Creating an increment to a full file backup	149
Creating a cyclic partition backup	151
Merging a full partition backup with one of its differentials	153
Recovery Scenarios	156

Fixing MBR after a boot virus attack	156
Correcting BCD (Boot Configuration Data)	157
Fixing Windows startup ability	158
Restoring a hard disk from the bootable Backup Capsule	
Restoring a system partition from external media (CD/DVD)	
Restoring a system partition from a network drive	166
Restoring a system partition from a local drive	169
Restoring a dual boot Mac from an external USB drive	172
Restoring a file increment	174
Restoring a file increment to a partition backup	176
Copying of data from the corrupted system disk to another hard disk	179
Burning of data from the corrupted system disk to CD/DVD	
Copying of data from a backup to the corrupted system partition	
Restoring separate files and folders from a backup	186
Resize Scenarios	190
Creating a new partition to detach operating system from the rest of data	190
Increasing size of a system partition by taking unused space of an adjacent partition	192
Increasing size of a system partition by taking unused space from any other	194
Increasing size of a system partition by taking unused space of an adjacent logical partition	198
Merging a system partition with an adjacent logical partition	
Shrinking a system partition to increase size of a data partition	201
Resizing partitions of Apple Boot Camp	203
Creating Dual Boot Systems	205
For Windows computers	205
System Migration Scenarios	215
Migrating Windows OS to a solid state drive (Migrate OS to SSD)	215
Migrating system to a new HDD (up to 2.2TB in size)	217
Using 2.2TB+ HDD as internal data storage in Windows XP	219
Making system bootable on different hardware (P2P Adjust OS)	222
Hard Disk Optimization	229
Hard Disk Utilization	231
Extra Scenarios for WinPE	232
Adding specific drivers	232
Configuring network	233
Saving log files	235
Troubleshooter	235

Glossary

7

Introduction

Paragon Hard Disk Manager[™] 11 Server is an integrated set of powerful tools that is specially designed to tackle most of the problems you might face while using PC. Its functionality covers all aspects of a computer life cycle beginning from carrying out all the necessary partitioning operations to install the system from scratch and providing its data reliable protection to secure utilization of an outdated hard disk.

In this manual you will find the answers to many of the technical questions, which might arise while using the program.

Our company is constantly releasing new versions and updates to its software, that's why images shown in this manual may be different from what you see on your screen.

What's New in Hard Disk Manager 11

- <u>Migrate OS to SSD</u> to move any Windows OS since XP from a regular hard disk to a fast SSD (Solid State Drive) even of a smaller capacity, thanks to advanced data exclusion capabilities.
- <u>GPT Loader</u>, a special system driver to allow use of all space of modern ultra high capacity drives (larger than 2.2TB) on systems that don't support it.
- <u>The updated P2P Adjust OS Wizard</u> to successfully start up a Windows physical system on a different hardware platform (P2P) by allowing injection of all required drivers and the other actions crucial for this type of migration. Including the third generation of Paragon's Adaptive Restore[™] technology, it now can:
 - Analyze all installed drivers inside a target system to report on devices without drivers.
 - Search for and install lacking drivers from the built-in Windows repository.
 - Notify the user about boot critical devices without drivers (HDD/RAID controllers, etc.), automatically prompting to provide a path to a driver repository.
 - Name all devices according to their model description, not some alphanumeric code, which requires additional deciphering.
 - Determine and install drivers not only for boot critical devices, but for physically connected NICs as well.
- Automatic partition alignment during partitioning/copy operations to optimize performance of your hard disk.
- <u>Check FS Integrity and Data Loss Policies</u> to let you specify the acceptable balance between the operation performance and the risk of data loss.
- <u>Conversion of basic MBR disks to basic GPT</u> to enjoy all benefits of the newest partitioning scheme with minimal effort.
- <u>WinPE 3.0 based bootable environment</u> to enjoy support of a wider range of hardware configurations with the option to add drivers for specific hardware on-the-fly.
- <u>The updated Boot Corrector for WinPE</u> that now equals the functionality of the Linux/DOS counterpart.
- Backup files or entire disks to an FTP/SFTP server to provide a new level of system and data protection.
- Besides US DoD 5220.22-M and a custom wipe algorithms, there are two more available to use: Russian GOST and Paragon's.

