# INTRODUCTION

## Metal Face Seals

For more than 60 years industrial original equipment manufacturers and equipment users have turned to Cat® Seals to protect their components from extreme, abrasive, and corrosive environments. Caterpillar is the leading manufacturer of metal face seals providing the best solutions for tough applications. Cat Seals innovative designs and engineering protect a broad range of equipment and machinery working in adverse conditions such as mud, rock, sand, chemicals, water, heat and cold.

Cat Seals are proven to provide long service life with low maintenance resulting in increased equipment up time, productivity and customer satisfaction.

Caterpillar offers Cat Duo-Cone and Heavy Duty Dual Face seals. Both designs use various elastomeric load rings and various seal ring material. Cat Duo-Cone seals require less space radially and Heavy Duty Dual Face seals require less space axially in a housing. Cat Duo-Cone seals incorporate a round toric while Cat Heavy Duty Dual Face seals have a trapezoidal Belleville Washer.

## Protecting Products

Cat Seals provide protection for internal working components like bearings and gears in abrasive applications and permit the use of oil as a lubricant instead of grease resulting in less friction and longer life. In most applications, the lubricant installed at the factory is permanent with no periodic lubrication or adjustment required.

Unscheduled equipment down time is very costly. Cat Seals provide superior performance in extreme applications where lubricant retention and protection from damaging surroundings is essential. Years of proven field experience has shown Cat Seals provide long life in many applications. Manufacturers in a variety of industries have utilized Cat Seals in their equipment for decades.

## Design

The design of a Cat seal compensates for many manufacturing and operating variables. Two metal sealing rings float in position; two elastomeric torics or Belleville washers exert uniform pressure to accurately position the metal rings and serve as the static seal between the housing and the seal ring. The load rings also transmits the turning torque from the drive housing to the seal ring.

## Cat Seals Features

- Corrosion-resistant seal rings
- Precision machined, self-renewing sealing surfaces
- Minimum face load variations
- Special seal and load ring materials to match application requirements

Rotating speed, lubrication, temperature, and differential pressure are factors to consider when determining seal face loads. Cat Seals provide good performance across a wide range of face loads, therefore, compensating for considerable assembly tolerance buildup, misalignment, and wear.

## Long Life

Extensive laboratory and field testing has confirmed Cat Seals last much longer than other radial lip seals. Used for decades by manufacturers of heavy construction equipment, Cat Seals have reached over 30,000 hours of operation without maintenance, in some applications. As wear occurs, machined metal seal faces are automatically and continually renewed.

## Problem Solver

The high cost of equipment downtime requires the best quality seal available. The Cat seal provides superior performance in extreme applications where lubricant retention and the ability to keep out damaging and/or abrasive materials are essential. Construction, mining, industrial, forestry, petrochemical, paper, agriculture, sewage treatment, landfill, and many more applications are all examples where Cat Seals have improved bearing protection and overall performance.

## Application Engineering

Caterpillar Engineers are available to understand and analyze your sealing requirements, work with your engineering department, and recommend the Cat seal that will best meet your needs. You need only complete an application data sheet (found at [www.cat.com/cat-seals](http://www.cat.com/cat-seals)) and provide drawings of the area containing the seal.

# PRODUCT DESIGN REVIEW

## Seal Ring Materials

Caterpillar offers the widest choice of seal ring and elastomeric material options in the industry. The materials have been engineered to excel in the many different applications in which Cat Seals are integrated.

*For further information on any seal ring material please consult Caterpillar at [catseals@cat.com](mailto:catseals@cat.com)*

Shown below is a general comparison between seal ring materials available.

	<b>C6</b>	<b>Stellite</b>	<b>NiHard</b>	<b>Formed</b>	<b>Forged</b>
<b>Material</b>	Nickel-Alloy	Iron-Alloy	Iron-Alloy	SAE 1074	SAE 52100
<b>Process</b>	Cast	Cast	Cast	Stamped	Forged
<b>Wear Life</b>	High	High	Low/Medium	Low	Low
<b>Corrosion Resistance</b>	High	Medium/High	Low/Medium	Medium	Low
<b>Scoring Resistance</b>	High	Low	Medium/High	Low	Low

### **C6**

C6 was developed for applications that require high speed and superior corrosion resistance. This alloy offers greater speed capabilities over Stellite with higher resistance to scoring, wear, and corrosion. The C6 alloy is available only from Caterpillar. It is the material of choice around the world in large diameter wheel applications.

