

## Infant Mortality in the United States, 2019: Data From the Period Linked Birth/Infant Death File

by Danielle M. Ely, Ph.D., and Anne K. Driscoll, Ph.D.

### Abstract

**Objectives**—This report presents 2019 infant mortality statistics by age at death, maternal race and Hispanic origin, maternal age, gestational age, leading causes of death, and maternal state of residence. Trends in infant mortality are also examined.

**Methods**—Descriptive tabulations of data are presented and interpreted for infant deaths and infant mortality rates using the 2019 period linked birth/infant death file. The linked birth/infant death file is based on birth and death certificates registered in all states and the District of Columbia.

**Results**—A total of 20,927 infant deaths were reported in the United States in 2019, down 3% from 2018. The U.S. infant mortality rate was 5.58 infant deaths per 1,000 live

**Figure 1. Infant, neonatal, and postneonatal mortality rates: United States, 1995–2019**

births, a historic low for the country, although not significantly different from the rate of 5.67 in 2018. The neonatal mortality rate declined to 3.69 in 2019 from 3.78 in 2018, while the postneonatal mortality rate was unchanged from 2018 at 1.89. The mortality rate declined for infants of non-Hispanic white women in 2019 compared with 2018; declines in rates for the other race and Hispanic-origin groups were not significant. The 2019 infant mortality rate for infants of non-Hispanic black women (10.62) was more than twice as high as that for infants of non-Hispanic white (4.49), non-Hispanic Asian (3.38), and Hispanic (5.03) women. Infants born very preterm (less than 28 weeks of gestation) had the highest mortality rate (374.46), 184 times as high as that for infants born at term (37–41 weeks of gestation) (2.03). The five leading causes of infant death in 2019 were the same as in 2018. Infant mortality rates by state for 2019 ranged from a low of 3.21 in New Hampshire to a high of 8.71 in Mississippi.

**Keywords:** infant death • maternal and infant characteristics • vital statistics • National Vital Statistics System

## Introduction

This report presents infant mortality statistics based on data from the 2019 period linked birth/infant death file. Infant mortality and mortality rates are described by age at death, maternal race and Hispanic origin, maternal age, gestational age, leading causes of death, and maternal state of residence in the United States. Infant mortality trends are also presented by selected characteristics. In the linked file, information from the death certificate is linked to information from the birth certificate for each infant under age 1 year who died in the 50 states, District of Columbia (D.C.), Puerto Rico, or Guam during 2019 (1). The purpose of the linkage is to use variables available from the birth certificate to conduct more detailed analyses of infant mortality patterns (2,3). The linked birth/infant death data set also is the preferred source for examining infant mortality by race and Hispanic origin. Infant mortality rates by race and Hispanic origin are more accurately measured from the birth certificate compared with the death certificate.

For 2019, linked birth/infant death data are not available for American Samoa, Commonwealth of the Northern Marianas, and U.S. Virgin Islands. Some rates calculated from the mortality file differ from those published using the linked file. More details can be found elsewhere (1).

## Methods

Data shown in this report are based on birth and infant death certificates registered in all states, D.C., Puerto Rico, and Guam. As part of the Vital Statistics Cooperative Program, each state provides matching birth and death certificate numbers for each infant under age 1 year who died during 2019 to the National Center for Health Statistics. Further discussion of the process of linking births and deaths occurring in different states and file production can be found in the Methodology section of the “User Guide to the 2019 Period/2018 Cohort Linked Birth/Infant Death Public Use File” (1).

The period linked file for 2017 marked the first data year for which the linked birth data for infant deaths for all 50 states and D.C. were based on the 2003 revision of the U.S. Standard Certificate of Live Birth (4) and, accordingly, the first year for which national data on race and Hispanic-origin categories based on 1997 Office of Management and Budget (OMB) standards became available (5).

In 2019, 99.3% of all infant death records were successfully linked to their corresponding birth records. These records were weighted to adjust for the 0.7% of infant death records that were not linked to their corresponding birth certificates (1) (Technical Notes).

Information on births for age and race of mother is imputed if it is not reported on the birth certificate. In 2019, race of mother was imputed for 6.8% of births; mother’s age was imputed for 0.01% of births (2,3).

