7 GES Metrics ..... 104

## Making Preparations

Before using GES, register a HUAWEI CLOUD account.

## Registering a HUAWEI CLOUD Account

Skip this step if you already have registered one.
Step 1 Log in to the HUAWEI CLOUD official website.
Step 2 Click Register in the upper right corner to enter the registration page.
Step 3 Complete the registration as instructed. For detailed operations, see Account Registration Process.
----End

## 2 <br> Permissions Management

### 2.1 Creating a User and Granting Permissions

This section describes how to use IAM to implement fine-grained permissions control for your GES resources. With IAM, you can:

- Create IAM users for employees based on the organizational structure of your enterprise. Each IAM user has their own security credentials, providing access to GES resources.
- Grant only the permissions required for users to perform a specific task.
- Entrust a HUAWEI CLOUD account or cloud service to perform professional and efficient O\&M on your GES resources.

If your HUAWEI CLOUD account does not need individual IAM users, then you may skip over this chapter.

## Prerequisites

- GES ReadOnlyAccess is a policy.
- Learn about the permissions (see GES System Permissions) supported by GES and choose policies or roles according to your requirements.

## Process Flow

This section describes how to use a group to grant permissions to a user. Figure 2-1 shows the process for granting permissions.

Figure 2-1 Process for granting GES permissions

1. Create a user group and assign permissions to it.

Create a user group on the IAM console, and assign the GES ReadOnlyAccess policy to the group.
2. Create an IAM user.

Create a user on the IAM console and add the user to the group created in 1.
3. Log in as the user and verify permissions.

Log in to the GES console using the newly created user, switch to the authorized region, and verify the user's permissions.

- Choose Service List > Graph Engine Service to enter the GES management console, and click Create Graph in the upper right corner to create a graph. If you cannot create one, the GES ReadOnlyAccess policy has taken effect.
- Choose any other service in Service List. If a message appears indicating that you have insufficient permissions to access the service, the GES ReadOnlyAccess policy has already taken effect.

### 2.2 Creating a GES Custom Policy

Custom policies can be created as a supplement to the system policies of GES. For the actions supported for custom policies, see Permissions Policies and Supported Actions.
You can create custom policies in either of the following two ways:

- Visual editor: Select cloud services, actions, resources, and request conditions without the need to know policy syntax.
- JSON: Edit JSON policies from scratch or based on an existing policy.

For details, see Creating a Custom Policy.

## Example Policies

- Example 1: Allowing users to query and operate graphs

```
{
            "Version": "1.1",
            "Statement": [
            {
                "Effect": "Allow",
            "Action": [
                    "ges:*:get*",
                    "ges:*:list*",
                    "ges:graph:operate"
            ]
        }
    ]
}
```

- Example 2: Denying graph deletion

A deny policy must be used in conjunction with other policies to take effect. If the permissions assigned to a user contain both Allow and Deny actions, the Deny actions take precedence over the Allow actions.
The following method can be used if you need to assign the GES FullAccess policy to a user but also forbid the user from deleting graphs. Create a custom policy for denying graph deletion, and assign both policies to the group the user belongs to. Then the user can perform all operations on GES except deleting graphs. The following is an example deny policy:
\{

```
    "Version": "1.1",
    "Statement": [
        {
        "Effect": "Deny",
            "Action": [
                "ges:graph:delete"
            ]
        }
    ]
```

\}

- Example 3: Authorizing users to operate graphs whose name prefix is ges_project (ges_project names are case insensitive) and access the graph list
\{
"Version": "1.1",
"Statement": [
\{
"Effect": "Allow",
"Action": [
"ges:graph:create",
"ges:graph:delete",
"ges:graph:access",
"ges:graph:getDetail"
],
"Resource": [
"ges:.*:graphName:ges_project*"
]
\},
\{
"Effect": "Allow",
"Action": [
"ges:graph:list"
]

```
    }
    ]
}
```

- Example 4: Authorizing users to operate some graph resources and view all resources
The policy consists of the following two parts:
- Part 1: Authorizing users to operate resources whose name prefix is ges_project. The resources include graphs, metadata, and backups.
- Part 2: Authorizing users to query the graph, backup, task, and metadata lists, verify metadata files, and view job details

"Version": "1.1",
"Statement": [
\{
"Action": [
"ges:backup:delete",
"ges:graph:access",
"ges:metadata:create",
"ges:graph:operate",
"ges:graph:delete",
"ges:metadata:delete",
"ges:graph:create",
"ges:backup:create",
"ges:metadata:getDetail",
"ges:graph:getDetail"
],
"Resource": [
"ges:*:*:backupName:ges_project*",
"ges:*:*:graphName:ges_project*",
"ges:*:*:metadataName:ges_project*"
],
"Effect": "Allow"
\},
\{
"Action": [
"ges:graph:list",
"ges:backup:list",
"ges:jobs:list",
"ges:metadata:list",
"ges:metadata:operate", "ges:jobs:getDetail"
],
"Effect": "Allow" \}
]
\}

### 2.3 GES System Permissions

## GES Permissions

By default, new IAM users do not have permissions assigned. You need to add a user to one or more groups, and attach permissions policies or roles to these groups. Users inherit permissions from the groups to which they are added After authorization, the users can perform specified operations on DLI based on the permissions.

GES is a project-level service deployed and accessed in specific physical regions. To assign DLI permissions to a user group, specify the scope as region-specific projects and select projects for the permissions to take effect. If All projects is
selected, the permissions will take effect for the user group in all region-specific projects. When accessing GES, the users need to switch to a region where they have been authorized to use GES.

- You can grant users permissions by using roles and policies.
- Roles are a type of coarse-grained authorization mechanism that defines permissions related to user responsibilities. Only a limited number of service-level roles for authorization are available. When using roles to grant permissions, you need to also assign other roles on which the permissions depend to take effect. However, roles are not the ideal choice for fine-grained authorization and secure access control.
- Policies are a type of fine-grained authorization mechanism that defines the permissions for performing operations on specific cloud resources under certain conditions. This mechanism allows for flexible policy-based authorization and meets requirements for secure access control. For example, you can grant CS users only the permissions for managing a certain type of cloud servers.
- Dependencies: HUAWEI CLOUD services interact with each other. Therefore, if a GES policy depends on the policies of other services, the permissions of GES take effect only after the dependent policies are granted to users. For details, see Table 2-1 and Table 2-2.

## [] NOTE

Because of the cache, it takes about 13 minutes for an OBS role to take effect after being granted to users and user groups. After a policy is granted, it takes about 5 minutes to take effect.

Table 2-1 GES roles

| Role Name | Description |
| :--- | :--- |
| Tenant Guest | Common tenant users <br> - Permissions: querying GES resources <br> - Function scope: Project-level service. |
| GES Administrator | GES administrator <br> - Permissions: performing any operations on GES <br> resources |
|  | - Function scope: Project-level service. <br> NOTE <br> If you have the GES Administrator, Tenant Guest, and Server <br> Administrator permissions, you can perform any operations on <br> GES resources. If fou do not have the Tenant Guest or Server |
| Administrator permissions, you cannot use GES properly. |  |
| - To bind or unbind an EIP, you must have the Security |  |
| Administrator permissions to create agencies. |  |
| - If GES needs to interact with OBS, such as creating and |  |
| importing data, OBS permissions are required. For details, see |  |
| Table 2-5. |  |

| Role Name | Description |
| :--- | :--- |
| GES Manager | GES manager <br> - Permissions: performing any operations on GES <br> resources other than creating and deleting graphs. <br> - Function scope: Project-level service. <br> NOTE <br> If you have both the GES Manager and Tenant Guest <br> permissions, you can perform any operations on GES resources <br> except for creating and deleting graphs. If you do not have the <br> Tenant Guest permissions, you cannot use GES properly. <br> - To bind or unbind an EIP, the users must have the Security <br> Administrator and Server Administrator permissions. <br> - If GES needs to interact with OBS, such as importing data, OBS <br> permissions are required. For details, see Table 2-5. |
| GES Operator | GES common users <br> - Permissions: viewing and accessing GES resources <br> - Function scope: Project-level service. <br> NOTE <br> If you have both the GES Operator and Tenant Guest <br> permissions, you can view and access GES resources. If you do not <br> have the Tenant Guest permissions, you cannot view resources or <br> access graphs. <br> If GES needs to interact with OBS, such as viewing metadata, OBS <br> permissions are required. For details, see Table 2-5. |

Table 2-2 GES policies

| Policy | Description |
| :--- | :--- |
| GES <br> FullAccess | Administrator permissions for GES. Users granted these <br> permissions can perform all operations on GES, including creating, <br> deleting, accessing, and updating graphs. <br> NOTE <br> - To bind or unbind an EIP, you must have the Security Administrator <br> permissions to create agencies. <br> - If GES needs to interact with OBS, such as creating and importing data, <br> OBS permissions are required. For details, see Table 2-5. |
| GES <br> Developm <br> ent | Use permissions for GES. Users granted these permissions can <br> perform any operations on GES except for graph creation and <br> deletion. <br> NOTE |
| - To bind or unbind an EIP, the users must have the Security |  |
| Administrator and Server Administrator permissions. |  |
| - If GES needs to interact with OBS, such as creating and importing data, |  |
| OBS permissions are required. For details, see Table 2-5. |  |

| Policy | Description |
| :--- | :--- |
| GES <br> ReadOnlyA <br> ccess | Read-only permissions for ECS. Users granted these permissions <br> can only perform resource querying operations, such as viewing <br> the graph list, metadata, and backups. <br> NOTE <br> If GES needs to interact with OBS, such as viewing metadata, OBS <br> permissions are required. For details, see Table 2-5. |

Table 2-3 Common GES operations supported by each role

| Operation | GES <br> Administrator | GES Manager | GES <br> Operator | Tenant Guest |
| :---: | :---: | :---: | :---: | :---: |

| Querying the task status | $\checkmark$ | $\checkmark$ | $\checkmark$ | - |
| Querying the task list | $\checkmark$ | $\checkmark$ | $\checkmark$ | - |

Table 2-5 Common GES operations supported by each OBS policy

| GES Operation | Dependent OBS Permission |
| :--- | :--- |
| Viewing metadata | OBS Viewer policy or OBS Buckets Viewer role |
| Creating/Importing/ <br> Copying/Editing/Deleting <br> metadata | OBS Operator policy or Tenant Administrator role |

| GES Operation | Dependent OBS Permission |
| :--- | :--- |
| Creating a graph (with <br> initial data), and <br> importing or exporting <br> the graph | OBS Operator policy or Tenant Administrator role |

### 2.4 GES Resources

A resource is an object that exists within a service. On GES, you can select these resources by specifying their paths.

Table 2-6 GES resources and their paths

| Specific <br> Resource | Name | Path |
| :--- | :--- | :--- |
| graphName | GES graph <br> name | graph.name |
| backupNam <br> e | GES backup <br> name | backup.name |
| metadataN <br> ame | GES metadata <br> name | metadata.name |

### 2.5 GES Request Conditions

Request conditions are useful in determining when a custom policy takes effect. A request condition consists of a condition key and operator. Condition keys are either global or service-level and are used in the Condition element of a policy statement. Global condition keys (starting with $\mathbf{g}$ :) are available for operations of all services, while service-level condition keys (starting with a service name such as ges) are available only for operations of a specific service. An operator is used together with a condition key to form a complete condition statement.

GES has a group of predefined condition keys that can be used in IAM. For example, to define an allow permission, you can use the condition key hw:Sourcelp to filter matching requesters by IP address. The following table shows the condition keys that apply to GES.

Table 2-7 GES request conditions

| Condition Key | Operator | Description |
| :--- | :--- | :--- |
| g:CurrentTime | Date and time | Time when an authentication <br> request is received <br> NOTE <br> The time is in ISO 8601 format, for <br> example, 2012-11-11T23:59:59Z. |
| g:MFAPresent | Boolean | Whether multi-factor <br> authentication is used during user <br> login |
| g:Userld | String | User ID used for current login |
| g:UserName | String | Username used for current login |
| g:ProjectName | String | Project of the current login |
| g:DomainName | String | Domain of the current login |

## 3 <br> Getting Started with GES

### 3.1 Querying and Analyzing Graphs

If you have never used GES, you can use the sandbox access function to access a demo graph provided by the system to learn and use the functions of the graph editor. You can learn the functions through Quick Start. The system runs the PageRank algorithm by default.

This section describes how to use GES to query and analyze the sample graph data. The process is as follows:

Step 1: Creating a Graph
Step 2: Accessing the Graph
Step 3: Querying and Analyzing the Graph
Step 4: Viewing the Analysis Result

## Step 1: Creating a Graph

Log in to the GES management console and click Create Graph.
Two creation modes are available: Customize Graph and Use Industry-Specific Graph Template. By default, the system displays the Customize Graph tab page.

Method 1: Customize Graph

Step 1 On the Create Graph page, click the Customize Graph tab and set the following parameters:

1. Select Region.

Region: Area where a graph works. You can select the region from the dropdown list in the upper left corner of the page.
2. On the Configure tab page, set Graph Name and GES Software Version.