### **Stellite**

Stellite has been designed for the harshest operating environments where abrasive and corrosive elements are present. Stellite's formulation is iron based with a high alloy content designed to provide better corrosion resistance. Stellite cast seals are typically found in applications frequently exposed to abrasive and corrosive conditions with moderate rotational speeds. Typical applications include crawler tractor final drives and various undercarriage applications.

### **NiHard**

NiHard is another iron based casting alloy offered by Caterpillar. Pressure velocity characteristics are slightly greater than Stellite, but wear life and corrosion resistance have shown to be less, in tests conducted by Caterpillar. Typical applications would include undercarriage and final drive applications where corrosion resistance is not essential, but seal surface speeds prohibit the use of Stellite.

### **Formed (Cat Duo-Cone only)**

Formed seals were developed for applications that do not require the high levels of corrosion and abrasion resistance, but the versatility of a face seal is desired. Formed seals are used extensively in axle, winch, and final drive applications. Formed seals are interchangeable with cast seal retainers, provide similar load and speed capability as the Stellite seals, at a significantly lower cost.

### **Forged**

Forged seals are available on a limited basis from Caterpillar. These seals have been used successfully on undercarriage applications where minor wear is present and seal cost is critical.

# PRODUCT DESIGN REVIEW

## Load Ring Materials

Several load ring materials are available to meet a variety of application requirements. The most common materials are Nitrile and silicone, while fluoroelastomer (FKM) and Hydrogenated Nitrile (HNBR) are available for more specialized applications. The table below provides a brief comparison between Cat Seals load ring options.

	Nitrile	LT-NBR	Silicone	HNBR	FKM
<b>Min Temp. (°C/°F)</b>	-17/1	-35/-31	-55/-67	-40/-40	-7/20
<b>Max Temp. (°C/°F)</b>	100/212	100/212	150/302	135/275	160/320
<b>Tear Resistance</b>	Medium	Medium	Low	High	Medium
<b>Abrasion Resistance</b>	Medium	Medium	Low	High	Medium
<b>Oil Resistance</b>	Medium	Medium	Low	High	Superior
<b>Water Resistance</b>	Superior	Superior	Superior	Superior	Medium

## Nitrile (NBR)

Nitrile is compatible with most mineral-based lubricant oils and offers the maximum resistance to abrasion. It is the most common load ring material choice and is used in most standard axle, final drive, and undercarriage applications.

## Low-Temperature Nitrile (LT-NBR)

Low-temperature Nitrile was specifically developed for highly abrasive, low-temperature applications. Typical applications include undercarriage idlers, rollers and final drives.

## Silicone

Silicone uses are extreme high (wet disc brake systems) or extreme low (arctic environment) temperature applications.

## Hydrogenated Nitrile (HNBR)

Hydrogenated Nitrile is a Nitrile-based material and has very similar abrasion resistance characteristics to standard Nitrile, but Hydrogenated Nitrile has better temperature resistance to permanent deformation.

## Fluoroelastomer (FKM)

FKM is a fluoroelastomer and is typically used where extremely high temperatures are a concern and low temperatures are never a problem.

# PRODUCT DESIGN REVIEW

## Seal Group Size (Class) Options

Seals are available in various radial cross sections with toric sections from 4.30 to 16.00 mm (0.170" to 0.630"). Always specify the largest toric/seal group section that can be accommodated in the housing design envelope. Larger section torics will accommodate greater deflection and are less sensitive to tolerances and environmental effects. The table shown below gives a brief summary of available design options.

Class	Toric Size (mm)	Seal Ramp Angle (°)	Housing Ramp Angle (°)	Common Application
A	4.30	20	15	Specialized
B	6.22	15	10	Small Axles and Wheels
C	9.47	8/15/20	10	Undercarriage
D	12.70	8/15/20	10	Large Axles, Wheels, Final Drives
E				Specialized
K	BW	Load Ring	Square Bore	Square Bore All Applications
L	16.00	15	10	Large Wheels

### Class A - 4.30mm (0.17")

Cat Duo-Cone seals utilizing the 4.30 mm cross-section toric ring have very limited applications. They are used in small diameter applications with extreme axial and radial spacial and tolerance constraints (e.g. cartridge pins). Seals of this type have very little end play capability.

### Class B - 6.22mm (0.24")

Cat Duo-Cone seals with 6.22 mm cross section toric rings are typically used in small axle or rock bit applications. They are used where sealing is needed in extreme environments, but where there is insufficient space to put a larger (and more typical) cross section Cat Duo-Cone seal. While these seals do have some end play capability, they have less than seals utilizing larger cross section load rings.