- Better support for 64-bit platforms to reboot your computer to one of the three special modes (Windows native, Linux, or DOS) to automatically complete operations, which cannot be accomplished under 64-bit Windows.
- AFD (Advanced Format Drive) ready.
- Support of 2TB+ and non-512B sector size drives.
- USB 3.0 ready.

Product Components

In order to cope with different tasks, the product contains several components:

- <u>Windows based set of utilities</u> is the crucial part of the product. With the help of an easy to use launcher you may find and run tasks of any complexity in the field of data and system protection, hard disk partitioning and cloning, etc.
- Linux/DOS based recovery environment is a multi-platform bootable media that enables to run utilities under Linux or PTS DOS, and that way to get access to your hard disk for maintenance or recovery purposes. Both platforms have their strong sides, for instance Linux can boast support of FireWire (i.e. IEEE1394) or USB devices. It enables to burn CD/DVD discs. However there can be some difficulties with detecting new hardware. DOS in its turn has no problems of that kind but is limited in features. The Linux/DOS recovery environment requires no installation and can be of great help when the system fails to boot. Besides it offers a Windows XP like environment.
- <u>WinPE based recovery environment</u>. Especially for keen followers of Windows, our product also offers a WinPE 3.0 based bootable media. Unlike the Linux/DOS recovery environment it can boast an excellent hardware support and the same interface as the Windows version can. However its system requirements are much tougher.

Features Overview

This chapter dwells upon key benefits and technical highlights of the product.

Features

Let us list some of the features:

User Friendly Fault Minimizing Interface

- Graphical representation of the data to gain a better understanding.
- <u>A handy Launcher</u> to easily find and run the required tasks.
- Comprehensive wizards to simplify even the most complex operations.
- **Resize partitions directly on the Disk Map** with the drag-and-drop technique.
- A context sensitive hint system for all functions of the program.
- Previewing the resulting layout of hard disks before actually executing operations (so-called virtual operations).

Backup Facilities

• <u>Archive Database</u> to help the user easily manage backup images (get properties, add, delete, mount, etc.).

This feature is only available for the Windows installation of the program.

• Available location for backup images:

- Backup to local mounted partitions.
- Backup to local unmounted (without drive letter assigned) partitions.

- *Backup to an external mounted storage* to provide for a higher level of data protection and system independence.

- Backup to a special secured place on the hard disk called the Backup Capsule that has an independent system layout (e.g. a separate partition) and will stay operable should the active file system be damaged. To avoid an accidental removing or unauthorized access of the backup data, this partition is hidden and thus cannot be mounted in the operating system.

- *Backup to external media (CD/DVD)* to guarantee a high level of data protection as long as the backup media is kept secure.

- Backup to a network drive to stand a better chance of success in case of a hard disk failure.

- Backup to an FTP/SFTP server to provide a new level of system and data protection.
- <u>Smart Backup Wizard</u> to secure system and data with the minimal efforts possible. With a unique intelligent work algorithm and a highly intuitive user interface, you can easily back up exactly what you need the whole system, e-mail databases (MS Outlook, Express, Windows Mail) media files or office documents of the My Documents folder, or any other files and folders.
- <u>Differential backup</u> to a sector image to only archive changes since the last full sector-based image, thus considerably saving the backup storage space. To restore this kind of backup you will require a full image and one of its differentials.
- Incremental backup to a file image to only archive changes since the last full or incremental file-based image. An incremental image is smaller and takes less time to create, but you will require the initial full image and all of its incrementals to restore the latest point of this kind of backup.
- File backup to a sector image. It is a unique technology on the market so far that bridges two principally different approaches of the data backup: the file-based backup and the disk imaging backup. With its help you can now create a sector-based backup of your system to get it back on track in minutes in case of a virus attack or a hardware malfunction and then just make file-based incremental images to the previously created sector-based backup to keep updated only information that is critical for you. Thus you will considerably save your system resources.
- <u>Cyclic backup</u> to automate the backup of separate partitions. It is an ideal option if you want to establish a selfacting data protection system.

This feature is only available for the Windows installation of the program.

