — LOOP FROM 2 — 2

Dual SD/HD-SDI 38-804656
DUAL SD/HD-SDI FEATURES
  • Accepts and decodes up to two serial digital inputs

  • Outputs up to two 10-bit YCbCr 4:2:2 video signals

  • Provides input(s) to output(s) loop-through capability

  • Supplies interchangeable inputs as part of the Picture-in Picture display

  • SMPTE 259M compatible

FAN BOARD

Pin-out and Connection Options

Wiring Diagram
Pin-out and Connection Options			
Pin-outs		**Connections Options**