### Class C - 9.47mm (0.37")

9.47 mm cross-section Cat Duo-Cone seals are typically used in moving undercarriages for crawler tractor and excavator applications. These seals have good end play capability. Seals are available with 8°, 15°, and 20° seal ramps to serve different operating environments.

### Class D - 12.70mm (0.50")

This style Cat Duo-Cone seal is very common in axle, wheel, and final drive applications in construction and earth moving equipment. These seals have very good end play capability. Seals are available with both 8°, 15°, and 20° seal ramps for optimized performance in your application.

### Class L - 16.00mm (0.63")

Currently, the largest cross section toric ring offered by Caterpillar, the 16.0 mm cross section diameter Cat Duo-Cone seal is for the largest of sealing applications.

### Class E - Inverted Cat Duo-Cone Seals

Inverted Cat Duo-Cone Seals specialized design for spacial restraints, used for large shaft clearance.

### Class K - Cat Heavy Duty Dual Faced Seals

The Cat Heavy Duty Dual Faced Seal uses a square bore housing design and a Belleville Washer load ring to provide loads to the metal seal faces. This seal is designed for demanding environments and is available in many sizes. Because of the design, there is no rolling of the loading member. This seal type is used in a wide variety of products, including undercarriage, axles, final drives, gear boxes, wheels, etc.

Contact Caterpillar with your seal class questions at [catseals@cat.com](mailto:catseals@cat.com)

# PRODUCT DESIGN REVIEW

## Cat Duo-Cone Seal Ramp Angles

A unique feature of Cat Duo-Cone seals is the changing of sealing ramp angles to tailor the seal to various operating environments. Below is a brief summary of the purpose of various ramp angles.

### 8° Seal Ramp

Cat Duo-Cone seals with 8° seal ramps were originally developed for applications that are exposed to high-pressure differentials. This design offers increased toric retention and a more linear face load profile over its range of operation. The 8° Cat Duo-Cone seal is available in both cast alloy and formed steel designs. Formed Cat Duo-Cone seals are interchangeable with cast Cat Duo-Cone seal retainers.

### 15° Seal Ramp

The 15° Cat Duo-Cone seal is the most common design offered by Caterpillar. This sealing design offers resistance to internal operating pressure and is most commonly used in final drive, axle, and wheel applications.

### 20° Seal Ramp

Similar to the 15° seal design in that it resists internal pressures. The 20° design produces less compression on the toric and because of its bore requirements being shallow, requiring less room axially in its application, the 20° seal ramp is commonly found in undercarriage applications.

*Contact Caterpillar with your seal questions at [catseals@cat.com](mailto:catseals@cat.com)*

# DESIGN INFORMATION

## Load Deflection

The combination of the seal ring flange thickness and gage diameter or Heavy Duty Dual Faced Seals inner diameter and elastomeric materials dictate the allowable operating conditions the seal can be used in. The sealing system, the nominal Duo-Cone gap between housings or HDDF operating range and axial tolerance stack will ensure the seal will perform. The Cat seal options are based on those operating conditions. *Caterpillar Engineering should be consulted at catseals@cat.com for proper seal selection and design.*

## Speed Capability

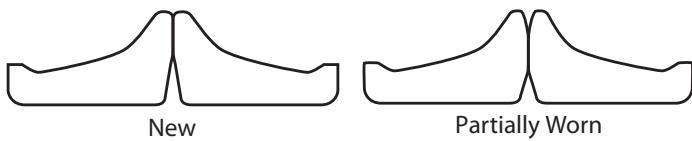

The face load required to keep the metal seal rings in contact is related to the targeted speed of the application. Many factors influence this relationship, including seal ring material, seal ring diameter, operating temperature, lubricant viscosity, differential pressure across the load rings and action of centrifugal force on the load ring.

In low speed applications or with light lubricants, face pressures are generally increased to ensure seal ability. The same is true when seals are exposed to high differential pressures and/or large end play or deflections. Lower face loads are specified for applications producing high rotational speeds or high ambient outside temperatures.