• <u>Synthetic backup</u> to change any property (merge a given differential image with its full image, split/un-split, compress/de-compress, etc.) of an existing backup image without carrying out a physical backup operation.

• <u>Bootable Backup Capsule</u> to get the choice to launch the Linux or PTS DOS recovery environment every time you start up the computer. With its help you will be able to run utilities under Linux or PTS DOS, and that way to get access to your hard disk for maintenance or recovery purposes.

This feature is only available for the Windows installation of the program.

Restore Facilities

- **Restore an entire disk, separate partitions or only files you need** from the previously created backup image.
- **Restore with Shrink** to restore a backup image to a free block of smaller size taking into account only the amount of actual data of the image.
- <u>Adaptive Restore</u> to successfully migrate a Windows physical system to a different hardware platform (P2P) by allowing automatic injection of all required drivers and the other actions crucial for a migration of this kind.

This feature is only available for the bootable recovery environment.

Copy Facilities

- Migrate OS to SSD to move any Windows OS since XP from a regular hard disk to a fast SSD (Solid State Drive) even of a smaller capacity, thanks to advanced data exclusion capabilities.
- <u>Partition/hard disk copy</u> to successfully transfer all on-disk information including standard bootstrap code and other system service structures, thus maintaining the operating system's working capability.

Copy functionality can also be used as an alternative way of data protection.

Boot Management Facilities

<u>Boot Manager Setup Wizard</u> to easily manage several operating systems on one computer.

Partition/Hard Disk Management Facilities

- <u>Basic functions for initializing, partitioning and formatting hard disks</u> (create, format, delete). Instead of the standard Windows disk tools, the program supports all popular file systems.
- **Express Create Partition Wizard** to create a new partition in the most appropriate place of a hard disk, format it to NTFS and then make it available in the system by assigning a drive letter.
- Merge Partitions Wizard to consolidate the disk space, which originally belongs to two adjacent partitions (NTFS, FAT16/FAT32), into a single, larger partition.
- <u>Redistribute Free Space Wizard</u> to increase free space on one partition by up-taking the on-disk unallocated space and the unused space of other partitions.

- <u>Express Resize Partitions Wizard</u> to increase free space on one partition by up-taking the unused space of an adjacent partition of a hard disk (including partitions of Apple Boot Camp).
- NTFS hot resize upward to enlarge an NTFS partition (system, locked) without rebooting Windows and interrupting its work.
- <u>Convert a file system</u> (FAT16/32, NTFS, Ext2/Ext3) without reformatting.
- <u>Mount a partition</u> (assign a drive letter) of any file system type to make it available for your operating system.
- Modify file system parameters (make active/inactive, hide/unhide, etc.).
- Install New OS Wizard to make a system ready to install a new operating system.
- <u>Undelete Partitions Wizard</u> to recover an accidentally deleted partition.

File System Optimization Facilities

- **<u>27 defragmentation strategies</u>** available to defragment FAT and NTFS file systems.
- MFT defragmentation and shrinking to improve performance of NTFS.
- Safe Defragmentation Mode to guarantee data loss free defragmentation of any version of NTFS and FAT.
- Low free space defragmentation (less than 1% of the free space required) to successfully defragment almost full disks.

Defragmentation is accomplished with a separate component called Paragon Total Defrag. To know more on the subject, please consult its help.

Wipe Facilities

- <u>Data wiping</u> to successfully destroy all on-disk information including the standard bootstrap code and other system service structures.
- <u>Free space clearing</u> to destroy any remnants of deleted files/directories left on disk without affecting the used data.

Automatization Facilities

• <u>Task scheduling</u> to automate routine operations. It can be particularly effective when you have to repeat a sequence of actions on a regular basis.

Scheduling is only available for the Windows installation of the program.

• <u>Scripting</u> to make the program create a script of any set of operations you need. Besides support of all operations available in the interactive mode, the unattended mode provides some additional features, such as conditional execution, subroutines, repeatable iterations, disk/partition properties analysis, errors management, etc.

Auxiliary Facilities

• <u>GPT Loader</u> is a special system driver to allow use of all space of modern ultra high capacity drives (larger than 2.2TB) on systems that don't support it.