- Specify Graph Name, for example, demo, or use the default name in the system.
The graph name must comply with the following rules:
- Contain 4 to 64 characters and start with a letter.
- Letters are case-insensitive.
- Only letters, digits, and underscores (_) are allowed.
- Select the GES Software Version as required.
$\square$ NOTE
Currently, only the default version can be selected.
Figure 3-1 Graph name and software version

```
* Graph Name (?)
ges_1341
* GES Software Version
2.2.4
```

3. Specify network information, including VPC, Subnet, Security Group, and Public Network Access.

Figure 3-2 Network information

a. VPC: A Virtual Private Cloud (VPC) is a secure, isolated, and logical network environment.
Select the VPC for which you want to create the graph and click View VPC to view the name and ID of the VPC.

If your account has a VPC, a VPC will be automatically selected. You can change it as required. If no VPC is available, you need to create a VPC. After the VPC is created, it will be automatically selected.
b. Subnet: A subnet provides dedicated network resources that are logically isolated from other networks, improving network security.
Select the subnet for which you want to create the graph to enter the VPC and view the name and ID of the subnet.
c. Security Group: A security group is a logical group. It provides access control policies for the ECSs that are mutually trusted and have the same security protection requirements in a VPC.

- Click Learn how to configure a security group. to learn how to configure a security group.
- Click View Security Group to learn security group details.
d. Select the Public Network Access mode as required. Possible values are Do not use, Buy now, and Specify.
- Do not use: A graph instance without an elastic IP (EIP) cannot be accessed over the Internet. However, the graph instance can be accessed through ECSs deployed on a private network.
- Buy now: GES automatically allocates an EIP with exclusive bandwidth to the graph instance so that the graph instance can be accessed over the Internet using the EIP. In addition, GES uses the tenant permission to create an agency with the prefix of ges_agency_default automatically in the project to support EIP binding.
- Specify: An EIP allows the graph instance to be accessed over the Internet.
Click Create EIP to access the VPC management console and create an EIP.
e. Enterprise Project: An enterprise project facilitates project-level management and grouping of cloud resources and users.
Click Create Enterprise Project to go to the Enterprise Project Management page.

4. Set graph parameters.

Figure 3-3 Graph parameters

```
* Purpose Enteprise production Developer learning
Supports high reliability and concurrency, suitable for enterpise production and large.scale application.
X86 Kunpeng
CPUArchitecture
X86 Kunpen
* Graph Size (Edges) © 
* Intial Data Required C
*Metadata © schema - C Create Metadata File Download
* Edge Data (%) edge.csv Select Download
\atex Data (0) Select Domen
Vertex Data ©
Log Storage Path (c)
*Edge Processing (2) © Allow repetitive edges (0)
    Ignore subsequent repetitive edges (
    *)
    \square Ignore labels on repetitive edges (%)

*kmS Key (% Autouse_No_Delete - C View kMS Key
* Operation Audit O
*LTS Log Group ges-trace - C View Log Group List
    S.Ingogs to LTS is billed. For details, see the LTS billing standards.
```

a. Purpose: Select Enterprise production or Developer learning.

- Enterprise production: Supports high reliability and concurrency, suitable for enterprise production and large-scale application.
- Developer learning: Offers complete function experience, suitable for developer learning.
b. CPU Architecture: Currently, GES supports X86.
c. Graph Size (Edges): Based on a user's current quota, the system displays the numbers of graphs and edges that can be created. The unit is edge. Enterprise production and Developer learning have different graph specifications.
- Enterprise production: Currently, Million-edge, Ten-million-edge, Hundred-million-edge, Billion-edge, Billion-edge-pro, Ten-billionedge, and One-hundred-billion-edge are supported.
- Developer learning: Currently, only Ten-thousand-edge is supported.
d. Initial Data Required: This option is disabled by default. You can create a graph first and then import data. If you enable this option, you need to set the following parameters:
- Metadata: Indicates the graph metadata information.

If no metadata is available, click Create Metadata File. For details about how to create a metadata file, see Metadata Management. If you already have metadata files, import them to GES.

- Edge Data: Describes edges that form the graph, including information about the edge structures, labels, and properties.
- Vertex Data: Describes vertices that form the graph, including information about all vertex IDs, labels, and properties. If you leave it blank, the vertices in the Edge Data set are used as the source of Vertex Data.
$\square$ NOTE
- The edge and vertex data sets can only be stored in English paths and folders.
- Currently, you can import the edge and vertex data sets only from OBS. Therefore, store data files on OBS in advance..
- The sequence of labels in the selected edge or vertex data set and the sequence of properties in the labels must be the same as those in the selected metadata file. Otherwise, The edge/vertex data file does not match the metadata file is prompted in the upper right corner and the graph fails to be created. For details about the data formats of GES graph data, see Graph Data Formats.
- Import the graph data (including the metadata file, and edge and vertex data sets) in the format specified in the corresponding template. The template contains a copy of movie data. You can click Download to download and import it.
- Log Storage Path: Stores vertex and edge data sets that do not comply with the metadata definition, as well as detailed logs during graph import. Storage on OBS may incur fees, so delete the data in a timely time if you do not need to use it any more.
- Edge Processing: Includes Allow repetitive edges, Ignore subsequent repetitive edges, Overwrite previous repetitive edges, and Ignore labels on repetitive edges.

Repetitive edges have the same source vertex and target vertex. When labels are considered, repetitive edges must have the same source and target vertices and the same labels.
Allow repetitive edges: Multiple edges may exist between a source vertex and a target vertex.
Ignore subsequent repetitive edges: If there are multiple edges between a source vertex and a target vertex, only the first edge read is retained.
Overwrite previous repetitive edges: If there are multiple edges between a source vertex and a target vertex, only the last edge read is retained.
Ignore labels on repetitive edges: If labels are ignored, edges with the source vertex and target vertex are repetitive edges.
5. Advanced Settings: Set this parameter to Default or Custom.

- Default: Use the default values of the system.
- Custom: Include Encrypt Instance and Operation Audit.

Encrypt Instance: Indicate whether to encrypt graph instances. Key Source is default to KMS. KMS Key: Select the corresponding key.
$\square$ NOTE
Disabling or deleting a KMS key affects the instance functions.
Operation Audit: Indicate whether to enable operation audit. LTS Log Group: Select the corresponding log group.
$\square$ NOTE
You will be billed for storing logs to LTS. For details, see the LTS billing standards.
Step 2 Click Next. The Confirm tab page is displayed.
Step 3 Confirm the information and click Submit to create the graph.
Step 4 After the submission is successful, the Finish tab page is displayed. You can click Back to Task Center to view the status and running result of the created graph.
----End

- Method 2: Use Industry-Specific Graph Template

Step 1 On the Create Graph page, click the Use Industry-Specific Graph Template tab and set the following parameters:

1. Select Region.

Region: Area where a graph works. You can select the region from the dropdown list in the upper left corner of the page.
2. On the Configure tab page, set the following parameters:

- Select the target template, for example, Asset Management Graph Template.
- Set network information.

Refer to Method 1: Customize Graph.

Step 2 Click Next. On the Confirm tab page, confirm the specifications and click Submit. The system automatically creates the graph of the selected specifications and inserts the selected template data (schema and sample data).

Step 3 After the submission is successful, the Finish tab page is displayed. You can click Back to Task Center to view the status and running result of the created graph.

NOTE
You do not need to set the name for a graph created using a template. By default, the name of the template is used as the prefix of the created graph, for example, assets_management.
After the graph is created, the name of the created graph is in assets_management_ $X X X X$ format, where $X X X X$ is the unique identifier automatically generated by the system and cannot be modified.
----End

## Step 2: Accessing the Graph

1. On the Graph Management page, locate the row containing the graph to be accessed, for example, demo created in the previous steps, and click Access in the Operation column.
2. Enter the displayed graph editor, and query and analyze the current graph. For details, see Step 3: Querying and Analyzing the Graph.

## Step 3: Querying and Analyzing the Graph

1. You can query and analyze graphs in either of the following ways if a graph is created in Customize Graph mode:

- Queries using Gremlin commands
i. Enter the query command in the Gremlin text box in the lower part of the page, for example, $\mathbf{g} . \mathrm{V}() . \operatorname{limit}(100)$.
[ NOTE
To prevent the system queries from being time-consuming due to a large amount of returned data, you are advised to add the limit parameter and set it to less than 1,000 for a better display effect.

Figure 3-4 Gremlin query

## Gremlin $\quad$ g.V().limit(10)

ii. Press Enter to run the Gremlin command. The query result is displayed in both the drawing area and result area.

Figure 3-5 Gremlin query result

- Analysis by selecting algorithms and configuring parameters
i. The algorithms supported by GES are displayed in the left pane of the graph editor. Select the target analysis algorithm from the list.

Figure 3-6 Algorithm list

| Graph Analytics |  |  |  |
| :---: | :---: | :---: | :---: |
| $\cdots$ | PageRank | (7) | ( |
| $\checkmark 8$ | PersonalRank | (7) | ( |
| $\checkmark$ | K-core | (7) | ( |
|  | K-hop | (7) | ( |
| $\checkmark 4$ | Shortest Path | (7) | ( |
| $\checkmark$ •\# | All Shortest Paths | (2) | ( |
| $\cdots 8$ | n-Paths | (7) | ( |
| \% | Closeness Central... | (3) | ( |
| $\checkmark$ | Label Propagation | (3) | ( |
| $\checkmark 9$ | Louvain | (7) | ( |
| $\cdots$ | Link Prediction | (7) | ( |
| $\checkmark i$ | Node2vec | (7) | ( |
| $\cdots$ | Real-time Recom... | (?) | ( |
| $\checkmark 12$ | Common Neighb... | (7) | ( |
| \% | SSSP | (2) | ( |

ii. Select the algorithm to be used, expand its parameter configuration
by clicking , and input corresponding values based on the required range. Take PageRank as an example. alpha indicates the weight coefficient, and its value is 0.85 . convergence is the convergence coefficient, and its value is $\mathbf{0 . 0 0 0 0 1}$. max_iterations
indicates the maximum iterations and its value is $\mathbf{1 , 0 0 0}$. directed indicates whether to consider the edge direction and the default value is true.

Figure 3-7 Setting PageRank algorithm parameters

iii. Execute the algorithm by clicking ${ }^{(1)}$. The analysis result is displayed in both the drawing area and result area.

Figure 3-8 Analysis result

2. For a graph created using an industry-specific template, in addition to using the Gremlin commands and selecting algorithms and configuring parameters, four public operation scenarios of the industry-specific graph template are added.

- Scenario 1: List administrators and their applications.
- Command: g.V().hasLabel('admin').outE().otherV().hasLabel('application').p ath()
- Procedure: Click Run. The graph is displayed on the canvas.
- Scenario 2: Find all paths from administrator $x$ to equipment room $x$.
- Implementation principle: get\$\{Administrator $x\}$ is the source vertex and $\$\{$ Equipment room $x\}$ is the target vertex. Find out all paths using the n -Paths algorithm, where source is Administrator $x$, target is Equipment room $x$, direct is false, $\mathbf{n}$ is 10 , and $\mathbf{k}$ is 10 .
- Procedure: Click Run. In the dialog box that is displayed, select administrator $x$ and equipment room $x$ from the drop-down list box. After the operation is complete, the graph is displayed on the canvas.
- Scenario 3: Find all VMs and physical machines on which application $x$ depends.
- Implementation principle: get\$\{Application $x\}$ is the input to find all points at layer 2 . Use the K-Hop algorithm, where $\mathbf{k}$ is 2 , source is $x$, and mode is in.
- Procedure: Click Run. In the dialog box that is displayed, set the application $x$ (select the application from the drop-down list box and drag the vertex of the application entity to the drop-down list box). After the operation is complete, the graph is displayed on the canvas.
- Scenario 4: Find all vertices with a specified label, for example, all administrators, equipment rooms, and physical machines in the graph.
- Implementation principle: Filter vertices by label.
- Procedure: Click Run. In the dialog box that is displayed, select the label from the drop-down list box. After the operation is complete, the graph is displayed on the canvas.

## Step 4: Viewing the Analysis Result

You can view the running record and query result in the result area or click the Export button on the right to download the analysis result.

## 4 <br> Introduction to GES Management Console

### 4.1 Graph Data Formats

Before importing graph data, familiarize yourself with the graph data formats supported by GES.

- GES supports the loading of raw graph data in the standard CSV format. If your raw data is not in the specified format, convert it to the format supported by GES.
- GES graph data consists of the vertex, edge, and metadata files.
- Vertex files store vertex data.
- Edge files store edge data.
- Metadata is used to describe the formats of data in vertex and edge files.

## Concept Description

Graph data is imported based on the property graph model in GES, so you must learn the concept of the property graph.

A property graph is a directed graph consisting of vertices, edges, labels, and properties.

- A vertex is also called a node, and an edge is also called a relationship. Nodes and relationships are the most important entities.
- The metadata is used to describe vertex and edge properties. The metadata consists of multiple labels and each label consists of one or more properties.
- Vertices with the same label belong to a group or a set.
- Each vertex or edge can have only one label.