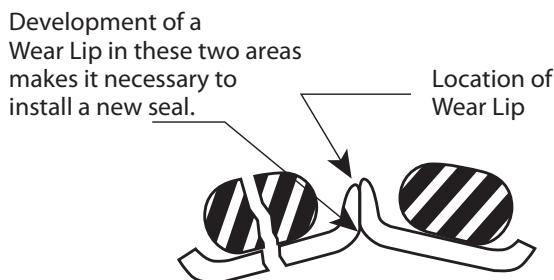

High speeds produce high temperatures which deteriorates lubricant and changes the properties of the elastomer load rings. Depending on the cavity design, high speeds can centrifuge lubricant away from the seal face. All conditions can contribute to adverse sealing effects. *Consult Caterpillar at catseals@cat.com when selecting face load to ensure appropriate design target for your desired speed.*

## Seal Wear Measurement

Cast Cat Seals automatically compensate for wear. The mating faces form a contact band approximately 0.5 (0.02") to 1.0 mm (0.04") wide that retains the oil lubricant and seals out all foreign material. As wear occurs, the contact band will widen slightly and migrate inward until the inside diameter is reached. As depicted in the figure, the cast seals wear down the tapered surface.

Formed seals are more flexible than cast seals and as a result will produce a different wear pattern than cast rings. Typically, formed seals wear in an axial rather than radial direction, as depicted below, due to their increased flexibility.

## Lubricant Requirements

Cat Seals are a mechanical face sealing technology that require lubrication. Oil lubricant should be used with all Cat Seals. Mineral base oils ranging from 10WT to 90WT are commonly used, depending on temperature requirements. Extreme pressure gear lubricants should be used with caution, as some additive packages are not compatible with polymers.

In some slow rotating or oscillating applications, certain types of grease may be used, but mineral base oils are always preferred.

*Contact Caterpillar for additional information at catseals@cat.com*

Oil not only provides lubrication to the sealing faces, but also serves to cool the seal rings. Lubricants are recommended to cover a minimum of one third of the sealing surface, depending on the diameter of the seal, to properly lubricate and cool the rings. Cat Seals work best in clean, closed systems. To allow adequate volume for thermal expansion, non-vented cavities should not be filled more than 90% full. Maximum care should be taken to ensure lube cavities are clean at assembly – free from dirt, scale and other foreign materials.

# DESIGN INFORMATION

## Lubricant Viscosities for Ambient (Outside) Temperature Ranges

Oil Viscosity	°C min	°C max	°F min	°F max
10W	-30	0	-22	+32
30W	-20	+25	-4	+77
40W*	-10	+40	+14	+104
50W	0	+50	+32	+122
80W/90**	-20	+40	-4	+104
85W/140**	-10	+50	+14	+122

\* Commercially available CD/TD-2 oils that meets requirements

\*\* EP gear lubricants should not be used with seals having silicone torics. Consult with Caterpillar before specifying an API GL-5 or MIL-L-2105C type lubricant.

NOTE: Arctic Lubricants – For operation with ambient temperatures below -20°C (-4°F), use oils with base stocks that have low temperature flow capabilities. Use oils with a CD/TO-2 rating. If the application requires API GL-5 gear oil, use the EP synthetic gear lubricants that are available. Low temperature lubricants are not recommended for temperatures above 0°C (+32°F). When operating temperatures reach 0°C, the oil should be changed to one of the lubricants indicated above.

## Specialty Seals

Caterpillar not only offers “off-the-shelf” designs – our team is also available to work with your engineers to design customized or application specific Cat Seals. Whether developing a new seal size or type to fit your application, or integrating a new metal seal or load ring material, Caterpillar Engineers have the experience necessary to design, procure and test these concepts then produce them.

## Product Comparison

In most applications, either Cat Duo-Cone or Heavy Duty Dual Face seals can be utilized. However, there are specific advantages to both designs. These should be considered when designing a Cat seal into your application:

### Cat Duo-Cone Seal

- Requires less room radially in application
- Very stable in housing prior to final assembly
- Very good end play capability

### Cat Heavy Duty Dual Face Seal

- Requires less room axially in application
- Square bore housing cavity design
- No assembly tool or lubricant required

## Supplying Quality

We know quality is important to you and we take pride in supplying our customers highly reliable and durable products. The manufacturing quality of Cat Seals is ensured by our ISO 9001: 2008 accreditation.

## Testing

Caterpillar laboratories are equipped with the latest technologies and testing procedures for development and validation of new seal designs. *Contact Caterpillar for testing options at catseals@cat.com*

## Reliability Testing

Reliability testing is used for evaluating the operating conditions of the specific seal application including the following: seal face loads, internal operating temperatures, internal operating pressures, rotational speeds, etc. and evaluate the performance of the seal to determine a metal seal ring material's resistance to failure. This test method also determines the maximum speed at which the seal group can perform.

## Load Testing

Load tests evaluate the loading characteristics of the elastomeric ring for a given size. This information is used to determine the load ring compression required to obtain optimal loading on the metal seal faces.