- <u>Conversion of basic MBR disks to basic GPT</u> to enjoy all benefits of the newest partitioning scheme with minimal effort.
- <u>File Transfer Wizard</u> to make such operations as transferring of files/directories or burning of them to CD/DVD as easy and convenient as possible. Providing access to Paragon backups as regular folders, it may also help to replace corrupted data from a previously created image in case of an operating system failure.
- <u>Volume Explorer</u> is a handy tool when you have different file systems on the disk, whether they contain an operating system or just data. Volume Explorer will let you explore a file system of any type and provide access to the necessary files and directories regardless of their security attributes.
- <u>Recovery Media Builder</u> to create a bootable recovery media on a CD, DVD disc, or flash memory, which can later be used to boot and recover your computer in case of an operating system failure. Moreover, with its help you can save data from partitions of your hard disk directly to compact discs or burn ISO-images. The utility supports various formats of laser discs: CD-R/RW, DVD-R/RW, DVD+R/RW, DVD-R, DVD+R double layer, Blu-ray and can handle multi-session burning.
- <u>Network Configuration Wizard</u> to establish a network connection a bootable recovery media either to save a backup of a partition/hard disk or just several files on a network computer or retrieve a previously made backup from a network computer for recovery purposes.
- <u>Boot Corrector</u> to fix most of the system boot problems that can be a result of a human factor, program error or a boot virus activity.

Boot Corrector is only available for the bootable recovery environment.

Supported Technologies

Along with using innovative technologies from outside, Paragon has developed a number of its own original technologies that make its products unique and attractive for customers:

- **Paragon Hot Backup™** technology to back up locked partitions and hard disks under Windows NT+ family operating systems providing both high operating efficiency as well as low hardware requirements.
- **Paragon Hot Copy™** technology to copy locked partitions and hard disks under Windows NT+ family operating systems providing both high operating efficiency as well as low hardware requirements.
- **Paragon Adaptive Restore™** technology to successfully migrate a Windows physical system to a different hardware platform (P2P).
- **Paragon Power Shield™** technology to provide data consistency in case of a hardware malfunction, power outages or an operating system failure.
- **Paragon UFSD™** technology to browse partitions of any file system including hidden and unmounted, modify and copy files and folders, etc.
- **Paragon Hot Resize™** technology to enlarge NTFS partitions (system, locked) without rebooting Windows and interrupting its work.
- Paragon Restore with Shrink[™] technology to restore a backup image to a free block of smaller size taking into account only the amount of actual data of the image.
- Paragon Smart Partition[™] technology to securely perform hard disk partitioning operations of any complexity.

- **Paragon BTE™** technology to set tasks for execution during the system restart, thus saving from the need to use a bootable media when modifying system partitions.
- Microsoft Volume Shadow Copy Service (VSS) to provide the copy/backup infrastructure for the Microsoft Windows XP/Vista/7/Server 2003/2008 operating systems. It offers a reliable mechanism to create consistent point-in-time copies of data known as shadow copies. Developed by Microsoft in close cooperation with the leading copy/backup solution vendors on the market, it is based on a snapshot technology concept.
- **Microsoft Dynamic Disk** (simple, spanned, striped, mirrored, RAID-5) to offer more management flexibility without the partition limitation of basic disks. Dynamic storage can be particularly beneficial for large-scale businesses when dealing with many physical hard disks involving complex setup.
- **GUID Partition Table** (GPT). It is the next generation of a hard disk partitioning scheme developed to lift restrictions of the old MBR. GPT disks are now supported by Windows Vista/7, Server 2008, Mac OS X and Linux.

Supported File Systems

- Full read/write access to FAT16/FAT32 partitions.
- Full read/write access to NTFS (Basic Disks) under Windows, Linux and PTS DOS. Compressed NTFS files are also supported.
- Full read/write access to Ext2FS/Ext3FS/Ext4FS partitions.
- Limited read/write access to Apple HFS+ partitions.

Unfortunately, support of non-Roman characters for the HFS+ file system is unavailable at the moment. The company is about to implement it in the nearest future.

Supported Media

- Support of both MBR and GPT hard disks (2.2TB+ disks included)
- IDE, SCSI and SATA hard disks
- SSD (Solid State Drive)
- AFD (Advanced Format Drive)
- Non-512B sector size drives
- CD-R, CD-RW, DVD-R, DVD+R, DVD-RW, DVD+RW, DVD-R, DVD+R double layer and also Blu-ray discs
- FireWire (i.e. IEEE1394), USB 1.0, USB 2.0, USB 3.0 hard disks
- PC card storage devices (MBR and GPT flash memory, etc.)