In the following example, the graph data consists of three vertices and three edges. Vivian, Eric, and Lethal Weapon indicate vertices. (Vivian, Eric), (Vivian, Lethal Weapon), and (Eric, Lethal Weapon) indicate edges. user and movie indicate the vertex types (labels), and rate and friends indicate the relationship types (labels).

Figure 4-1 Graph data format example

## Metadata

The GES metadata is a file in XML format and is used to define vertex and edge properties.

It contains labels and properties.

- Label

A label is a collection of properties. It describes all property data formats contained within a vertex or an edge.
$\square]$ NOTE
If the same Property Name is defined in different labels, the Cardinality and Data Type in different labels must be the same.

- Property

A property refers to the data format of a single property and contains three fields.

- Property Name: Indicates the name of a property. It contains 1 to 256 characters and cannot contain special characters such as angle brackets (<>) and ampersands (\&).
[] NOTE
A label cannot contain two properties with the same name.
- cardinality: Indicates the composite type of data. Possible values are single, list, and set.
- single indicates that the data of this property has a single value, such as a digit or a character string.

## $\square$ NOTE

If the value of a single property in a data file is value1;value2, value1;value 2 is regarded as a single value.

- list and set indicate that data of this property consists of multiple values separated by semicolons (;).
- list: The values are placed in sequence and can be repeated. For example, 1;1;1 contains three values.
- set: The values are in random sequence and must be unique. Duplicate values will be overwritten. For example, 1;1;1 contains only one value (1).

## [] NOTE

list and set do not support the char array data type.

- Data Type: Indicates the data type. The following table lists the data types supported by GES.

Table 4-1 Supported data types

| Type | Description |
| :--- | :--- |
| char | Character |
| char array | Fixed-length character string (The maximum length <br> must be specified.) <br> NOTE <br> - Only single supports the data type. <br> - If the data is a character string, you are advised to set <br> this parameter to char array. If it is set to string, the <br> import is slower. |
| float | Float type (32-bit float) |
| double | Double float type (64-bit float) |
| bool | bool type. Possible values are (0/1) and (true/ <br> false). |
| long | Long integer (value range: -2^63 to 2^63-1) |
| int | Integer (value range: -2^31 to 2^31-1) |
| date | Date. Currently, the following formats are <br> supported: <br> - YYYY-MM-DD HH:MM:SS <br> - YYYY-MM-DD |
| NOTE <br> The value of MM or DD must consist of two digits. If the <br> day or month number contains only one digit, add 0 <br> before it, for example, 05/01. |  |

| Type | Description |
| :--- | :--- |
| enum | Enumeration (you need to specify the number of <br> enumeration types and each enumeration value). <br> For details, see Figure 4-2. |
| string | Variable character string <br> NOTE <br> The string length is not fixed, which affects data import <br> efficiency. You are advised to use char array instead. <br> You can define the length of char array based on service <br> requirements. It is recommended that the length be less <br> than or equal to 32 characters. |

The following figure shows the metadata example:
Figure 4-2 Metadata example

## Vertex Files

A vertex file contains the data of each vertex. A vertex of data is generated for each behavior. The following shows the format. id is the unique identifier of a set of vertex data.
id, label, property 1 , property 2 , property $3, \ldots$

## $\square$ NOTE

- The vertex ID cannot contain hyphens (-).
- You do not need to set the vertex ID type. Its default value is string.

## Example:

Lethal Weapon, movie, Lethal Weapon, 1987, Action; Comedy; Crime; Drama
Vivian, user, Vivian, F, 25-34, artist, 98133
Eric, user, Eric, M, 18-24, college/grad student, 40205

## Edge Files

An edge file contains the data of each edge. An edge of data is generated for each behavior. Graph specifications in GES are defined based on the edge quantity, for example, one million edges. The following shows the format. id $\mathbf{1}$ and id $\mathbf{2}$ are the IDs of the two endpoints of an edge.
id 1 , id 2 , label, property 1 , property $2, \ldots$
Example:
Vivian,Lethal Weapon,rate,5,2000-12-27 23:44:41
Eric,Lethal Weapon,rate,4,2000-11-21 15:33:18
Vivian,Eric,friends

### 4.2 Overview

The Overview page displays the My Resource information, including Graph Status, Graph Size, Prepayment Details, and Graph Backup, enabling you to quickly learn the information about existing graphs and charging details.

Figure 4-3 Overview

## Graph Status

Graph Status displays the number of graphs in different statuses. Currently, the system supports the following statuses.

Table 4-2 Status description

| Status | Description |
| :--- | :--- |
| Running | Indicates running graphs. Graphs in this status can be <br> accessed. |
| Preparing | Indicates graphs whose ECSs are being created or started. |
| Starting | Indicates graphs being started. |
| Stopping | Indicates graphs being stopped. |
| Upgrading | Indicates graphs being upgraded. |
| Importing | Indicates graphs being imported. |
| Exporting | Indicates graphs being exported. |
| Rolling back | Indicates graphs being rolled back. |
| Clearing | Indicates graphs being cleared. |
| Stopped | Indicates stopped graphs. Graphs in this status cannot be <br> accessed, but can be restarted. |
| Frozen | Indicates that the user's account and resources are frozen. <br> NOTE <br> After a user account is frozen, only deletion operations are allowed. |
| Abnormal | Indicates abnormal graphs. Graphs in this status cannot be <br> accessed. |
| Failed | Indicates graphs failed to be created. |

## Graph Size

Graph Size displays the number of graphs in different sizes. Currently, the system supports seven sizes.

Table 4-3 Specifications

| Specifications | Description |
| :--- | :--- |
| 10 thousand | Indicates that the number of edges of a graph cannot exceed <br> 10 thousand. |
| 1 million | Indicates that the number of edges of a graph cannot exceed <br> one million. |

| Specifications | Description |
| :--- | :--- |
| 10 million | Indicates that the number of edges of a graph cannot exceed <br> 10 million. |
| 100 million | Indicates that the number of edges of a graph cannot exceed <br> 100 million. |
| 1 billion | Indicates that the number of edges of a graph cannot exceed <br> one billion. |
| 10 billion | Indicates that the number of edges of a graph cannot exceed <br> 10 billion. |
| 100 billion | Indicates that the number of edges of a graph cannot exceed <br> 100 billion. |

## Graph Backup

The graph data can be backed up to prevent data loss. Graph Backup displays the numbers of graphs that are backed up and are not backed up.

Table 4-4 Backup statuses

| Backup Status | Description |
| :--- | :--- |
| Backed up | Indicates the number of graphs that are backed up. |
| Non-backed up | Indicates the number of graphs that are not backed up. |

## Industry-Specific Graph Templates

The industry-specific graph templates are product packages provided for common scenarios of governments and enterprises. Each product package has built-in graph models and sample data, which can be used out of the box. Only two steps are required from order placement to graph visualization. Those templates enable you to quickly experience the powerful analysis and scenario response capabilities of graphs.

## Payment Details.

This part displays the purchase methods, number of instances, and expiration time of different graph sizes.

### 4.3 Graph Management

### 4.3.1 Graph Management Overview

On the Graph Management page, you can view the running status, internal access address, external access address, and creation time of a graph, and perform the following operations:

- Creating and Accessing a Graph
- Backing Up a Graph on Graph Management
- Importing Data
- Starting a Graph
- Stopping a Graph
- Deleting a Graph
- Upgrading a Graph
- Exporting a Graph
- Binding an EIP
- Unbinding an EIP
- Clearing Data
- Viewing Monitoring Metrics
- Querying Schema

Click next to a graph name, you can view details about the graph, including the graph ID, VPC, subnet, security group, graph size (edges), vertex data set, edge data set, metadata, graph version, cross-AZ HA status, creator, enterprise project, encryption status, and CPU architecture.

### 4.3.2 Creating and Accessing a Graph

## Scenario

On the Graph Management page, you can click Access to query and analyze a created graph.

## Procedure

For details about how to create and access a graph, see Querying and Analyzing Graphs.

### 4.3.3 Backing Up a Graph on Graph Management

## Scenario

To ensure data security, back up the graph data so that you can restore it when faults occur.

## Procedure

You can perform the backup operation on the Graph Management page or the Backup Management page.

- For details about operations on the Backup Management page, see Backing Up a Graph.
- Operations on the Graph Management are as follows:
a. Log in to the GES management console.
b. In the navigation tree on the left, select Graph Management.
c. Locate the target graph in the graph list and select Back Up in the Operation column.
d. In the displayed dialog box, click Yes.

Figure 4-4 Backup on the Graph Management page

> Back Up Graph

* Associated Graph:
demo
demo *

## Yes

```
                                    No
```

## [] NOTE

On the Graph Management page, the backup operation can be performed only on the selected graph. The associated graph cannot be changed.
e. In the navigation tree on the left, select Backup Management. You can view the data being backed up and already backed up in the backup list. If Status changes from Backing up to Succeeded, the backup is successful.

Figure 4-5 Backup management list

### 4.3.4 Importing Data

## Scenario

GES allows you to select initial data during graph creation or incrementally import data after the graph is created.

- Select initial data during cluster creation.

If you select the initial data when creating a graph, the data is imported to the graph by default. You do not need to import it again.

- Incrementally import data after the graph is created.

If you need to add data after a graph is created, click Import in the graph list to import the data incrementally.

## $\square$ NOTE

- Currently, only graphs of version 1.1.8 and later support this function.
- To prevent failures in restoring the imported graph data during system restart, do not delete the data stored on OBS when the graph is in use.
- The default separator of data columns is comma (,). You cannot define a separator.

The following provides the procedure for incrementally importing data:

## Procedure

Step 1 Log in to the GES management console.
Step 2 In the navigation tree on the left, select Graph Management.
Step 3 Locate the target graph in the graph list and select Import in the Operation column.
Step 4 In the Import dialog box that is displayed, set the following parameters:

- Metadata: Select an existing metadata file or create one. For details, see Metadata Management.
- Edge Data: Select the corresponding edge data set.
- Vertex Data: Select the corresponding vertex data set. If you leave it blank, the vertices in the Edge Data set are used as the source of Vertex Data.
- Log Storage Path: Stores vertex and edge data sets that do not comply with the metadata definition, as well as detailed logs generated during graph import. Storage on OBS may incur fees, so delete the data in time.
- Edge Processing: Includes Allow repetitive edges, Ignore subsequent repetitive edges, Overwrite previous repetitive edges, and Ignore labels on repetitive edges. For details, see Edge Processing.
- Import Type: The value can be Online import or Offline import.

Figure 4-6 Importing data

## Step 5 Click OK.

----End

### 4.3.5 Starting a Graph

## Scenario

You can start graphs in Stopped status in the graph list so that they can be accessed and analyzed again.
Graphs in Running status cannot be started.

## Procedure

Step 1 Log in to the GES management console.
Step 2 In the navigation tree on the left, select Graph Management.
Step 3 Locate the target graph in the graph list and choose More > Start in the Operation column.

- If the graph to be started has backups, a dialog box is displayed indicating that you can select either of the following methods to start the graph:
- Restore Last Graph: Restart the graph that stopped running.
- Start Backup: Start the graph using the backup data.

After selecting a startup method, click Yes. The graph status becomes Preparing and the progress is displayed.

- If the graph to be started does not have backups, the graph status changes to Preparing and the progress is displayed after you click Start.

Step 4 After the graph is started, the status changes from Preparing to Starting. Wait several minutes. When the startup is successful, the graph status is switched to Running.NOTE
If the startup fails, try again later. If the failure persists, fill in and submit a service ticket to contact the technical support.
----End

### 4.3.6 Stopping a Graph

## Scenario

If you do not need to use a graph, you can stop it. After the graph is stopped, you cannot access it.NOTE
Resources are not released after you stop the graph.

## Procedure

Step 1 Log in to the GES management console.
Step 2 In the navigation tree on the left, select Graph Management.
Step 3 Locate the target graph in the graph list and choose More > Stop in the Operation column.

Step 4 The graph status changes to Stopping. Wait several minutes. When the graph is successfully stopped, the graph status is switched to Stopped.
----End

### 4.3.7 Deleting a Graph

## Scenario

If you have analyzed the graph data, you can delete the graph to release resources.

Backups of a graph will be also deleted after the graph is deleted, and data cannot be recovered. Therefore, exercise caution when performing this operation.

## Procedure

Step 1 Log in to the GES management console.
Step 2 In the navigation tree on the left, select Graph Management.
Step 3 Locate the target graph in the graph list and choose More > Delete in the Operation column.

Step 4 In the dialog box that is displayed, select or deselect Release the EIP bound with the graph instance. If you do not select this option, the EIP will continue to be charged.

Step 5 Click Yes to complete the deletion.

### 4.3.8 Upgrading a Graph

## Scenario

Because the GES software is upgraded continuously, graphs of earlier versions can also be upgraded to the new version.NOTE
Currently, only graphs of version 1.0.3 and later can be upgraded.

## Procedure

Step 1 Log in to the GES management console.
Step 2 In the navigation tree on the left, select Graph Management.
Step 3 Locate the target graph in the graph list and choose More > Upgrade in the Operation column.