## Accelerated Wear Tests

Accelerated wear testing employs equipment to evaluate a seal ring material's resistance to abrasive wear. Seals are assembled and submerged in a unique slurry to accelerate the wear process. Wear is quantified by the amount of movement of the sealing band during the test.

## Oil Compatibility Testing

Oil compatibility testing evaluates the effects from exposure with the intended system lubricant and compression level of the system design. This procedure will indicate the rate at which the elastomer will relax during operation and cause a change in load at the seal group interface. The test guides Caterpillar Engineers to identifying the correct load to design for maximum seal life.

*Contact Caterpillar Engineering to identify correct oil compatibility at catseals@cat.com*

# DESIGN INFORMATION

A properly installed Cat seal creates a robust system performing without premature failure. The following considerations should be addressed when designing your system.

## Uneven or Excessive Face Load

The seal ring is tilted in the retainer or the toric is twisted result in improper seal installation and can cause uneven loads at the seal interface. This uneven loading can result in premature failure.

## Mishandling of Seals

Mishandling of seals can lead to an immediate leak or premature failure. Failure can occur due to cutting or tearing of the elastomeric load ring, breakage of the sealing ring, contamination of the seal face with dirt or lint, etc. When assembling Cat Seals, please carefully observe assembly instructions provided by Caterpillar.

## Internal Pressure Spikes

Cat Seals can withstand a varying amount of system pressure, depending on the design. If your application requirements include pressure capability, consult Caterpillar Engineering at [catseals@cat.com](mailto:catseals@cat.com)

## Improper Housing Design

It is critical that the application seal housing conform to the design information provided by Caterpillar. The relationship between the seal assembly and its mating component is essential to the performance of the sealing system.

## The Proper Selection of Oil

Improper selection of oil can have an adverse effect on both the load ring and metal sealing ring. Some oils are incompatible with elastomers and cause long-term degradation with exposure, especially when combined with heat. Improper oil selection can cause metal seal failure due to galling from inadequate lubrication flow.

## Mud Packing

Mud packing is a common issue in environments where the Cat Seals are continually exposed to dirt and mud. Debris can pack the cavity between the seal housing, seal ring and load ring. Over time, this can cause the load ring to be pushed out of position.

Seal guarding and labyrinth can prolong seal life if applied correctly. Poor labyrinth application can trap debris against the seal and lead to wearing away of the seal housings.

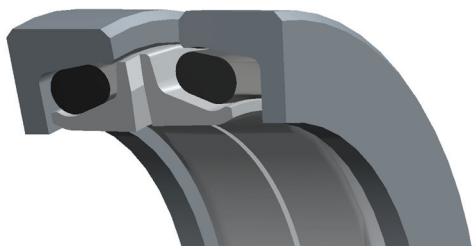

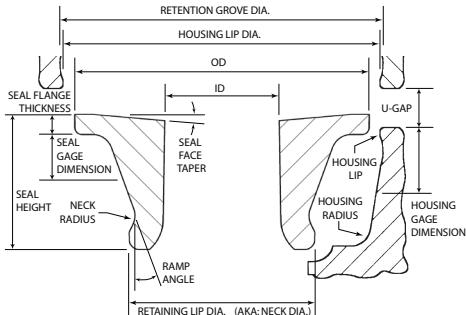

*If your application requirements include resistance to excessive debris, contact Caterpillar at [catseals@cat.com](mailto:catseals@cat.com)*

## Load Ring Abrasion

Abrasion of the load ring can occur in applications where it is exposed to abrasive conditions like corrosive, dusty, dirty, sandy, and rocky. Abrasion of the load ring causes deterioration and tearing of the elastomer, leading to failure. This can be minimized through proper load ring material selection.

*Consult Caterpillar to discuss your seal load ring options at [catseals@cat.com](mailto:catseals@cat.com)*

# CAT DUO-CONE SEALS INSTALLATION

## Cat Duo-Cone Seal Assembly

### Contents:

- (2) Metal Seal Rings
- (2) Elastomeric Toric Rings

### Terminology

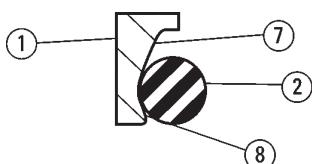

### Handling the Seals

The idea is to protect the seal face. The more precautions taken, the more likely the seals will last in the field.