The race and Hispanic-origin groups shown in this report follow the 1997 OMB standards and differ from the bridged-race categories shown in previous reports (5). The categories are: non-Hispanic single-race white, non-Hispanic single-race black or African American, non-Hispanic single-race American Indian or Alaska Native (AIAN), non-Hispanic single-race Asian, non-Hispanic single-race Native Hawaiian or Other Pacific Islander (NHOPI), and Hispanic (for brevity, text references omit the term “single-race”). Race and Hispanic origin are reported separately on the birth certificate. Data are shown in most cases for four specified Hispanic groups: Mexican, Puerto Rican, Cuban, and Central and South American. Additional details on Hispanic origin are available (3). Comparisons between 2019 and 2018 by race and Hispanic origin are made in this report. The 2003 revision of the U.S. Standard Certificate of Live Birth allows the reporting of five race categories for each parent (6)—either alone, as in single race, or in combination, as in more than one race or multiple races—in accordance with the 1997 revised OMB standards (5). Further details on race reporting are available (3).

Cause-of-death statistics are classified in accordance with the *International Statistical Classification of Diseases and Related Health Problems, 10th Revision (ICD–10)* (7) (Technical Notes).

## Data by maternal and infant characteristics

This report presents descriptive tabulations of infant mortality data by a variety of maternal and infant characteristics. These tabulations are useful for understanding the basic relationships between risk factors and infant mortality, unadjusted for the possible effects of other variables. However, women with one risk factor may often have other risk factors as well. For example, teen mothers are more likely to be unmarried and of a low-income status, while mothers who do not receive prenatal care are more likely to be of a low-income status and uninsured. The preferred method for disentangling the multiple interrelationships among risk factors is multivariate analysis; however, an understanding of the basic relationships between risk factors and infant mortality is the first step before more sophisticated types of analyses and may help identify high-risk subgroups for prevention efforts. This report presents several key risk factors for infant mortality: age at death, maternal race and Hispanic origin, maternal age, gestational age, leading causes of infant death, and maternal

state of residence. For brevity, additional selected risk factors (sex, birthweight, plurality, and nativity [mother's place of birth]) are presented in tables but not discussed in this report.

**Race and Hispanic origin**—Infant mortality rates are presented by race and Hispanic origin of the mother. The linked file is useful for computing accurate infant mortality rates by these characteristics because the race and Hispanic origin of the mother from the birth certificate are used in both the numerator and denominator of the infant mortality rate. In contrast, for rates based on the vital statistics mortality file, race information for the denominator is the race of the mother as reported on the birth certificate, while race information for the numerator is the race of the decedent as reported on the death certificate (2,3,8). More detail on the reliability of race and Hispanic-origin data from the linked file compared with the mortality file is available (8).

**Statistical significance**—Statements in the text have been tested for statistical significance, and a statement that a given infant mortality rate is higher or lower than another rate indicates that the rates are significantly different using a two-tailed z test at the alpha level of 0.05. Information on the methods used to test for statistical significance, as well as information on differences between period and cohort data, the weighting of the linked file, maternal age, period of gestation, birthweight, and cause-of-death classification, also is available (1) (Technical Notes).

## Results

### Trends in infant mortality and infant age at death

- In 2019, 20,927 infant deaths were reported in the United States, a decline of 3% from 2018 (21,498). The infant mortality rate was 5.58 deaths per 1,000 live births in 2019, a nonsignificant decline from the 2018 rate of 5.67 and the lowest rate reported in U.S. history (Figure 1, Table 1).
- The U.S. infant mortality rate has generally trended downward since 1995 (the first year that the period linked birth/infant death file was available) and has declined 19% since 2005, the most recent high (6.86).
- The 2019 neonatal mortality rate (infant deaths at less than 28 days) declined 2% to 3.69 from 3.78 in 2018. The neonatal mortality rate has generally declined since 1995 and is also down 19% since 2005 (4.54).
- The 2019 postneonatal mortality rate (infant deaths at 28 days or more) was unchanged from 2018 (1.89). The postneonatal mortality rate has also generally declined since 1995 and is also down 19% since 2005 (2.32).