Step 4 In the displayed dialog box, select a version from the Version List and determine whether to select Forcible Upgrade.NOTE
If Forcible Upgrade is selected, all in-progress tasks will be interrupted. Exercise caution when performing this operation.

Step 5 Click OK. The graph status changes to Upgrading. Wait several minutes, the status will become Running after the upgrade is successful.NOTE
If the upgrade fails, the graph automatically rolls back to the source version.
----End

### 4.3.9 Exporting a Graph

## Scenario

This topic describes how to export the graph data to a user-defined OBS directory.

## NOTE

Currently, only graphs of version 1.0.3 and later support this function.

## Procedure

Step 1 Log in to the GES management console.
Step 2 In the navigation tree on the left, select Graph Management.
Step 3 Locate the target graph in the graph list and choose More > Export in the Operation column.

Figure 4-7 Exporting a graph
Export

* Export Path:

| Name | Last-Modified | Type | Size |
| :--- | :--- | :--- | :--- |
| eywa | - | BUCKET | - |
| ges-cts | - | BUCKET | - |
| ges-graphs | - | BUCKET | - |
| ges-training-data | - | BUCKET | BUCKET |

Step 4 In the lower part of the displayed page, select a storage path.
Step 5 Click OK. The graph status changes to Exporting. Wait several minutes, the status will become Running after the export is successful.

You can check whether the data is exported successfully in the selected OBS path. ----End

### 4.3.10 Binding an EIP

## Scenario

To access GES over the public network, you can bind an Elastic IP Address (EIP).

## Procedure

Step 1 Log in to the GES management console.

Step 2 In the navigation tree on the left, select Graph Management.
Step 3 Locate the target graph in the graph list and choose More > Bind EIP in the Operation column.

Step 4 On the displayed Bind EIP page, select an available EIP.
If no EIP is available, click Create EIP to create one. Then, click ${ }^{C}$ to refresh the list and select the created EIP.

Figure 4-8 Binding an EIP

## Bind EIP

* EIP No EIP available. $\quad$ Create EIP OK Cancel

Step 5 Click OK.
----End

### 4.3.11 Unbinding an EIP

## Scenario

If you do not need to use the EIP, unbind it to release the network resources.

## Procedure

Step 1 Log in to the GES management console.
Step 2 In the navigation tree on the left, select Graph Management.
Step 3 Locate the target graph in the graph list and choose More > Unbind EIP in the Operation column.

Step 4 In the displayed dialog box, click Yes.
----End

### 4.3.12 Clearing Data

## Scenario

If unnecessary data is imported or the imported data volume exceeds the graph size, you can clear the data.

In addition, if you delete data by mistake using the Gremlin commands, you can clear the broken data and import the correct data again.

## NOTE

This operation will clear all vertex and edge data of the graph. Exercise caution when performing this operation.

## Procedure

Step 1 Log in to the GES management console.
Step 2 In the navigation tree on the left, select Graph Management.
Step 3 Locate the target graph in the graph list and choose More > Clear Data in the Operation column.

Step 4 In the dialog box that is displayed, select or deselect Clear the metadata in the graph.
$\square$ NOTE
Deleted metadata cannot be recovered. Exercise caution when performing this operation.

## Step 5 Click Yes.

### 4.3.13 Viewing Monitoring Metrics

## Scenario

Cloud Eye monitors the running status of GES. You can view the monitoring metrics of GES on the Cloud Eye management console.

Monitored data takes a period of time for transmission and display. The GES status displayed in the Cloud Eye monitoring data is the status obtained 5 to 10 minutes before. You can view the monitored data of a newly created graph 5 to 10 minutes later.

## Prerequisites

- The created graph is running properly.
- The graph has been properly running for at least 10 minutes. For a newly created graph, you need to wait for a while before viewing its monitoring metrics.
- Cloud Eye does not display the metrics of a faulty or stopped graph. You can view the monitoring metrics after the graph starts or recovers.

## Procedure

1. Log in to the management console.
2. In the navigation pane, choose Graph Management. In the Operation column, choose More > View Metric. The Cloud Eye management console is displayed.
3. On the monitoring page for GES, you can view the figures of all monitoring metrics.

Figure 4-9 Viewing GES monitoring metrics

4. To view the monitoring curve in a longer time range, click ${ }^{\kappa}{ }^{\star}$ to enlarge each figure.

Figure 4-10 Zoomed in monitoring graph

${ }^{0.1}$
$\infty$
ar

5. The system allows you to select a fixed time range or use automatic refresh.
a. Fixed time ranges include $\mathbf{1 h}, \mathbf{3 h}$, and $\mathbf{1 2 h}$.
b. The automatic refresh interval is 60 s, which is used as the user monitoring period.

### 4.3.14 Querying Schema

## Scenario

Query the metadata of a graph. The metadata contains labels and properties.

## Procedure

1. Log in to the management console.
2. In the navigation pane, choose Graph Management. In the Operation column, choose More > Query Schema. A window is displayed, showing the labels contained in the metadata of the current graph.

Figure 4-11 Querying schema

## Query Schema

$5 \rightarrow$ Total Records: $5<1$
3. To view the properties contained in labels, click ${ }^{\vee}$ of each label.

Figure 4-12 Viewing properties in labels

## Query Schema

| Label Name | rate |  |
| :--- | :--- | :--- |
| Property Name | Cardinality | Data Type |
| Rating | Single value | int |
| Datetime | Single value | string |

### 4.4 Backup Management

### 4.4.1 Overview of Backup Management

On the Backup Management page, you can view the associated graph name, status, and creation time of a graph backup, and perform the following operations:

- Backing Up a Graph
- Loading a Graph
- Deleting a Backup

### 4.4.2 Backing Up a Graph

## Scenario

To ensure data security, back up the graph data so that you can restore it when faults occur.

## Procedure

You can perform the backup operation on the Graph Management page or the Backup Management page.

- For details about operations on the Graph Management page, see Backing Up a Graph on Graph Management.
- Operations on the Backup Management are as follows:
a. Log in to the GES management console.
b. In the navigation tree on the left, select Backup Management.
c. In the upper right corner of the Backup Management page, click Back Up Graph.
d. On the Back Up Graph page, select an Associated Graph (graph created by the current user) and click OK to start backup.

Figure 4-13 Backup on the Backup Management page

## Back Up Graph

```
* Associated Graph:
```

```
ges_VRP *
```

## OK Cancel

You can select an Associated Graph if you perform the backup operation on the Backup Management page. However, if the system has only one graph, you cannot change the value of Associated Graph.
e. In the backup list, you can view the data being backup up or newly backed up.
If Status is Backing up, wait several minutes. When Status is switched to Succeeded, the backup is successful.

Figure 4-14 Backup management

### 4.4.3 Loading a Graph

## Scenario

If the graph data being edited is incorrect, you can load the backup data to restore the graph data for analysis.

## Procedure

Step 1 Log in to the GES management console.
Step 2 In the navigation tree on the left, select Backup Management.
Step 3 On the Backup Management page, locate the backup data and click Load in the Operation column.

Step 4 On the Load dialog box, confirm the backup data, select The loading operation will overwrite associated graphs. After loading starts, associated graphs will be restarted from backups, and click Yes. After loading starts, the associated graph will be restarted from its backup. Click Yes.

Figure 4-15 Data loading
Load

| Backup Name | Associated Graph ... | Status |
| :--- | :--- | :--- |
| sanguo-20180705231442 | sanguo | Stopped | | The loading operation will overwrite associated graphs. After loading |
| :--- |
| starts, associated graphs will be restarted from backups. |

Step 5 After a message is prompted indicating that the loading is successful, you can access the associated graph and obtain the loaded data on the Graph Management page.

### 4.4.4 Deleting a Backup

## Scenario

If the backup data will not be used any more, you can delete it based on site requirements.

## Procedure

Step 1 Log in to the GES management console.
Step 2 In the navigation tree on the left, select Backup Management.
Step 3 In the backup list, select the backup data to be deleted and click Delete in the Operation column.

Step 4 In the displayed dialog box, click Yes to delete the data.
DOTE
The deleted data cannot be recovered. Exercise caution when performing this operation.
----End

### 4.5 Metadata Management

Metadata refers to the metadata in the graph data, specifying the graph data type.

On the Metadata Management page, you can view the storage path, status, encryption status, and creation time of a metadata file, and perform the following operations:

- Importing a Metadata File
- Creating a Metadata File
- Searching for a Metadata File
- Editing a Metadata File
- Copying a Metadata File
- Deleting a Metadata FileNOTE
The maximum number of metadata files that can be imported or created is 50 .

## Importing a Metadata File

If you already have metadata files, import them to GES for subsequent graph creation.

The procedure is as follows:

1. On the GES management console, click Metadata Management in the navigation tree on the left.
2. On the Metadata Management page, click Import in the upper left corner.
3. On the Import page, select Local or OBS in Type to import a metadata file form a local path or OBS.

- Importing a metadata file from a local path

Select Local File: Click Upload to select a local file.
[ NOTE
The file must be in the XML format.
Name: Enter the metadata file name.
Storage Path: Select an OBS path for storing the metadata file.
Figure 4-16 Importing metadata from a local path
Import

* Type
* Select Local File
* Name
* Storage Path
* Encrypt Metadata

```
schema.xml
schema01
gestest/movie/schema01.xml
- Importing a metadata file from OBS

Select File Path: Select a metadata file from OBS by clicking

\(\square\) NOTE
- The file must be in the XML format.
- You need to upload the metadata file to your OBS bucket in advance.

Name: Enter the metadata file name.

Figure 4-17 Importing data from OBS