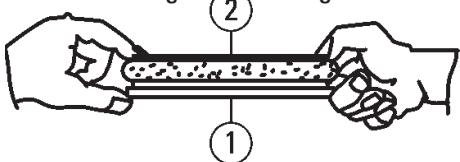

### Housing Preparation

The housing components that contact the rubber toric rings (3 and 4) must be free from foreign material (oil, grease, dirt, metal chips, dust or lint particles, etc.) before installing the seal. The housing should be cleaned using a lint-free wipe and a non-petroleum based solvent. Dry with a clean wipe.

Remove any foreign material from the rubber torics (2), the ramps (7) and the lips (8) of both seal rings. This should also be done with a lint-free wipe and a non-petroleum based solvent. Dry with a clean wipe.

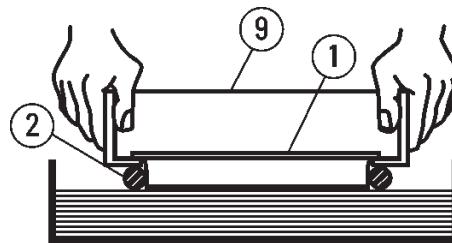

Place the rubber torics on the metal seal ring at the bottom of the seal ring ramp and against the retaining lip.

Make sure the rubber toric is straight on the seal ring and not twisted. Be careful not to nick or cut the torics during the assembly, as this can cause leaks.

Put the installation tool onto the metal seal ring and rubber toric. Lightly dampen the lower half of the rubber toric with the appropriate assembly lubricant.

Techniques to dampen the toric include wiping with a lint-free towel, lubricating using a clean foam brush, or dipping in a container lined with towels saturated in the assembly lubricant (as shown).

Seal groups with silicone torics can be assembled using a freezer to slightly contract the toric rings. Seal groups should be placed in a freezer for 5 minutes at -40°C to -18°C prior to installation. Contraction will be sufficient to allow installation. Groups should warm to room temperature prior to further assembly.

### Approved Assembly Lubricants

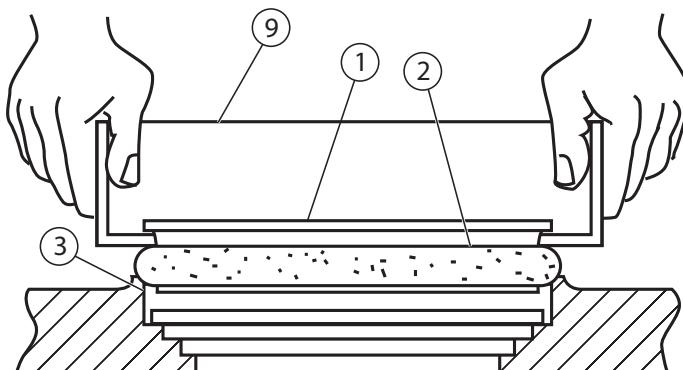

- Isopropyl Alcohol\*
- Houghto-Grind 60 CT
- Quaker® Solvo Clean 68-RAH

(\* All applicable safety and disposal guidelines for flammable liquids must be followed.

Note: Do not use Stanosol or any other liquid that leaves an oil film and/or does not evaporate quickly.

### Installation Process

With the lower half of the rubber toric still wet, use the installation tool to position the seal ring and the rubber toric squarely against the application housing (as shown).

# CAT DUO-CONE SEALS INSTALLATION

For smaller diameter seals, use sudden and even pressure to push the rubber toric under the retaining lip of the housing. For larger diameter seals, which will not press in with sudden and even pressure, it is acceptable to work the toric past the retaining lip by starting one side and tapping the opposite side of the installation tool with a rubber mallet until it is engaged past the retaining lip of the housing.

Check the assembled height variation (A) in at least four places, 90° apart, use a caliper, toolmakers' ruler or any other calibrated measuring device.

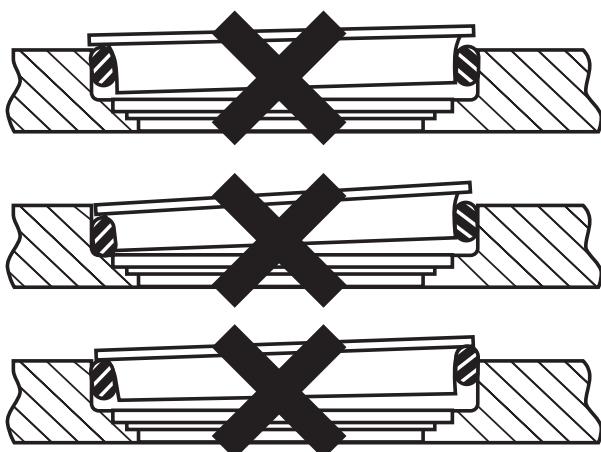

The difference in height around the ring must not be more than 1.0 mm. If small adjustments are necessary, do not push or pull directly on the seal ring. Use the installation tool to push down and your fingers to pull up uniformly on the rubber toric and seal ring.