### Race and Hispanic origin

- The mortality rate for infants of non-Hispanic white women declined 3% from 2018 to 2019 (from 4.63 to 4.49 infant deaths per 1,000 births). Declines in rates for infants born to non-Hispanic black (10.75 to 10.62), non-Hispanic AIAN (8.15 to 7.87), non-Hispanic Asian (3.63 to 3.38),

and non-Hispanic NHOPI (9.39 to 8.19) women were not significant. A nonsignificant increase was found in the mortality rate for infants of Hispanic women from 2018 to 2019 (4.86 to 5.03) (Tables 1 and 2, Figure 2).

- Among Hispanic-origin subgroups, the mortality rate for infants of Central and South American women increased 13% from 2018 to 2019 (4.02 to 4.53); declines in mortality rates for infants of Mexican and Cuban women were not significant between the 2 years. The increase in the mortality rate for infants of Puerto Rican women was not significant (5.61 to 6.17).
- In 2019, infant mortality continued to vary by race: Infants of non-Hispanic black women had the highest mortality rate (10.62), followed by infants of non-Hispanic NHOPI (8.19), non-Hispanic AIAN (7.87), Hispanic (5.03), non-Hispanic white (4.49), and non-Hispanic Asian (3.38) women.
- Infants of non-Hispanic black women also had the highest neonatal mortality rate in 2019 (6.85) compared with infants of the other race and Hispanic-origin groups; the lowest mortality rate was for infants of non-Hispanic Asian women (2.52).
- In 2019, postneonatal mortality rates were higher for infants of non-Hispanic AIAN (3.87), non-Hispanic black (3.77), and non-Hispanic NHOPI (3.17) women than for infants of non-Hispanic white (1.57), Hispanic (1.55), and non-Hispanic Asian (0.85) women.
- Among Hispanic-origin subgroups in 2019, infants of Puerto Rican women had the highest mortality rate (6.17), followed by infants of Mexican (4.96), Central and South American (4.53), and Cuban (4.14) women.