```

OK
Cancel

```
4. Click OK to import the metadata.

After the import is complete, the metadata file is displayed on the Metadata Management page.

\section*{Creating a Metadata File}

If no metadata file is available in the local path or on OBS, you can manually create metadata files.

The procedure is as follows:
1. On the Metadata Management page, click Create Metadata File in the upper right corner.
2. Configure the following parameters on the displayed page:

Name: Enter the metadata file name. The default file format is XML.
Storage Path: Select an OBS path for storing the metadata file. If you create metadata for the first time, you need to enable OBS. You are advised to obtain user authorization to automatically create OBS buckets for storing the metadata.
Encrypt Metadata: This parameter determines whether to encrypt the metadata. It is disabled by default. Key Source is default to KMS. KMS Key: Select the corresponding key.
[1] NOTE
Disabling or deleting a KMS key affects the instance functions.
Definition: Detailed label definitions in the metadata file. Multiple labels can be defined in a metadata file. Click Add label to add labels as required.
In Definition, specify the Label Name and add properties under a label. You can click Add to add properties and click Up and Down to sort the properties. Table 4-5 lists the property parameters. For details about other metadata information, see section Graph Data Formats.

Figure 4-18 Creating a metadata file

Table 4-5 Property parameters
\begin{tabular}{|l|l|}
\hline Name & Description \\
\hline \begin{tabular}{l} 
Proper \\
ty \\
Name
\end{tabular} & \begin{tabular}{l} 
Indicates the name of a property. It contains 1 to 256 characters \\
and cannot contain special characters such as angle brackets (<>) \\
and ampersands (\&).
\end{tabular} \\
\hline \begin{tabular}{l} 
Cardin \\
ality
\end{tabular} & \begin{tabular}{l} 
Indicates the composite type of data. \\
- Single value: indicates that the data of this property has a \\
single value, such as a digit or a character string. \\
- Multiple values: indicates that data of this property consists of \\
multiple values separated by semicolons (;). You can determine \\
whether to allow repetitive values.
\end{tabular} \\
\hline \begin{tabular}{l} 
Data \\
Type
\end{tabular} & \begin{tabular}{l} 
Indicates the data type of a property. Possible values are char, \\
float, double, bool, long, int, date, enum, string, and char array. \\
For details, see Table 4-1. \\
NOTE \\
Only the single-value type supports the char array data type.
\end{tabular} \\
\hline \begin{tabular}{l} 
Operat \\
ion
\end{tabular} & \begin{tabular}{l} 
Click Remove to delete unnecessary properties. \\
\hline
\end{tabular} \\
\hline
\end{tabular}
3. Click OK. After the metadata file is created, it will be displayed on the Metadata Management page.

\section*{Searching for a Metadata File}

On the Metadata Management page, enter the name of a metadata file in the search box to search for it.

\section*{Editing a Metadata File}

If the metadata file you imported or created does not meet service requirements and needs to be modified, you can modify its labels and properties online.
\(\square\)
NOTE
After the metadata file is edited, the original metadata file will be overwritten. To avoid data loss, you are advised to copy the metadata file before editing it.

The procedure is as follows:
1. GES provides two methods for you to edit a metadata file on the Data Management page.
- Click the metadata file name. On the metadata details page, click Edit at the bottom of the page.
- Click Edit in the Operation column of the target metadata file.
2. On the Edit page, you can add labels or properties, change the label names, and sort properties by clicking Up and Down.
3. After the modification is complete, click OK.

\section*{Copying a Metadata File}

If you edit a metadata file, the original metadata file will be overwritten. To avoid loss of the original metadata file, you are advised to copy the file before editing it.

The procedure is as follows:
1. GES provides two methods for you to copy a metadata file on the Data Management page.
- Click the metadata file name. On the metadata details page, click Copy at the bottom of the page.
- Click Copy in the Operation column of the target metadata file.
2. Define the metadata file name and storage path.

Name: Enter the name of the copied metadata file. The default file format is XML.
Storage Path: Enter the OBS path for storing the metadata file.
Encrypt Metadata: This parameter determines whether to encrypt the copied metadata. It is disabled by default. Key Source is default to KMS. KMS Key: Select the corresponding key.

Figure 4-19 Copying a metadata file

3. Click OK.

After the file is copied, the new metadata file will be displayed on the Metadata Management page.

\section*{Deleting a Metadata File}

If a metadata file becomes invalid, locate it in the metadata file list and click Delete in the corresponding Operation column to delete it on the Metadata Management page.NOTE
The deleted data cannot be recovered. Exercise caution when performing this operation.

\subsection*{4.6 Task Center}

The task center displays details about asynchronous tasks, such as creating, backing up, starting, and deleting graphs.

You can view the information about a graph's tasks, including the task types, names, associated graphs, start time, end time, task statuses, and running results.

Figure 4-20 Task center

- You can click View Details, Cause of Failure, and Job ID in the Running Result column to view corresponding information.

Figure 4-21 Viewing details
View Details
\begin{tabular}{|l|l|l|l|l|l|l|l|}
\hline Type \(\hat{\star}\) & File Path & Stat... & Failure Cause & Log & Total Import... & Row Import... & Successfull... \\
\hline Edge Da... & ges-graphs/money_1... & Compl... & - & - & 2498 & 0 & 2498 \\
\hline
\end{tabular}

If the task status is Partially successful when you import a graph, you can click View Details to view information such as the type of data that fails to be imported and the number of rows that fail to be imported. To view the cause of failure, check the log path (optional) specified when you import the graph because failure logs are uploaded to the path.

Figure 4-22 Partially successful

\section*{View Details}
\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline JミType & File Path & \(\checkmark\) S \({ }^{\text {t }}\) & Cause of Failure & Log & Total Importe... & Row Import F... & Successfully I... \\
\hline Vertex Da & obs-gesdata/auDatas/a.. & Succeed.. & - & - & 155 & 0 & 155 \\
\hline Edge Data... & obs-gesdata/auDatas/a... & Partially .- & - & - & 107 & 1 & 106 \\
\hline Metadata & obs-gesdata/auDatas/a... & Succeed... & - & - & 2 & 0 & 2 \\
\hline
\end{tabular}
- Use any of the following methods to search tasks:
- \(\quad\) Setting the time
- Selecting the task type
- Selecting the task status
- Entering an associated graph
- Filtering the task name in the task list

\subsection*{4.7 Sandbox Access}

You can use the sandbox access function to access a demo graph provided by the system to learn and use the functions of the graph editor.
In the navigation pane of the GES management console, click Access Sandbox. You can learn the page functions through Quick Start. The system runs the PageRank algorithm by default.

Figure 4-23 Sandbox access

\section*{Algorithm Library}

The algorithm library lists all algorithms supported by GES. You can set the properties of each algorithm in this area. Table 5-2 describes the functions of the algorithm area.

Figure 4-24 Algorithm library

\section*{Gremlin Query}

Gremlin is a graph traversal language in the open source graph calculation framework of Apache TinkerPop. You can use Gremlin to query, modify, and traverse graph data as well as filter properties. For details, see Gremlin Query.

Figure 4-25 Gremlin query

> \begin{tabular}{l|l}  Gremlin & Input a Gremlin command and press Enter to execute it. \end{tabular}

\section*{\(\square\) \\ NOTE}

Gremlin in the sandbox experience environment does not support write and cyclic operations, such as repeat(), times(), until(), emit(), and loops().

\section*{Viewing Vertex Properties}

On the canvas, select a vertex or an edge, right-click, and select View Property to view the property information about the selected vertex or edge on the Property tab page.

Figure 4-26 Viewing vertex properties

\section*{Search by Association}

On the canvas, select a vertex, right-click, and select Search by Association to find vertices associated with the selected vertex. You can select OUT, IN, and ALL.

Figure 4-27 Search by Association

\section*{Filtering Labels and Properties}

You can select a label and its properties to filter and display the required graph information.

Figure 4-28 Filtering labels and properties

\section*{5 Introduction to the Graph Editor}

\subsection*{5.1 Accessing the GES Graph Editor}

\section*{Scenario}

You can use the graph editor to query and analyze graphs. It has extensive built-in algorithms for customers to use in different scenarios of different fields. In addition, it is compatible with the Gremlin query language and supports open APIs. GES is easy to use even for zero-based users.

\section*{Procedure}

Step 1 Log in to the GES management console and select Graph Management.
Step 2 On the Graph Management page, select the graph to be accessed and click Access in the Operation column.
\#ges_01_0022/fig1567410497529 shows the graph editor page. You can analyze the graph data on the graph editor. For details, see Querying and Analyzing Graphs.

Figure 5-1 Graph editor

\subsection*{5.2 Graph Editor Overview}

The graph editor consists of the algorithm library, Gremlin, canvas, result display, and filtering and property areas.

Table 5-1 Area description
\begin{tabular}{|l|l|}
\hline Area & Description \\
\hline \begin{tabular}{l} 
Algorithm \\
Library
\end{tabular} & \begin{tabular}{l} 
Lists all algorithms supported by GES. You can set the properties of \\
each algorithm in this area. Table 5-2 describes the functions of \\
the algorithm library. \\
NOTE \\
After you select an algorithm in the algorithm library and execute it, the \\
canvas displays the sampling sub-graph that contains the key result. The \\
execution result is incomplete. To obtain the complete returned result, call \\
the corresponding API.
\end{tabular} \\
\hline Gremlin & Allows you to enter Gremlin query statements to query a graph. \\
\hline Canvas & \begin{tabular}{l} 
Displays the graph data in a visualized manner. Shortcut operations \\
are preset in the drawing area for you to easily analyze the graph \\
data. \\
Table 5-3 describes the functions of the drawing area.
\end{tabular} \\

\subsection*{5.3 Gremlin Query}

\section*{Scenario}

Gremlin is a graph traversal language in the open source graph calculation framework of Apache TinkerPop. You can use Gremlin to query, modify, and traverse graph data as well as filter properties.

\section*{Procedure}

Step 1 Log in to the GES graph editor. For details, see Accessing the GES Graph Editor.
Step 2 In the Gremlin text box, enter the query commands and press Enter to run the commands.

Common query commands are as follows:
- Vertex query
g.V().limit(100): This command is used to query all vertices but the returned vertices are restricted to 100 . You can also use the range ( \(\mathbf{x}, \mathbf{y}\) ) operator to obtain vertices within the specified quantity range.
g.V().hasLabel('movie'): This command is used to query vertices whose label value is movie.
g.V('11'): This command is used to query the vertex whose ID is \(\mathbf{1 1}\).

The g.V () syntax is not recommended because it affects the display effect if the vertex scale is large.
- Edge query
\(\mathbf{g . E ( ) : ~ T h i s ~ c o m m a n d ~ i s ~ u s e d ~ t o ~ q u e r y ~ a l l ~ e d g e s . ~ Y o u ~ a r e ~ n o t ~ a d v i s e d ~ t o ~ u s e ~}\) this command because you need to add filter criteria or limit the returned results when the edge volume is too large.
g.E('55-81-5'): This command is used to query the edge whose ID is 55-81-5.
g.E().hasLabel('rate'): This command is used to query edges whose label value is rate.
g.V('46').outE('rate'): This command is used to query the edge whose ID is 48 and all labels are rate.
- Property query
g.V().limit(3).valueMap(): This command is used to query all properties of a vertex. (This is an optional parameter and only one vertex is queried. All properties of the vertex are displayed in one row.)
g.V().limit(1).label(): This command is used to query the label of a vertex.
g.V().limit(10).values('userid'): This command is used to query the name property of a vertex. (This parameter can be left blank and all properties are queried. Each property is displayed in one row, containing only the value).
- Adding a vertex
- Method 1:
a = graph.addVertex(label,'user',id,'500','age','18-24'): This command is used to add a vertex whose label is user, ID is 500, and age is 18 to 24.
- Method 2:
g.addV('user').property(id,'600').property('age','18-24'): This command is used to add a vertex whose label is user, ID is 500, and age is 18 to 24.
- Deleting a vertex
g.V('600').drop(): This command is used to delete the vertex whose ID is \(\mathbf{6 0 0}\).
- Adding an edge
- Method 1:
a = graph.addVertex(label,'user',id,'501','age','18-24');
b = graph.addVertex(label,'movie',id,'502','title','love');
a.addEdge('rate',b,'Rating','4'): This command is used to add an edge. IDs of the edge's two endpoints are 501 and 502.
- Method 2:
a = g.addV('user').property(id,'501').property('age','18-24');
b = g.addV('movie').property(id,'502').property('title','love');
g.addE('rate').property('Rating', '4').from(a).to(b): This command is used to add an edge. IDs of the edge's two endpoints are 501 and 502.
- Deleting an edge
g.E('501-502-0').drop(): This command is used to delete the edge whose ID is 501-502-0.
----End

\section*{Related Information}

Table 5-4 shows the differences between the Gremlin in GES and that in the open source community.

Table 5-4 Differences
\begin{tabular}{|l|l|}
\hline Difference & Description \\
\hline Vertex and Edge IDs & \begin{tabular}{l} 
An edge ID consists of the source vertex ID, target \\
vertex ID, and index that distinguishes duplicate \\
edges. The three parts are connected by hyphens (-), \\
for example, sid-tid-index. Edge and vertex IDs must \\
be the string type.
\end{tabular} \\
\hline User Supplied IDs & \begin{tabular}{l} 
Users can only provide vertex IDs without hyphens \\
\((-)\).
\end{tabular} \\
\hline Vertex Property IDs & \begin{tabular}{l} 
Both edge and vertex properties do not have IDs. The \\
returned IDs are vertex IDs.
\end{tabular} \\
\hline \begin{tabular}{l} 
Vertex and Edge \\
Property
\end{tabular} & \begin{tabular}{l} 