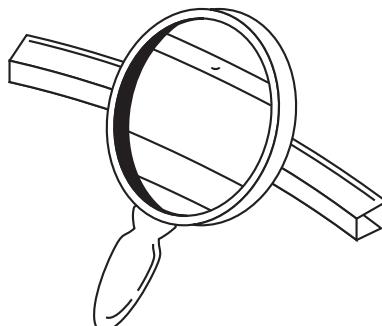

The rubber toric can twist if it is not wet all around during installation or if there are burrs or fins on the retaining lip of the housing. Twists, misalignment, and bulges of the toric (as shown) will result in seal failure. If correct installation is not obvious, remove the seal from the housing and repeat process.

The rubber torics must never slip on the ramps of either the seal ring or the housing. To prevent slippage, allow adequate evaporation time for the lubricant before proceeding with further assembly.

Once correctly in place, the rubber toric must roll on the ramp only. The following shows incorrect installations resulting in cocked seals.

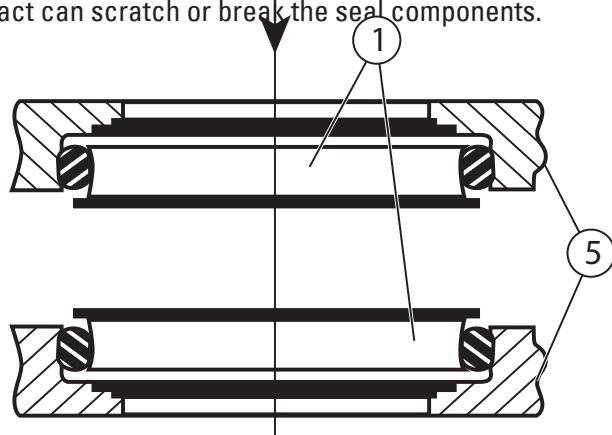

Wipe the face of each seal ring using a lint-free wipe. No particles of any kind are permissible on the sealing surfaces. (Even a hair can hold the seal faces apart and cause a leak)

Apply a thin film of oil on the entire seal face of one or both seals using a lint-free applicator. Oil must not contact surfaces other than the sealing face.

## Final Assembly

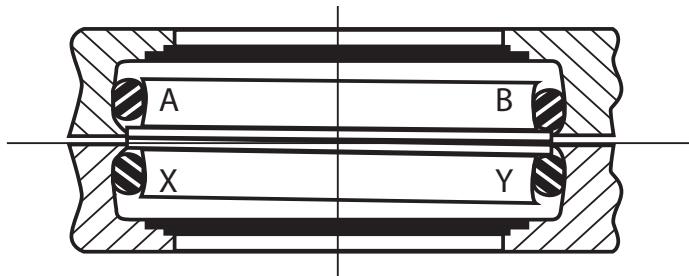

While completing the final assembly of the unit, make sure that both housings are in correct alignment and are concentric. Slowly bring the two housings together. High impact can scratch or break the seal components.

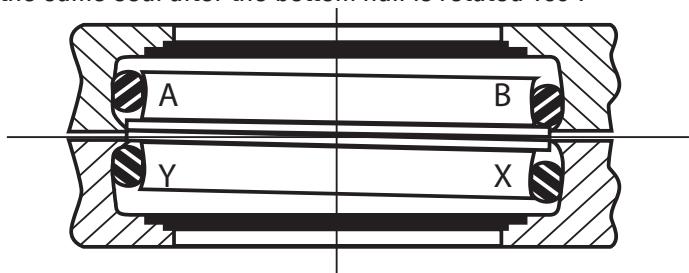

If the rubber toric slips at any location, it will twist, causing the seal rings to cock. Any wobbling motion of the seal is an indication of cocked seals and can cause dirt to enter by pumping mud past the torics.

# CAT DUO-CONE SEALS INSTALLATION

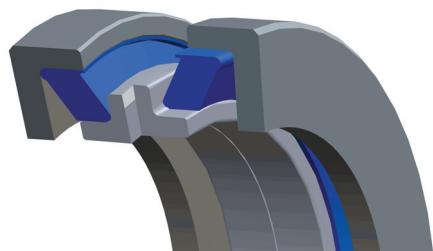

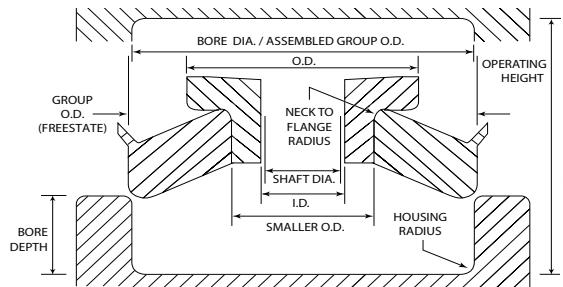

The following examples show the effects of a cocked seal group.