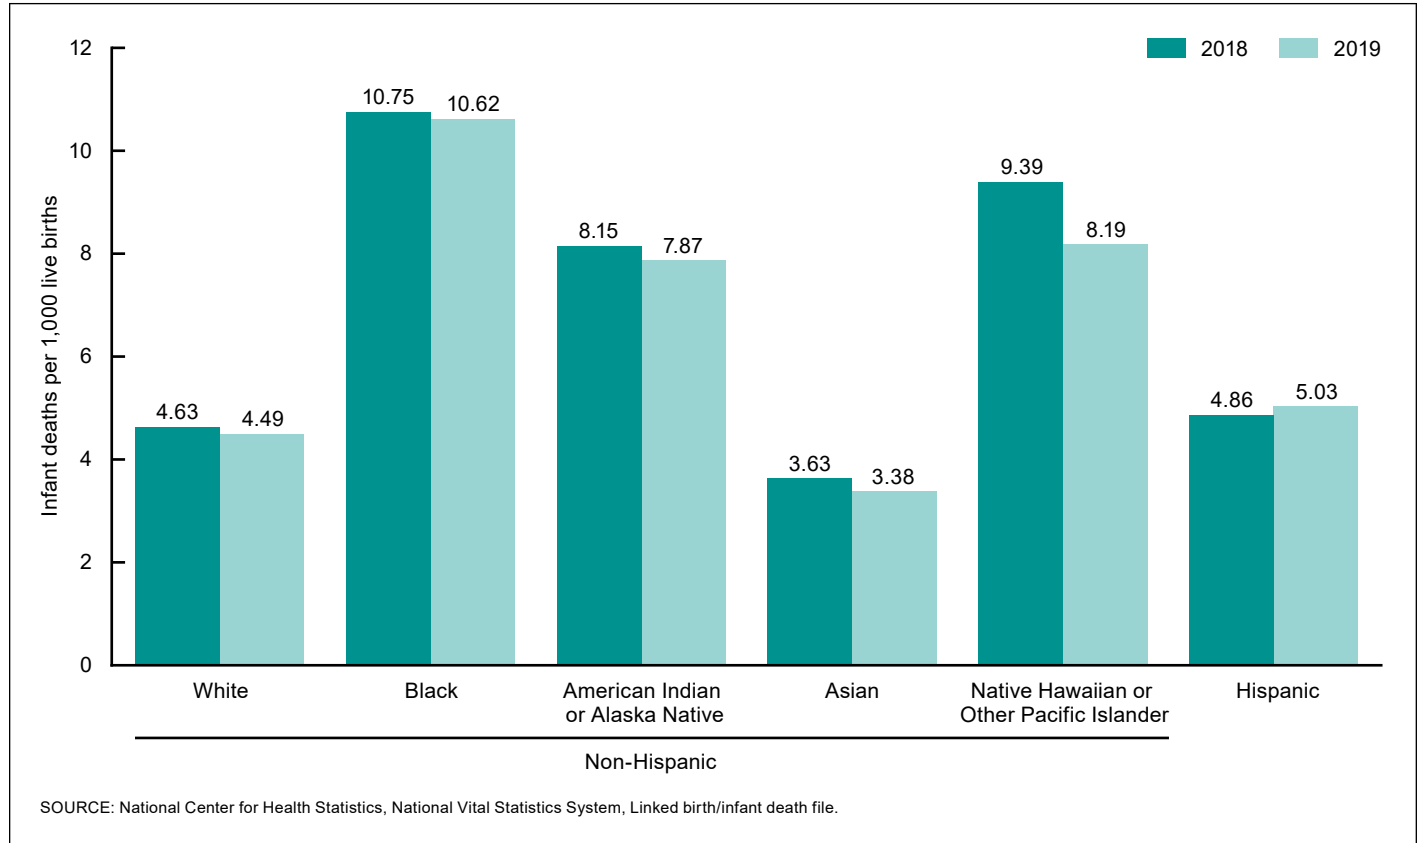

### Maternal age

- No significant changes were found in mortality rates for infants of women in any maternal age group between 2018 and 2019. Rates declined for infants of women aged 20–39 and increased for infants of women under age 20 and aged 40 and over, but these changes were not significant (Figure 3, Table 2).
- Mortality rates were highest for infants of females under age 20 (8.68 infant deaths per 1,000 births), decreased to a low of 4.57 for infants of women aged 30–34, and then increased to 7.01 for infants of women aged 40 and over (the second-highest rate).