Vertex and edge properties are defined by metadata \\
files in GES. Therefore, you cannot add or delete \\
properties, but you can use property() and remove() \\
to modify property values. The value set by \\
property() is determined by the corresponding \\
parameter. remove() converts string properties into \\
empty strings, digital properties into 0, and list \\
properties into empty lists.
\end{tabular} \\
\hline Variables & \begin{tabular}{l} 
The GES graph structure does not support the \\
variables feature.
\end{tabular} \\
\hline Cardinality & \begin{tabular}{l} 
GES supports the single and list cardinality. The value \\
type of a vertex property is defined by the metadata \\
file. Therefore, no new property is added when you \\
set the property value.
\end{tabular} \\
\hline Transactions & \begin{tabular}{l} 
During GES Gremlin implementation, transactions are \\
not explicitly used.
\end{tabular} \\
\hline
\end{tabular}

You can use the feature function to view the supported Gremlin features. If false is displayed, GES does not support the feature. If true is displayed, GES supports the feature. For details about the features, visit the Gremlin official website.
gremlin> graph.features()
==>FEATURES

\section*{NOTE}

Currently, the following step commands are not supported:
- tryNext()
- explain()
- tree()

\subsection*{5.4 Analyzing Graphs Using Algorithms}

\section*{Scenario}

In scenarios such as social networking and e-commerce recommendation, graph algorithms can be used for relationship analysis and social community discovery. For example, you can use the PageRank algorithm to analyze key roles in social networks, use the Shortest Path algorithm to find relationship paths and recommend friends among the roles, and use the K-core algorithm to discover small circles.

\section*{Procedure}

Step 1 Log in to the GES graph editor. For details, see Accessing the GES Graph Editor.
Step 2 In the algorithm library area, you can select an algorithm and set its parameters.
Algorithm List shows the algorithms supported by GES and Algorithms describes the algorithm details.

Figure 5-11 Setting algorithm parameters

Step 3 Run the algorithm by clicking ©. You can view the query result after the analysis is complete.

Figure 5-12 Viewing the analysis result

Step 4 Take the movie data in the template as an example. After the parameters are adjusted, the PageRank value changes, but the top rank is nearly the same.

The two most influential movies, that is, the ID Lethal Weapon and ID Jaws, are selected.

Figure 5-13 Adjusting parameters
\begin{tabular}{l} 
Graph Analytics \\
alpha P PageRank \\
\hline 0.25 \\
convergence ? ? ? \\
\hline 0.00001 \\
max_iterations © ? \\
\hline 1000 \\
directed ? ? \\
\hline Default: true \\
\hline
\end{tabular}

Figure 5-14 Query result after the parameters are adjusted

Step 5 Run the Link Prediction algorithm to analyze the association degree of the two movies. The degree is 0.35 , indicating that many people have watched both the two movies.

Figure 5-15 Association analysis

Figure 5-16 Association analysis result

\subsection*{5.5 Analyzing Graphs on the Canvas}

\section*{Scenario}

The canvas intuitively displays the graph data. You can also edit and analyze data in this area.

For details about the shortcut keys and interface elements on the canvas, see Table 5-3.

\section*{Procedure}

Step 1 Log in to the GES graph editor. For details, see Accessing the GES Graph Editor.
Step 2 On the canvas, right-click a vertex or an edge, and perform the following operations:

Figure 5-17 Shortcut menu

\section*{View Property}

Search by Association
Export
Search by Path

\section*{Shortest Path of the Vertex Sets}

Common Neighbors of the Vertex Sets

\section*{Sub Graph}

Hide
- View Property

Select View Property to view the property information about the selected vertex or edge on the Property tab page.

Figure 5-18 View Property

- Search by Association

You can select OUT, IN, and ALL to expand vertices related to the current vertex.
- OUT: Query the vertices using this vertex as the source vertex.
- IN: Query the vertices using this vertex as the target vertex.
- ALL: Query all vertices of OUT and IN.
- Export

Export the graph or data displayed on the canvas.
- Search by Path

Query paths between two vertices. All possible paths are listed.
Procedure: Hold down Ctrl and click two vertices. The first is the target vertex and the second is the source vertex. Then, Right-click and choose Search by Path from the shortcut menu.NOTE
This option is valid only when two vertices are selected. Otherwise, it is dimmed. After this function is executed, the canvas is cleared, and then the queried vertex and edge data is returned and rendered in the canvas. A path is formed based on the selected two vertices.

Figure 5-19 Search by path

- Shortest Path of the Vertex Sets
a. Hold down Shift and box-select a group of vertices (a single vertex or multiple vertices).
b. Hold down Shift and box-select another group of vertices (a single vertex or multiple vertices).
c. Right-click in the selection box and choose Shortest Path of the Vertex Sets from the shortcut menu.
d. In the dialog box that is displayed, you can edit the selected two sets of vertices and click + to quickly add vertices.
e. Click Run. The shortest paths between two vertex sets are returned.
- Common Neighbors of Vertex Sets
- Function

By box-selecting the common neighbors of two vertex sets, you can intuitively discover the objects associated with the two sets.
- Procedure
i. Hold down Shift and box-select two vertex sets.

Figure 5-20 Box-selecting vertex sets

ii. Right-click a vertex set and choose Common Neighbors of Vertex Sets from the shortcut menu.

Figure 5-21 Common Neighbors of Vertex Sets

iii. In the dialog box that is displayed, confirm the vertices in the vertex sets. You can add or delete vertices as required, and then click Run.

Figure 5-22 Confirming the vertices in the vertex sets

iv. Display the result.

Figure 5-23 Graph Display

Figure 5-24 Query Result

- Sub Graph: Press and hold Ctrl and select some vertices. The edges between those vertices and the selected vertices form a new graph.
- Add Edge: You can add an edge using either of the following methods:
a. Hold down Ctrl, select any two vertices on the canvas, right-click the selected vertices, and choose Add Edge from the shortcut menu to add an edge between the vertices. By default, the vertex selected first is the source vertex, and that selected later is the target vertex. After the edge is added, you can select the label of the edge and set the edge properties.
b. Select a vertex, press Alt+A, drag the cursor to the target vertex, and leftclick to add an edge.
- Hide: Hide the selected vertex.
----End

\subsection*{5.6 Filtering Conditions}

\section*{Scenario}

To facilitate graph data analysis, you can set filtering conditions to further filter and analyze the graph data.

\section*{Procedure}

Step 1 Log in to the GES graph editor. For details, see Accessing the GES Graph Editor.
Step 2 Click \({ }^{4}\) on the right of the canvas, or select a vertex on the canvas, right-click it, and choose View Property, to display the Filtering and Property page.

Step 3 In the Filtering and Property area, set the filtering conditions and click Filter.
- Match: Vertex is selected by default. Possible values are Vertex and Edge.
- Type: All types is selected by default. You can select the vertex or edge type from the drop-down list. The type is defined by the metadata file you upload.
- Add filtering condition: Click Add filtering condition to select a property and choose a condition (Less than, Greater than, Equal to, Not equal to, In range, Existent, Non-existent, Greater than or equal to, or Less than or
equal to). Properties are defined by the metadata file you upload. You can add multiple filtering conditions or click Delete to delete set conditions.

Figure 5-25 Setting filtering conditions

Step 4 After the execution is complete, the filtering result is displayed in the drawing area and result area.
----End

\subsection*{5.7 View Running Records}

\section*{Scenario}

The system records your operations so that you can learn the execution progress and completion time when analyzing data.

\section*{Procedure}

Step 1 Log in to the GES graph editor. For details, see Accessing the GES Graph Editor.
Step 2 Execute a Gremlin command for querying or an algorithm for analysis. Then the Running Record tab page displays the operation statistics.
- After a Gremlin command is executed, the local time, and the command name and content are displayed in the Running Record tab page.

Figure 5-26 Gremlin running record

- After an algorithm is executed, the local time, algorithm name, and running status are displayed on the Running Record tab page. The running statuses include waiting to run, running, and ran successfully.

Figure 5-27 Algorithm running record
\begin{tabular}{l} 
Running Record Query Result \\
\hline \(1 \mid[2020-11-02\) 15:32:47] PageRank The algorithm is waiting to run. \\
2
\end{tabular}
----End

\subsection*{5.8 Viewing Query Results}

\section*{Scenario}

After data analysis is complete, you can directly view the result on the canvas or on the Query Result tab page.

\section*{Procedure}

Step 1 Log in to the GES graph editor. For details, see Accessing the GES Graph Editor.
Step 2 Execute a Gremlin command for querying or an algorithm for analysis. Then the Query Result tab page displays the query results.
If the result is too large to be completely displayed on the canvas and result area, click the Export button in the upper right corner to download the analysis result.
- Run a Gremlin command. The command output is quickly displayed. For example, if you run the \(\mathbf{g . V}()\).limit(100) command, the result is as follows:

Figure 5-28 Gremlin output

- Run an algorithm. The running time and result are displayed. For example, if you run PageRank, the result is as follows:

Figure 5-29 Algorithm output

\section*{6.}

\subsection*{6.1 Algorithm List}

To meet the requirements of various scenarios, GES provides extensive basic graph algorithms, graph analytics algorithms, and graph metrics algorithms. The following table lists the algorithms:

Table 6-1 Algorithm List
\begin{tabular}{|l|l|}
\hline Algorithm & Description \\
\hline PageRank & \begin{tabular}{l} 
PageRank, also known as web page ranking, is a hyperlink \\
analysis algorithm used to rank web pages (nodes) based on \\
their search engine results. PageRank is a way of measuring the \\
relevance and importance of web pages (nodes).
\end{tabular} \\
\hline PersonalRank & \begin{tabular}{l} 
PersonalRank is also called Personalized PageRank. It inherits \\
the idea of the classic PageRank algorithm and uses the graph \\
link structure to recursively calculate the importance of each \\
node. However, unlike the PageRank algorithm, to ensure that \\
the access probability of each node in the random walk can \\
reflect user preferences, the PersonalRank algorithm returns \\
each hop to the source node at a (1-alpha) probability during \\
random walk. Therefore, the relevance and importance of \\
network nodes can be calculated based on the source node (the \\
higher the PersonalRank value, the higher the correlation/ \\
importance of the source node).
\end{tabular} \\
\hline K-core & \begin{tabular}{l} 
K-core is a classic graph algorithm used to calculate the number \\
of cores of each node. The calculation result is one of the most \\
commonly used reference values for determining the \\
importance of a node so that the propagation capability of the \\
node can be better understood.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline Algorithm & Description \\
\hline K-hop & \begin{tabular}{l} 
K-hop is an algorithm used to search all nodes in the k layer \\
that are associated with the source node through breadth-first \\
search (BFS). The found sub-graph is the source node's ego-net. \\
The K-hop algorithm returns the number of nodes in the ego- \\
net.
\end{tabular} \\
\hline Shortest Path & \begin{tabular}{l} 
The Shortest Path algorithm is used to find the shortest path \\
between two nodes in a graph.
\end{tabular} \\
\hline \begin{tabular}{l} 
All Shortest \\
Paths
\end{tabular} & \begin{tabular}{l} 
The All Shortest Paths algorithm is used to find all shortest \\
paths between two nodes in a graph.
\end{tabular} \\
\hline SSSP & \begin{tabular}{l} 
The SSSP algorithm finds the shortest paths from a specified \\
node (source node) to all other nodes.
\end{tabular} \\
\hline \begin{tabular}{l} 
Shortest Path \\
of Vertex Sets
\end{tabular} & \begin{tabular}{l} 
The Shortest Path of Vertex Sets algorithm finds the shortest \\
path between two vertex sets. It can be used to analyze the \\
relationships between blocks in scenarios such as Internet social \\
networking, financial risk control, road network transportation, \\
and logistics delivery.
\end{tabular} \\
\hline n-Paths & \begin{tabular}{l} 
The n-Paths algorithm is used to find the \(n\) paths between two \\
vertices on the k layer of a graph. It applies to scenarios such as \\
relationship analysis, path design, and network planning.
\end{tabular} \\
\hline \begin{tabular}{l} 
Closeness \\
Centrality
\end{tabular} & \begin{tabular}{l} 
Closeness centrality is the average distance from a node to all \\
other reachable nodes. It can be used to measure the time for \\
transmitting information from this node to other nodes. A small \\
Closeness Centrality within a node corresponds to a central \\
location of the node.
\end{tabular} \\
\hline Louvain & \begin{tabular}{l} 
The Label Propagation algorithm is a graph-based semi- \\
supervised learning method. Its basic principle is to predict the \\
label information about unlabeled nodes using that of the \\
labeled nodes. This algorithm can create graphs based on the \\
relationships between samples. Nodes include labeled data and \\
unlabeled data, and the edge indicates the similarity between \\
two nodes. Node labels are transferred to other nodes based on \\
the similarity. Labeled data is like a source used to label \\
unlabeled data. Greater node similarity corresponds to an easier \\
label propagation.
\end{tabular} \\
\hline \begin{tabular}{l} 
Link \\
Prediction \\
Propagain is a modularity-based community detection algorithm \\
with high efficiency and effect. It detects hierarchical \\
community structures and aims to maximize the modularity of \\
the entire community network.
\end{tabular} \\
\hline \begin{tabular}{l} 
The Link Prediction algorithm is used to calculate the similarity \\
between two nodes and predict their relationship based on the \\
Jaccard measurement method.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline Algorithm & Description \\