The above depicts how the torics have slipped instead of rolling on the left hand side of the seal. The following shows the same seal after the bottom half is rotated 180°.

# CAT HEAVY DUTY DUAL FACED SEALS

Class K Cat Heavy Duty Dual Faced Seals uses a square bore housing design and a Belleville Washer load ring to provide loads to the metal seal faces.

# CAT HEAVY DUTY DUAL FACED SEALS INSTALLATION

## Cat Heavy Duty Dual Face Seal

### Assembly Contents:

1. (2) Metal Seal Rings
2. (2) Rubber Belleville Washers

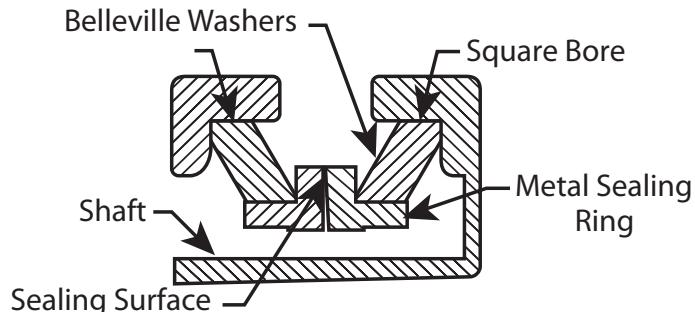

### Service Kit Contents:

1. (1) Seal Group
2. Installation Instruction

### Field Kit Contents:

1. (2) Rubber Belleville Washers
2. Installation Instructions

### Terminology

### Handling the Seals

The idea is to protect the seal face. The more precautions taken, the more likely the seals will last in the field.

### Housing Preparation

The housing components that contact the Belleville Washers must be free from foreign material (oil, grease, dirt, metal chips, dust or lint particles, etc.) before installing the seal. The housings should be cleaned using a lint-free wipe and a non-petroleum base solvent. Dry with a clean wipe.

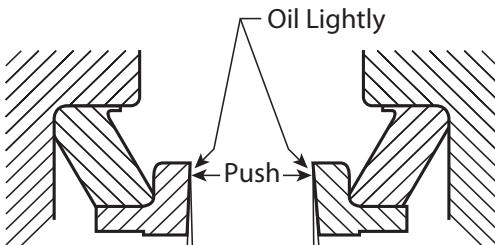

Seal rings must be handled with care. Machined seal faces must not be damaged or scratched. All parts are to be free of grease, oil, dirt and scale.

### Seal Preparation

The Belleville washer should be installed with the inside diameter radius in contact with the neck to flange radius of the seal ring.

### Installation Process

Install each half seal (Belleville Washer and sealing ring) into the housing by carefully pushing on the seal half until it is fully seated. Using a non petroleum based solvent (isopropyl alcohol is recommended) on the Belleville Washer can help ensure the seal slides all the way into the bore. Check to be sure that the seal is not cocked and that the washer is seated evenly at the bottom of the bore. If the seal is a single barb design, the barbed half goes in the suspended housing to ensure no movement of the seal half during the assembly process.

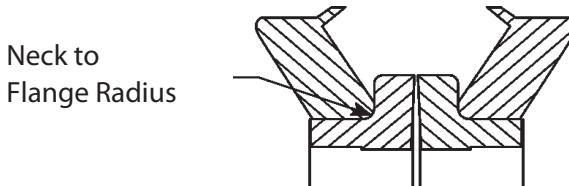

After installing the seal halves into the unit, wipe both metal sealing faces clean with a lint-free wipe. Apply a thin film of oil to the sealing faces with a lint free applicator. Oil must not contact surfaces other than the sealing faces.

### Final Assembly

While completing the final assembly of the unit, make sure that both housings are in correct alignment and are concentric. Observe carefully that the rubber rings do not unseat from the bottom of the housing. Slowly bring the two housings together. (High impact can scratch or break the seal components)

To set the seals, hold one-half of the assembly stationary while rotating the other member a minimum of ten complete revolutions. This is very important!

# APPLICATION DATA SHEET