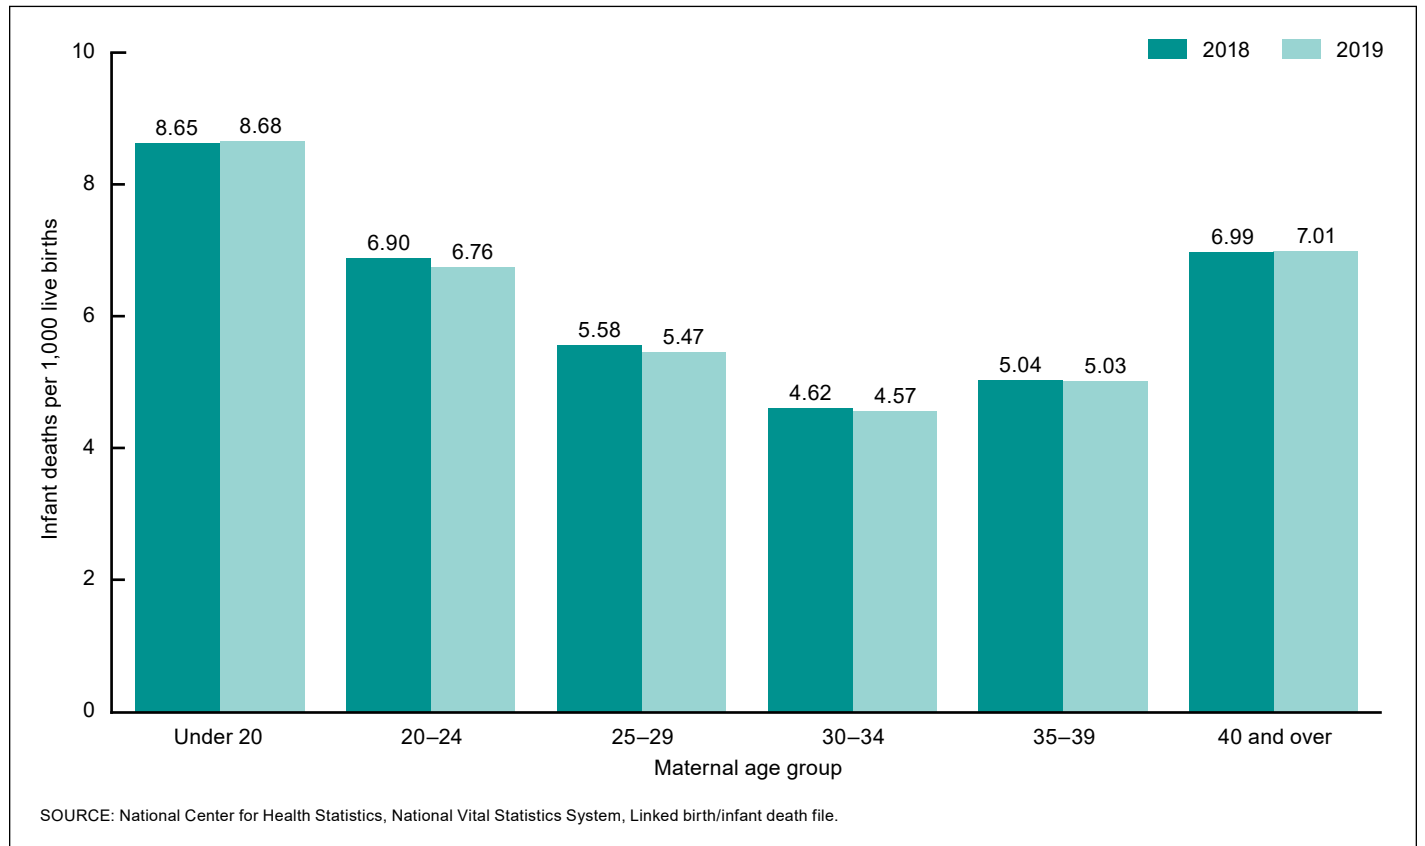

### Gestational age

- Infant mortality rates declined from 2018 to 2019 for infants born at less than 32 weeks (185.79 to 180.40 infant deaths per 1,000 births) and at 32–33 weeks (21.95 to 19.21). Infant mortality rates for all other gestational age categories did not change significantly between 2018 and 2019 (Table, Table 2) (4).
- In 2019, 66% of infant deaths occurred among infants born preterm (less than 37 weeks of gestation), unchanged from 2018.

SOURCE: National Center for Health Statistics, National Vital Statistics System, Linked birth/infant death file.