\hline Node2vec & By invoking the Word2vec algorithm，the Node2vec algorithm maps nodes in the network to the Euclidean space，and uses vectors to represent the node characteristics．The Node2vec algorithm generates random steps from each node using the rollback parameter \(\mathbf{P}\) and forward parameter \(\mathbf{Q}\) ．It combines BFS and DFS．The rollback probability is proportional to \(1 / P\) ，and the forward probability is proportional to \(1 / \mathrm{Q}\) ．Multiple random steps are generated to reflect the network structures． \\
\hline Real－time Recommenda tion & The Real－time Recommendation algorithm is based on the random walk model and is used to recommend nodes that are similar（have similar relationships or preferences）to the input node．This algorithm can be used to recommend similar products based on historical purchasing or browsing data or recommend potential friends with similar preferences． \\
\hline Common Neighbors & Common Neighbors is a basic graph analysis algorithm that obtains the neighboring nodes shared by two nodes and further speculate the potential relationship and similarity between the two nodes．For example，it can intuitively discover shared friends in social occasions or commodities that interest both nodes in the consumption field． \\
\hline Connected Component & \begin{tabular}{l}
A connected component stands for a sub－graph，in which all nodes are connected with each other．Path directions are involved in the strongly connected components and are not considered in the weakly connected components． \\
note \\
This algorithm generates weakly connected components．
\end{tabular} \\
\hline Degree Correlation & The Degree Correlation algorithm calculates the Pearson correlation coefficient between the source vertex degree and the target vertex degree of each edge．It is used to indicate whether the high－degree nodes are connected to other high－ degree nodes in a graph． \\
\hline Triangle Count & The Triangle Count algorithm counts the number of triangles in a graph without considering the edge directions．More triangles mean higher node association degrees and closer organization relationships． \\
\hline Cluster Coefficient & The cluster coefficient is a measure of the degree to which nodes in a graph tend to cluster together．Evidence suggests that in most real－world networks，and in particular social networks，nodes tend to create tightly knit groups characterized by a relatively high density of ties． \\
\hline \begin{tabular}{l}
点集共同邻居 \\
（ Common \\
Neighbors of \\
Vertex Sets ）
\end{tabular} & 可以得到两个点集合（群体集合）所共有的邻居（即两个群体临域的交集），直观的发现与两个群体共同联系的对象，如发现社交场合中的共同好友，消费领域共同感兴趣的商品，社区群体共同接触过的人，进一步推测两点集合之间的潜在关系和联系程度。 \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline Algorithm & Description \\
\hline 点集全最短路 & 点集最短路算法用于发现两个点集之间的所有最短路径，可应用于 \\
（All Shortest & 互联网社交，金融风控，路网交通，物流配送等场景下的区块之间 \\
Paths of \\
Vertex Sets ） & 关系的分析。 \\
\hline
\end{tabular}

\section*{6．2 PageRank}

\section*{Overview}

PageRank，also known as web page ranking，is a hyperlink analysis algorithm used to rank web pages（nodes）based on their search engine results．PageRank is a way of measuring the relevance and importance of web pages（nodes）．
－If a web page is linked to many other web pages，the web page is of great importance．That is，the PageRank value is relatively high．
－If a web page with a high PageRank value is linked to another web page，the PageRank value of the linked web page increases accordingly．

\section*{Application Scenarios}

This algorithm applies to scenarios such as web page sorting and key role discovery in social networking．

\section*{Parameter Description}

Table 6－2 PageRank algorithm parameters
\begin{tabular}{|l|l|l|l|l|l|}
\hline Parameter & \begin{tabular}{l} 
Mandat \\
ory
\end{tabular} & Description & Type & Value Range & \begin{tabular}{l} 
Default \\
Value
\end{tabular} \\
\hline alpha & No & \begin{tabular}{l}

iterations
\end{tabular} & Int & \(1-2,000\) & 1,000 \\
\hline directed & No & \begin{tabular}{l} 
Whether to \\
consider the \\
edge \\
direction
\end{tabular} & Bool & true or false & true \\
\hline
\end{tabular}

\section*{\(\square\) \\ NOTE}
- alpha determines the jump probability coefficient, also called damping coefficient, which is a computing control variable in the algorithm.
- convergence defines the sum and upper limit of absolute values of each vertex in each iteration compared with the last iteration. If the sum is less than the value, the computing is considered to be converged and the algorithm stops.

\section*{Precautions}

When the convergence is set to a large value, the iteration will stop quickly.

\section*{Example}

Set parameters alpha to 0.85 , coverage to 0.00001 , max_iterations to 1,000 , and directed to true. The sub-graph formed by top nodes in the calculation result is displayed on the canvas. The size of a node varies with the PageRank values. The JSON result is displayed in the query result area.

\subsection*{6.3 PersonalRank}

\section*{Overview}

PersonalRank is also called Personalized PageRank. It inherits the idea of the classic PageRank algorithm and uses the graph link structure to recursively calculate the importance of each node. However, unlike the PageRank algorithm, to ensure that the access probability of each node in the random walk can reflect user preferences, the PersonalRank algorithm returns each hop to the source node at a (1-alpha) probability during random walk. Therefore, the relevance and importance of network nodes can be calculated based on the source node. (The higher the PersonalRank value, the higher the correlation/importance of the source node.)

\section*{Application Scenarios}

This algorithm applies to fields such as commodity, friend, and web page recommendations.

\section*{Parameter Description}

\end{tabular} & Bool & true or false & true \\
\hline
\end{tabular}

\section*{\(\square\) NOTE}
- alpha determines the jump probability coefficient, also called damping coefficient, which is a computing control variable in the algorithm.
- convergence defines the sum and upper limit of absolute values of each vertex in each iteration compared with the last iteration. If the sum is less than the value, the computing is considered to be converged and the algorithm stops.

\section*{Precautions}

When the convergence is set to a large value, the iteration will stop quickly.

\section*{Example}

Set parameters source to Lee, alpha to \(\mathbf{0 . 8 5}\), convergence to \(\mathbf{0 . 0 0 0 0 1}\), max_iterations to 1,000 , and directed to true. The sub-graph formed by top nodes in the calculation result is displayed on the canvas. The size of a node varies with the PersonalRank values. The JSON result is displayed in the query result area.

\subsection*{6.4 K-core}

\section*{Overview}

K-core is a classic graph algorithm used to calculate the number of cores of each node. The calculation result is one of the most commonly used reference values for determining the importance of a node so that the propagation capability of the node can be better understood.

\section*{Application Scenarios}

This algorithm applies to scenarios such as community discovery and finance risk control.

\section*{Parameter Description}

Table 6-4 K-core algorithm parameters
\begin{tabular}{|l|l|l|l|l|l|}
\hline \begin{tabular}{l} 
Parame \\
ter
\end{tabular} & \begin{tabular}{l} 
Mandat \\
ory
\end{tabular} & Description & \begin{tabular}{l}

\end{tabular} & \begin{tabular}{l} 
Default \\
Value
\end{tabular} \\
\hline\(k\) & Yes & \begin{tabular}{l} 
Number of cores \\
The algorithm returns \\
nodes whose number \\
of cores is greater \\
than or equal to \(k\).
\end{tabular} & Int & \begin{tabular}{l} 
Greater \\
than or \\
equal to 0
\end{tabular} & - \\
\hline
\end{tabular}

\section*{Precautions}

None

Example
Set parameter \(\mathbf{k}\) to \(\mathbf{1 0}\). The sub-graph formed by nodes whose number of cores is greater than or equal to 10 in the calculation result is displayed on the canvas. The color of a node varies with the number of cores. The JSON result is displayed in the query result area.

\subsection*{6.5 K-hop}

\section*{Overview}

K-hop is an algorithm used to search all nodes in the k layer that are associated with the source node through breadth-first search (BFS). The found sub-graph is the source node's ego-net. The K-hop algorithm returns the number of nodes in the ego-net.

\section*{Application Scenarios}

This algorithm applies to scenarios such as relationship discovery, influence prediction, and friend recommendation.

\section*{Parameter Description}

Table 6-5 K-hop algorithm parameters
\begin{tabular}{|l|l|l|l|l|l|}
\hline \begin{tabular}{l} 
Parame \\
ter
\end{tabular} & \begin{tabular}{l} 
Mandat \\
ory
\end{tabular} & Description & Type & Value Range & \begin{tabular}{l} 
Default \\
Value
\end{tabular} \\
\hline k & Yes & Number of hops & Integer & \(1-100\) & - \\
\hline source & Yes & Node ID & String & - & - \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|l|l|l|}
\hline \begin{tabular}{l} 
Parame \\
ter
\end{tabular} & \begin{tabular}{l} 
Mandat \\
ory
\end{tabular} & Description & Type & Value Range & \begin{tabular}{l} 
Default \\
Value
\end{tabular} \\
\hline mode & No & \begin{tabular}{l} 
Direction: \\
- OUT: Hop \\
from the \\
outgoing \\
edges. \\
- IN: Hop from \\
the incoming \\
edges. \\
- All: Hop from \\
edges in both \\
directions.
\end{tabular} & String & OUT, IN, ALL & OUT \\
\hline
\end{tabular}

\section*{Precautions}
- A larger \(k\) value indicates a wider node coverage area.
- According to the six degrees of separation theory, all people in social networks will be covered after six hops.
- BFS searches information based on edges.

\section*{Example}

Calculate the sub-graph formed by the three hops starting from the Lee node.
Set parameters \(\mathbf{k}\) to \(\mathbf{3}\), source to Lee, and mode to OUT. The sub-graph is displayed on the canvas, and the JSON result is displayed in the query result area.

\subsection*{6.6 Shortest Path}

\section*{Overview}

The Shortest Path algorithm is used to find the shortest path between two nodes in a graph.

\section*{Application Scenarios}

This algorithm applies to scenarios such as path design and network planning.

\section*{Parameter Description}

\hline
\end{tabular}

\section*{Precautions}

This algorithm only returns one shortest path.

\section*{Example}

Calculate the shortest path from the Lee node to the Alice node.
Set parameters source to Lee, target to Alice, weight to weights, and directed to false. The shortest path is displayed on the canvas, and the JSON result is displayed in the result area.

\subsection*{6.7 All Shortest Paths}

\section*{Overview}

The All Shortest Paths algorithm is used to find all shortest paths between two nodes in a graph.

\section*{Application Scenarios}

This algorithm applies to scenarios such as path design and network planning.

\section*{Parameter Description}

Table 6-8 All Shortest Paths algorithm parameters

Example
Set parameters source to Lee, target to Alice, and directed to false. The calculation result is displayed on the canvas and the JSON result is displayed in the query result area.

\subsection*{6.8 Filtered Shortest Path}

\section*{Overview}

The Filtered Shortest Path algorithm is used to search for the shortest path that meets the filtering criteria between two vertices. If there are multiple shortest paths, any one of them is returned.

\section*{Application Scenarios}

This algorithm applies to path design and network planning. It generates the shortest path based on vertex and edge filtering criteria.

\section*{Parameter Description}

Table 6-9 Filtered Shortest Path algorithm parameters

an
\end{tabular} & \begin{tabular}{l} 
Whether to consider the edge direction The \\
default value is false.
\end{tabular} \\
\hline
\end{tabular}

\section*{Precautions}

This algorithm only returns one shortest path.

\subsection*{6.9 SSSP}

\section*{Overview}

The SSSP algorithm finds the shortest paths from a specified node (source node) to all other nodes.

\section*{Application Scenarios}

This algorithm applies to scenarios such as path design and network planning.

\section*{Parameter Description}

Table 6-10 SSSP algorithm parameters
\begin{tabular}{|l|l|l|l|l|l|}

Whether to \\
consider the \\
edge direction
\end{tabular} & Bool & true or false & true \\
\hline
\end{tabular}

\section*{Example}

Calculate the shortest paths from the Lee node to other nodes.
Set parameters source to Lee and directed to true.

\subsection*{6.10 Shortest Path of Vertex Sets}

\section*{Overview}

The Shortest Path of Vertex Sets algorithm finds the shortest path between two vertex sets.

\section*{Application Scenarios}

This algorithm applies to block relationship analysis in Internet social networking, financial risk control, road network transportation, and logistics delivery scenarios.

\section*{Parameter Description}

\end{tabular}

\section*{\(\infty\) \\ NOTE}

If a vertex ID contains commas (,), add double quotation marks to it. For example, when Paris, je taime and Alice IDs are used as sources, the ID set is "Paris, je taime",Alice".

\section*{Example}

Set parameters directed to true, sources to "Alice,Nana", and targets to
"Lily,Amy". The JSON result is displayed in the query result area.

\subsection*{6.11 n-Paths}

\section*{Overview}

The n -Paths algorithm is used to find the \(n\) paths between two nodes within the layers of relationships in a graph.

\section*{Application Scenarios}

This algorithm applies to scenarios such as relationship analysis, path design, and network planning.

\section*{Parameter Description}

Table 6-13 n-Paths algorithm parameters
\begin{tabular}{|l|l|l|l|l|l|}
\hline \begin{tabular}{l} 
Paramet \\
er
\end{tabular} & \begin{tabular}{l}

\end{tabular} & false \\
\hline\(n\) & No & Number of paths & Int & \(1-100\) & 10 \\
\hline k & No & Number of hops & Int & \(1-10\) & 5 \\
\hline
\end{tabular}

\section*{Example}

Set parameters source to Lee, target to Alice, \(\mathbf{n}\) to \(\mathbf{1 0}, \mathbf{k}\) to \(\mathbf{5}\), and directed to false. The calculation result is displayed on the canvas and the JSON result is displayed in the query result area.

\subsection*{6.12 Closeness Centrality}

\section*{Overview}

Closeness centrality of a node is a measure of centrality in a network, calculated as the reciprocal of the sum of the length of the shortest paths between the node and all other reachable nodes in a graph. It can be used to measure the time for transmitting information from this node to other nodes. The bigger the node's Closeness Centrality is, the more central the location of the node will be.

\section*{Application Scenarios}

This algorithm is used in key node mining in social networking.

\section*{Parameter Description}

Table 6-14 Closeness Centrality algorithm parameters
\begin{tabular}{|l|l|l|l|l|l|}
\hline \begin{tabular}{l} 
Paramet \\
er