Getting Started

In this chapter you will find all the information necessary to get the product ready to use.

Distribution

Paragon Hard Disk Manager 11 is distributed in two ways:

- Boxed package from Paragon Software GmbH and resellers
- Downloadable package over the Internet at the company's web-site

Distributive CD

The boxed package includes a distributive CD that is in fact a bootable recovery environment with auto-run of the Windows installation, thus it can be used as a ready-made solution. But if you're going to run the Windows components, you need to install them first (see Installation).

If you want to download an update/upgrade of the product, it will be in form of the downloadable installation package as described in <u>Online Distribution</u>).

Online Distribution

Hard Disk Manager 11 purchased over the Internet will be in form of an MSI package. After installing the product you can launch the Recovery Media Builder to prepare a recovery media.

Depending on your product and edition, you might need to additionally download an image of our WinPE recovery environment, which opens the option to prepare it on a CD/DVD/BD or a flash card before installing our software.

Registration

Paragon Software GmbH provides a wide range of online services through its web-portal - <u>www.paragon-software.com/support/</u>:

- Registration of new users;
- Registration of purchased products for registered users;
- Available around-the-clock downloading center, where registered users can get product updates/upgrades as well as all the necessary documentation;
- Downloadable free demo versions and open documentation for all users.

To register as a new user

To register as a new user, please do the following:

- 1. Run an Internet browser and visit the page: <u>www.paragon-software.com/my-account/;</u>
- 2. Click Create of the Create a Paragon Account section;
- 3. Fill out a registration form;
- 4. Click Register.

The most important field in the form is an E-mail address, as it serves as a login to enter the system. Besides your access password will be sent to this address as well.

To register a new product

If you are a registered user and would like to register Hard Disk Manager 11, please do the following:

- 1. Run an Internet browser and visit the page: <u>www.paragon-software.com/my-account/;</u>
- 2. In the Email field of the Authorization section, enter an E-mail used for registration;

- 3. In the **Password** field enter a password received after registration;
- 4. Click Sign in;
- 5. If the user name and password are valid, you will get to your account;
- 6. Click Register new product of the Products section;
- 7. Enter your product serial number in the **Serial Number** field. You can find it in the product box or obtain from your reseller. Click **Next**;
- 8. On the next page you will be asked to provide some additional data. Also you will need to decide whether you want to get confirmation on registering the product by E-mail or not. Click **Next**, and then click **Finish**.

That is all. The product is now registered.

How to Download Updates/Upgrades

Downloading of updates/upgrades can be fulfilled in the following way:

- 1. Run an Internet browser and visit the page: <u>www.paragon-software.com/my-account/;</u>
- 2. In the Email field of the Authorization section, enter an E-mail used for registration;
- 3. In the Password field enter a password received after registration;
- 4. Click Sign in;
- 5. If the user name and password are valid, you will get to your account;
- 6. Select My Downloads of the Products section to see what updates are available for you;
- 7. Select the desired update and click **Download**.

Contacting Paragon Software GmbH

If you have any questions about the company products, please do not hesitate to contact Paragon Software GmbH.

Service	Contact
Visit Paragon Software web site	www.paragon-software.com

Pre-sale information	sales@paragon-software.com

System Requirements

For the Windows installation package

- Operating systems:
 - Windows XP (32 and 64 bit)
 - Windows Server 2003 (32 and 64 bit)
 - Windows Vista (32 and 64 bit)
 - Windows Server 2008 (32 and 64 bit)

- Windows 7 (32 and 64 bit)
- Windows Server 2008 R2 (32 and 64 bit)
- Internet Explorer 5.0 or higher
- Intel Pentium CPU or its equivalent, with 300 MHz processor clock speed
- 128 MB of RAM (256+ recommended)
- Hard disk drive with 250 MB of available space
- SVGA video adapter and monitor
- Keyboard
- Mouse

During the installation additional free space (up to 1GB) will be required.