**Leading causes of infant death**

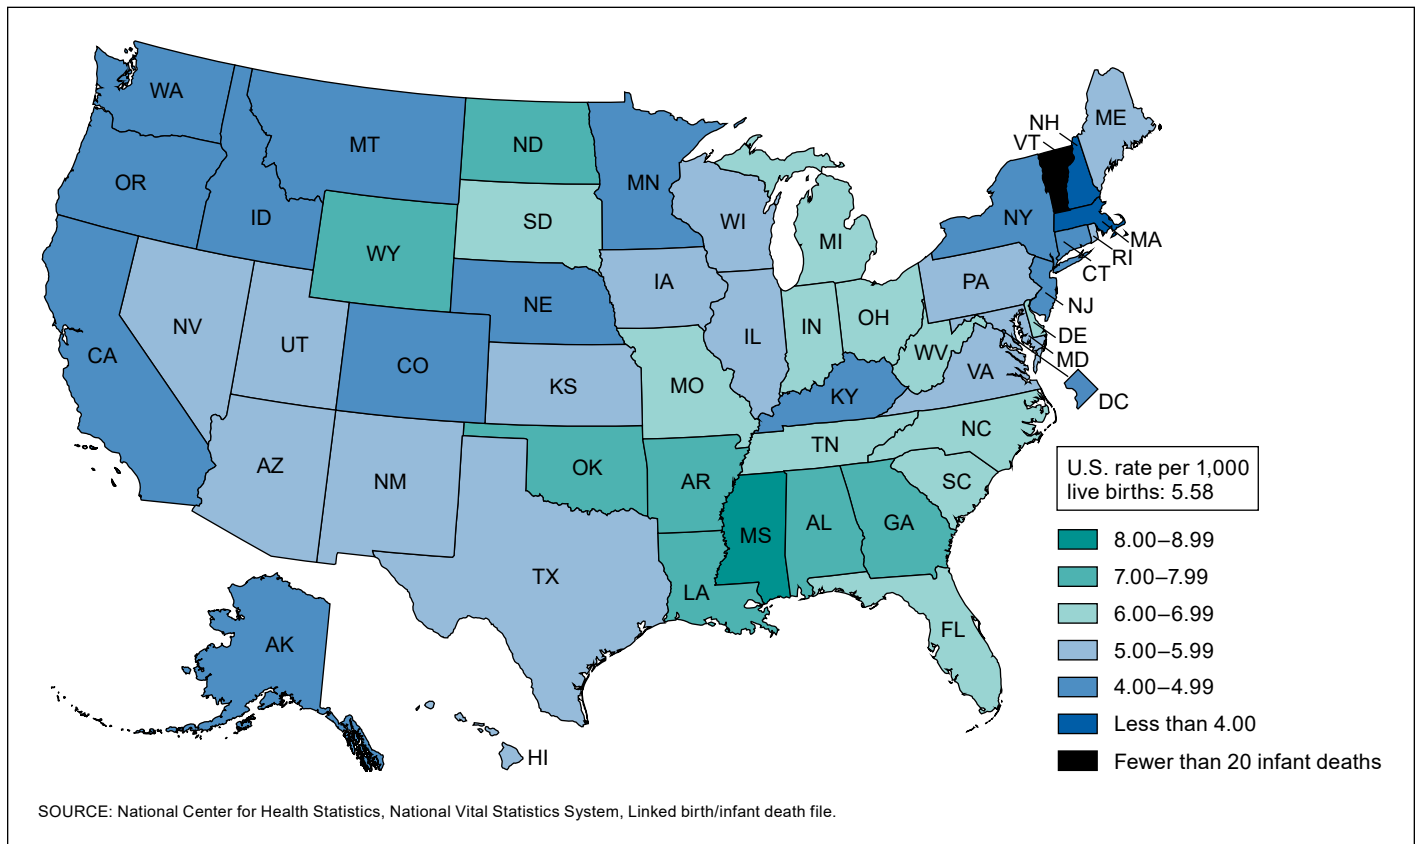

- In 2019, the five leading causes of all infant deaths were the same as those in 2018: congenital malformations (21% of infant deaths), disorders related to short gestation and low birth weight (17%), maternal complications (6%), sudden infant death syndrome (SIDS) (6%), and unintentional injuries (6%) (Table 3).
- From 2018 through 2019, infant mortality rates for unintentional injuries increased from 30.8 infant deaths per 100,000 births to 33.7, while infant mortality rates declined for disorders related to short gestation and low birth weight (97.1 to 92.3) and maternal complications (36.2 to 33.4). Declines in rates for congenital malformations (118.7 to 115.1) and SIDS (35.1 to 33.4) were not significant.

- Congenital malformations was the leading cause of death for infants born to non-Hispanic white (105.5), non-Hispanic AIAN (119.5), and Hispanic (127.5) women (Table 4).
- Disorders related to short gestation and low birth weight was the leading cause of death for infants of non-Hispanic black (237.0) and non-Hispanic Asian (75.0) women.

**Infant mortality by state**

- By state, infant mortality ranged from a low of 3.21 infant deaths per 1,000 births in New Hampshire to a high of 8.71 in Mississippi (Figure 4, Table 5).
- Twelve states had infant mortality rates significantly lower than the national infant mortality rate of 5.58: California, Colorado, Connecticut, Idaho, Kentucky, Massachusetts, Minnesota, New Hampshire, New Jersey, New York, Oregon, and Washington.

**Figure 4. Infant mortality rate, by state: United States, 2019**

- Fourteen states had infant mortality rates significantly higher than the U.S. infant mortality rate: Alabama, Arkansas, Florida, Georgia, Indiana, Louisiana, Michigan, Mississippi, North Carolina, North Dakota, Ohio, Oklahoma, South Carolina, and Tennessee.