\end{tabular} & \begin{tabular}{l} 
Mandato \\
ry
\end{tabular} & Description & Type & \begin{tabular}{l}

Value
\end{tabular} \\
\hline source & Yes & \begin{tabular}{l} 
Enter the ID of \\
the node to be \\
calculated.
\end{tabular} & String & - & - \\
\hline
\end{tabular}

\section*{Example}

Set parameter source to Lee to calculate the closeness centrality of the Lee node. The JSON result is displayed in the query result area.

\subsection*{6.13 Label Propagation}

\section*{Overview}

The Label Propagation algorithm is a graph-based semi-supervised learning method. Its basic principle is to predict the label information about unlabeled nodes using that of the labeled nodes. This algorithm can create graphs based on the relationships between samples. Nodes include labeled data and unlabeled data, and the edge indicates the similarity between two nodes. Node labels are transferred to other nodes based on the similarity. Labeled data is like a source used to label unlabeled data. The greater the node similarity is, the easier the label propagation will be.

\section*{Application Scenarios}

This algorithm applies to scenarios such as information propagation, advertisement recommendation, and community discovery.

\section*{Parameter Description}

Table 6-15 Label Propagation algorithm parameters
\begin{tabular}{|l|l|l|l|l|l|}

initial is not null, \\
the number of \\
vertices with \\
initialization \\
labels must be \\
greater than 0 \\
and less than the \\
total number of \\
vertices.
\end{tabular} & \\
\hline
\end{tabular}

\section*{Precautions}

Label Propagation uses IDs as labels by default.

\section*{Example}

Set parameters coverage to 0.00001 and max_iterations to \(\mathbf{1 , 0 0 0}\), the sub-graphs with different labels are displayed on the canvas. The color of a node varies with labels. The JSON result is displayed in the query result area.

\subsection*{6.14 Louvain}

\section*{Overview}

Louvain is a modularity-based community detection algorithm with high efficiency and effect. It detects hierarchical community structures and aims to maximize the modularity of the entire community network.

\section*{Application Scenarios}

This algorithm applies to scenarios such as community mining and hierarchical clustering.

\section*{Parameter Description}

Table 6-16 Louvain algorithm parameters
\begin{tabular}{|l|l|l|l|l|l|}
\hline Parameter & \begin{tabular}{l} 
Mandat \\
ory

- Character string: The attribute of the correspondin g edge is the weight. When the edge does not have correspondin g attribute, the weight is 1 by default. \\
NOTE \\
The weight of an edge must be greater than \(\mathbf{0}\).
\end{tabular} & weight \\
\hline
\end{tabular}

\section*{Precautions}

This algorithm generates only the final community result and does not save the hierarchical results.

\section*{Example}

Set parameters coverage to 0.00001 and max_iterations to 100, the sub-graphs of different communities are displayed on the canvas. The color of a node varies with communities. The JSON result is displayed in the query result area.

\subsection*{6.15 Link Prediction}

\section*{Overview}

The Link Prediction algorithm is used to calculate the similarity between two nodes and predict their relationship based on the Jaccard measurement method.

\section*{Application Scenarios}

This algorithm applies to scenarios such as friend recommendation and relationship prediction in social networks.

\section*{Parameter Description}

Table 6-17 Link Prediction algorithm parameters
\begin{tabular}{|l|l|l|l|l|l|}
\hline \begin{tabular}{l} 
Paramet \\
er
\end{tabular} & \begin{tabular}{l}

\end{tabular} & String & - & - \\
\hline
\end{tabular}

\section*{Example}

Set parameters source to Lee and target to Alice to calculate the association between two nodes. The JSON result is displayed in the query result area.

\subsection*{6.16 Node2vec}

\section*{Overview}

By invoking the Word2vec algorithm, the Node2vec algorithm maps nodes in the network to the Euclidean space, and uses vectors to represent the node characteristics.

The Node2vec algorithm generates random steps from each node using the rollback parameter \(\mathbf{P}\) and forward parameter \(\mathbf{Q}\). It combines BFS and DFS. The rollback probability is proportional to \(1 / \mathrm{P}\), and the forward probability is proportional to \(1 / Q\). Multiple random steps are generated to reflect the network structures.

\section*{Application Scenarios}

This algorithm applies to scenarios such as node function similarity comparison, structural similarity comparison, and community clustering.

\section*{Parameter Description}

iterations
\end{tabular} & Int & \begin{tabular}{l}
1 to 100, including 1 \\
and 100
\end{tabular} & 10 \\
\hline
\end{tabular}

\section*{Precautions}

None

\section*{Example}

Set parameters \(\mathbf{P}\) to \(\mathbf{1}, \mathbf{Q}\) to \(\mathbf{0 . 3}\), dim to \(\mathbf{3}\), walkLength to \(\mathbf{2 0}\), walkNumber to \(\mathbf{1 0}\), and iterations to 40 to obtain the three-dimensional vector display of each node.

\subsection*{6.17 Real-time Recommendation}

\section*{Overview}

The Real-time Recommendation algorithm is based on the random walk model and is used to recommend nodes that are similar (have similar relationships or preferences) to the input node.

\section*{Application Scenarios}

This algorithm can be used to recommend similar products based on historical purchasing or browsing data or recommend potential friends with similar preferences.

It is applicable to scenarios such as e-commerce and social networking.

\section*{Parameter Description}

Table 6-19 Real-time Recommendation algorithm parameters
\begin{tabular}{|c|c|c|c|c|c|}
\hline Parame ter & Mandat ory & Description & Type & Value Range & Defa ult Value \\
\hline sources & Yes & Node ID. Multiple node IDs separated by commas (,) are supported (standard CSV input format). & Strin g & The number of source nodes cannot exceed 30. & - \\
\hline alpha & No & Weight coefficient. A larger value indicates a longer step. & Dou ble & A real number between 0 and 1 (excluding 0 and 1) & 0.85 \\
\hline N & No & Total number of walk steps & Int & 1-200,000 & \[
\begin{aligned}
& 10,00 \\
& 0
\end{aligned}

\hline directed & No & \begin{tabular}{l} 
Whether to consider the \\
edge direction
\end{tabular} & Bool & true or false & true \\
\hline
\end{tabular}

\section*{\(\square\) \\ NOTE}
alpha determines the jump probability coefficient, also called damping coefficient, which is a computing control variable in the algorithm.

\section*{Precautions}

In the end conditions, the smaller the values of \(n v\) and \(n \mathbf{p}\), the faster the algorithm ends.

\section*{Example}

Set parameters sources to Lee, alpha to \(\mathbf{0 . 8 5}, \mathrm{N}\) to \(\mathbf{1 0 , 0 0 0}, \mathrm{nv}\) to \(5, \mathrm{np}\) to \(\mathbf{1 , 0 0 0}\), directed to true, and label to null.

The sub-graph formed by top nodes in the calculation result is displayed on the canvas. The size of a node varies with the final scores. The JSON result is displayed in the query result area.

\subsection*{6.18 Common Neighbors}

\section*{Overview}

Common Neighbors is a basic graph analysis algorithm that obtains the neighboring nodes shared by two nodes and further speculate the potential relationship and similarity between the two nodes. For example, it can intuitively discover shared friends in social occasions or commodities that interest both nodes in the consumption field.

\section*{Application Scenarios}

This algorithm applies to scenarios such as e-commerce and social networking.

\section*{Parameter Description}

Table 6-20 Common Neighbors algorithm parameters
\begin{tabular}{|l|l|l|l|l|l|}
\hline \begin{tabular}{l} 
Parame \\
ter
\end{tabular} & \begin{tabular}{l}

\hline target & Yes & \begin{tabular}{l} 
Enter the target \\
ID.
\end{tabular} & String & - & - \\
\hline
\end{tabular}

\section*{Precautions}

None

\section*{Example}

Set parameters source to Lee and target to Alice. The calculation result is displayed on the canvas and the JSON result is displayed in the query result area.

\subsection*{6.19 Connected Component}

\section*{Overview}

A connected component stands for a sub-graph, in which all nodes are connected with each other. Path directions are involved in the strongly connected components and are not considered in the weakly connected components. This algorithm generates weakly connected components.

\section*{Parameter Description}

None

\section*{Example}

Run the algorithm to calculate the connected component to which each node belongs. The JSON result is displayed in the query result area.

\subsection*{6.20 Degree Correlation}

\section*{Overview}

The Degree Correlation algorithm calculates the Pearson correlation coefficient between the source vertex degree and the target vertex degree of each edge. It is
used to indicate whether the high-degree nodes are connected to other highdegree nodes in a graph.

\section*{Application Scenarios}

This algorithm is often used to measure the structure features of a graph.

\section*{Parameter Description}

None

\section*{Example}

Run the algorithm to calculate the degree correlation of a graph. The JSON result is displayed in the query result area.

\subsection*{6.21 Triangle Count}

\section*{Overview}

The Triangle Count algorithm counts the number of triangles in a graph. More triangles mean higher node association degrees and closer organization relationships.

\section*{Application Scenarios}

This algorithm is often used to measure the structure features of a graph.

\section*{Parameter Description}
\begin{tabular}{|l|l|l|l|l|}
\hline \begin{tabular}{l} 
Paramet \\
er
\end{tabular} & \begin{tabular}{l}

number of triangles \\
corresponding to each \\
vertex.
\end{tabular} & \begin{tabular}{l} 
Boolea \\
\(n\)
\end{tabular} & \begin{tabular}{l} 
true or false. The \\
default value is \\
true.
\end{tabular} \\
\hline
\end{tabular}

\section*{Instructions}

The edge direction and multi-edge situation are not considered.

\section*{Example}

Enter statistics = true. The JSON result is displayed in the query result area.

\subsection*{6.22 Cluster Coefficient}

\section*{Overview}

The cluster coefficient is a measure of the degree to which nodes in a graph tend to cluster together. Evidence suggests that in most real-world networks, and in particular social networks, nodes tend to create tightly knit groups characterized by a relatively high density of ties. This algorithm is used to calculate the aggregation degree of nodes in a graph.

\section*{Application Scenarios}

This algorithm is often used to measure the structure features of a graph.

\section*{Parameter Description}

None

\section*{Instructions}

The multi-edge situation is not considered.

\section*{Example}

Run the algorithm to calculate the cluster coefficient of a graph. The JSON result is displayed in the query result area.

\subsection*{6.23 Common Neighbors of Vertex Sets}

\section*{Overview}

The Common Neighbors of Vertex Sets algorithm can find common neighbors of two vertex sets, and intuitively discover an object jointly associated with both sets, for example, a common friend in a social occasion, a commodity that is of common interest, a person who has been contacted by community groups. In this way, the algorithm infers the potential relationship and degree of association between the vertex sets.

\section*{Application Scenarios}

This algorithm applies to graph analysis such as relationship mining and product/ friend recommendations.

\section*{Parameter Description}

Table 6-21 Common Neighbors of Vertex Sets algorithm parameters
\begin{tabular}{|c|c|c|c|c|c|}
\hline Parameter & Mand atory & Descripti on & Type & Value Range & Default Value \\
\hline sources & Yes & \begin{tabular}{l}
Source \\
vertex ID set
\end{tabular} & String & \begin{tabular}{l}
The value is in the standard CSV format. IDs are separated by commas (,), for example, Alice, Nana. \\
The maximum ID number is 100,000.
\end{tabular} & - \\
\hline targets & Yes & Target vertex ID set & String & \begin{tabular}{l}
The value is in the standard CSV format. IDs are separated by commas (,), for example, Alice, Nana. \\
The maximum ID number is 100,000 .
\end{tabular} & - \\
\hline
\end{tabular}

\section*{Precautions}

None

\section*{Example}

Enter sources=Alice,Nana and targets=Mike,Amy. The calculation result is displayed on the canvas and the JSON result is displayed in the query result area.

\subsection*{6.24 All Shortest Paths of Vertex Sets}

\section*{Overview}

The Shortest Path of Vertex Sets algorithm finds the shortest path between vertex sets.

\section*{Application Scenarios}

This algorithm can be used to analyze relationships between blocks in scenarios such as Internet social networking, financial risk control, road network traffic, and logistics delivery.

\section*{Parameter Description}

Table 6-22 All Shortest Paths of Vertex Sets algorithm parameters
\begin{tabular}{|l|l|l|l|l|l|}
\hline \begin{tabular}{l} 
Param \\
eter
\end{tabular} & \begin{tabular}{l} 
Man \\
dato \\
ry
\end{tabular} & \begin{tabular}{l} 
Descripti \\
on
\end{tabular} & Type & Value Range & Default Value \\
\hline sources & Yes & \begin{tabular}{l} 
Source \\
vertex ID \\
set
\end{tabular} & \begin{tabular}{l} 
Strin \\
g
\end{tabular} & \begin{tabular}{l} 
The value is in the \\
standard CSV format. \\
IDs are separated by \\
commas (,), for \\
example, Alice, Nana. \\
The maximum ID \\
number is 100,000.
\end{tabular} & - \\
\hline targets & Yes & \begin{tabular}{l} 
Target \\
vertex ID \\
set
\end{tabular} & \begin{tabular}{l} 
Strin \\
g
\end{tabular} & \begin{tabular}{l} 
The value is in the \\
standard CSV format. \\
IDs are separated by \\
commas (,), for \\
example, Alice, Nana. \\
The maximum ID \\
number is 100,000.
\end{tabular} & - \\
\hline \begin{tabular}{l} 
directe \\
d
\end{tabular} & No & \begin{tabular}{l} 
Whether \\
to \\
consider \\
the edge \\
direction
\end{tabular} & \begin{tabular}{l} 
Boole \\
an
\end{tabular} & \begin{tabular}{l} 
true or false. It is a \\
Boolean value.
\end{tabular} & false \\
\hline
\end{tabular}

\section*{Precautions}

If a vertex ID contains commas (,), add double quotation marks to it. For example, when Paris, je taime and Alice IDs are used as sources, the ID set is "Paris, je taime",Alice".

\section*{Example}

Set parameters directed to true, sources to "Alice,Nana", and targets to "Lily,Amy". The JSON result is displayed in the query result area.

\section*{7 \\ GES Metrics}

\section*{Function}

This chapter describes metrics reported by GES to Cloud Eye as well as their namespaces, lists, and dimensions. You can use the management console and APIs provided by Cloud Eye to query the metric and alarm information generated for GES.

\section*{Namespace}

SYS.GES

\section*{Metrics}

Table 7-1 GES metrics