\* Rate does not meet National Center for Health Statistics standards of reliability; based on fewer than 20 deaths in the numerator.

– Quantity zero.

<sup>1</sup>Includes Aleut and Eskimo infants.

<sup>2</sup>Includes other and unknown Hispanic origin not stated, not shown separately.

NOTES: Infant deaths are weighted, so numbers may not add to totals due to rounding. Not stated responses are included in totals but not distributed among groups for rate computations. Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with 1997 Office of Management and Budget standards. Persons of Hispanic origin may be of any race.

... Category not applicable.

\* Rate does not meet National Center for Health Statistics standards of reliability; based on fewer than 20 deaths in the numerator.

<sup>1</sup>For non-Hispanic Asian infants, Newborn affected by complications of placenta, cord and membranes (P02) was the fourth leading cause of death, with 37 deaths and a rate of 15.5. Bacterial sepsis of newborn (P36) was the fifth leading cause of death, with 30 deaths and a rate of 12.6.

<sup>2</sup>For Central and South American infants, Newborn affected by complications of placenta, cord and membranes (P02) was the fourth leading cause of death, with 27 deaths and a rate of 16.3.

NOTES: Reliable cause-specific infant mortality rates cannot be computed for Cuban or non-Hispanic Native Hawaiian or Other Pacific Islander infants because of the small number of deaths. Race and Hispanic origin are reported separately on the birth certificate. Race categories are consistent with 1997 Office of Management and Budget standards. Persons of Hispanic origin may be of any race.

\* Rate does not meet National Center for Health Statistics standards of reliability; based on fewer than 20 deaths in the numerator.

<sup>1</sup>Does not include Puerto Rico or Guam.

SOURCE: National Center for Health Statistics, National Vital Statistics System, Linked birth/infant death file.

## Technical Notes

### Data source and 2003 revision

Information on the data source for the linked birth/infant death file is available elsewhere (1). Additionally, further information on the 2003 revision of the birth certificate is available (3); see also the U.S. Standard Certificate of Live Birth (9).

### Weighting

In 2019, a record weight was added to the U.S. linked file to compensate for the 0.7% of infant death records that could not be linked to their corresponding birth certificates. The percentage of records linked varied by registration area, ranging from 96.0% through 100.0% (Table). The number of infant deaths in the linked file for the 50 states and District of Columbia (D.C.) was weighted to equal the sum of the linked plus unlinked infant deaths by state of occurrence of birth and age at death (under 7 days, 7–27 days, and 28 days to under 1 year). The addition of the weight reduced the potential for bias in comparing infant mortality rates by maternal and infant characteristics.

The 2019 linked file started with 20,968 infant death records. Of these records, 20,814 were linked; 154 were unlinked because corresponding birth certificates could not be identified. The 20,968 linked and unlinked records contained records of infants whose mothers' usual place of residence was outside of the United States; 41 records were excluded from linked file analyses for a weighted total of 20,927 infant deaths by place of residence for 2019.

### Comparison of infant mortality data between linked file and vital statistics mortality file

The overall infant mortality rate of 5.58 from the 2019 period linked file is the same as that from the 2019 vital statistics mortality file (5.58) (10). The number of infant deaths in the linked file (20,814) differs slightly from the number in the mortality file (20,921) (10). Differences in numbers of infant deaths between the two data sources are primarily due to geographic coverage differences. For the vital statistics mortality file, all deaths occurring in the 50 states and D.C. are included regardless of the place of birth of the infant. In contrast, to be included in the U.S. linked file, both the birth and death must occur in the 50 states and D.C. (the territory linked file is a separate file). Weighting of the linked file also may contribute to small differences in numbers and rates by specific variables between these two data sets.

### Period of gestation

Beginning with the 2014 data year, the National Center for Health Statistics (NCHS) transitioned to a new standard for estimating the gestational age of the newborn. The new measure—the obstetric estimate of gestation at delivery (OE)—replaces the measure based on the date of the last normal menses (11). Accordingly, gestational age data shown in this report are based on OE. National data based on OE data are available only

**Table. Percentage of infant deaths linked to corresponding birth records, by state of occurrence of death: United States and each state, 2019**

from data year 2007 forward. Information on and discussion of the reasons for the change, as well as a detailed comparison of the two measures, are presented elsewhere (11).

## Sex, birthweight, plurality, and nativity

Detailed definitions and more information on sex, birthweight, plurality, and nativity are available elsewhere (1,3).

## Cause-of-death classification

The mortality statistics presented in this report were compiled in accordance with World Health Organization (WHO) regulations, which specify that member nations classify and code causes of death according to the current revision of the *International Statistical Classification of Diseases (ICD)*. ICD provides the basic guidance to code and classify causes of death, details disease classification, and supplies definitions, tabulation lists, the format of the death certificate, and the rules for coding cause of death. Cause-of-death data presented in this report were coded by procedures outlined in annual issues of the *NCHS Instruction Manual* (12,13).

In this report, tabulations of cause-of-death statistics are based solely on the underlying cause of death. Generally, more medical information is reported on death certificates than is directly reflected in the underlying cause of death. This is captured in NCHS multiple cause-of-death statistics (14,15).

## Tabulation lists and cause-of-death ranking

The cause-of-death rankings for ICD–10 are based on the “List of 130 Selected Causes of Infant Death.” The tabulation lists and rules for ranking leading causes of death are published in the *NCHS Instruction Manual, Part 9, ICD–10 Cause-of-death Lists for Tabulating Mortality Statistics* (16).

## Computation of rates

Information on and discussion of computation of rates (1) is also available from the “User Guide to the 2010 Natality Public Use File” at: [https://ftp.cdc.gov/pub/Health\\_Statistics/NCHS/Dataset\\_Documentation/DVS/natality/UserGuide2010.pdf](https://ftp.cdc.gov/pub/Health_Statistics/NCHS/Dataset_Documentation/DVS/natality/UserGuide2010.pdf).

## Random variation in infant mortality rates

For information and discussion on random variation and significance testing for linked data (1), see also the “User Guide to the 2010 Natality Public Use File” at: [https://ftp.cdc.gov/pub/Health\\_Statistics/NCHS/Dataset\\_Documentation/DVS/natality/UserGuide2010.pdf](https://ftp.cdc.gov/pub/Health_Statistics/NCHS/Dataset_Documentation/DVS/natality/UserGuide2010.pdf).

## Availability of linked file

Linked file data are available for download from the Vital Statistics Online Data Portal: [https://www.cdc.gov/nchs/data\\_access/vitalstatsonline.htm](https://www.cdc.gov/nchs/data_access/vitalstatsonline.htm). Linked period file data may also be accessed via the Centers for Disease Control and Prevention’s Wide-ranging Online Data for Epidemiologic Research (CDC WONDER), available from: <https://wonder.cdc.gov/lbd.html>.

Beginning with 2005, the public-use file no longer includes geographic detail; such files are available upon special request (see the NCHS Division of Vital Statistics data release policy at: <https://www.cdc.gov/nchs/nvss/nvss-restricted-data.htm>). Data are also available in issues of *Vital and Health Statistics, Series 20; National Vital Statistics Reports*; and *Data Briefs*, from the NCHS website: <https://www.cdc.gov/nchs/products/index.htm>.

**Acknowledgments**

This report was prepared by the Division of Vital Statistics (DVS) under the general direction of DVS Director Steven Schwartz; Isabelle Horon, Branch Chief, Reproductive Statistics Branch (RSB); and Joyce Martin, Team Leader, RSB Birth Team. Rajesh Virkar, Chief of the Information Technology Branch (ITB), and Steve J. Steimel, Annie S. Liu, and Jasmine N. Mickens of ITB provided computer programming support and statistical tables. Steve J. Steimel and Annie S. Liu prepared the natality file; Jasmine N. Mickens prepared the linked birth/infant death data file. The Data Acquisition, Classification, and Evaluation Branch staff of DVS evaluated the quality of and acceptance procedures for the state data files on which this report is based. The National Center for Health Statistics Office of Information Services, Information Design and Publishing Staff, edited and produced this report: editor Jane Sudol, and typesetter and graphic designer Odell D. Eldridge (contractor).