For the Linux bootable environment

- Intel Pentium CPU or its equivalent, with 300 MHz processor clock speed
- 256 MB of RAM
- SVGA video adapter and monitor
- Keyboard
- Mouse

For the WinPE bootable environment

- Intel Pentium III CPU or its equivalent, with 1000 MHz processor clock speed
- At least 512 MB of RAM
- SVGA video adapter and monitor
- Keyboard
- Mouse

Additional requirements

- Network card to send/retrieve data to/from a network computer
- Recordable CD/DVD drive to burn data to compact discs
- External USB hard drive to store data.

Installation

To install Paragon Hard Disk Manager 11, please do the following:

1. **Run Setup Application**. Click on the *.MSI file. This application will guide you through the process of the program installation. The setup utility is compiled with the InstallShield SDK, hence it contains the standard user interface and set of installation steps.

In case there is some previous version of the program installed on the computer, the program will offer the user to uninstall it first.

- 2. **Starting Setup**. The Welcome page informs that the application is being installed. Click the Next button to continue.
- 3. **Confirm License Agreement**. The License Agreement page displays the Paragon License Agreement. Read the agreement and then select the appropriate option to accept. If you do not agree with any conditions stated there, the installation process will be interrupted. By clicking the Print button, the License Agreement may also be printed out.
- 4. **Provide Registration Information**. On the Registration page you are to provide your product key and serial number.
- 5. **Provide Customer Information**. On the Customer Information page you are to provide the standard information, i.e. a user name and an organization. Besides you need to decide whether to make the program available for all users of this computer (if several) or only for the current one.
- 6. **Select an Installation Folder**. The Destination Folder page allows you to choose a folder where the program will be installed. By default, the installation folder will be created as:

C:\Program Files\Paragon\Paragon Hard Disk Manager 11. To select another folder, click the Change... button.

After you have selected the required folder, click the Next button to continue.

Do not install the program on network drives. Do not use Terminal Server sessions to install and run the program. In both cases, the program functionality will be limited.

- 7. **Confirm Installation**. On the Ready to Install the Program page click the Install button to start the installation or the Back button to return to any of the previous pages and modify the installation settings.
- 8. **Copying Files**. The Copying Files page shows the overall progress of the installation. Click the Cancel button to abort the setup.
- 9. **Finishing the Installation**. The Final page reports the end of the setup process. Click the Finish button to complete the wizard.

To accomplish online operation on locked partitions/hard disks the program uses a kernel mode hotcore driver, thus the system reboot is required to complete the installation procedure.

First Start

To start Paragon Hard Disk Manager 11 under Windows, please click the Windows Start button and then select **Programs > Paragon Hard Disk Manager™ 11 > Paragon Hard Disk Manager™**.

The program provides wide opportunities in the field of hard disk structure modification, so just to be on the safe side, please make a backup of your data before carrying out any operation.

The first component that will be displayed is called the Express Launcher. Thanks to a well thought-out categorization and hint system, it provides quick and easy access to wizards and utilities that we consider worth using on a regular basis. With its help you can also start up the traditional launcher, the help system or go to the program's home page.

To know more on how to handle the product's interface and accomplish typical operations, please consult the <u>Windows Components</u> chapter.

Building Recovery Media

Recovery Media Builder can help you accomplish the following operations:

- Prepare the Linux/DOS recovery environment (included in the installation package) on external media (CD, DVD, or flash memory) to boot and run utilities under Linux or PTS DOS, and that way to get access to your hard disk for maintenance or recovery purposes (strongly recommended);
- Prepare a custom Linux/DOS recovery environment by adding any data you like to the standard image;
- Prepare a bootable recovery environment from any ISO image, including our WinPE 3.0 image (strongly recommended);
- Create from the master CD the Linux/DOS or WinPE recovery environment on a CD/DVD disc, or flash memory.

Below you can find how to build our WinPE 3.0 based recovery environment on a thumb drive:

- 1. Plug in a thumb drive of at least 250 MBs in size. Please note all data on that drive will be deleted.
- 2. In the Main Menu: select Tools > Recovery Media Builder...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

- 3. On the Wizard's Welcome page, click the Next button.
- 4. Select the Flash Memory option.

۲	Rash Memory
	Select this option to create the recovery environment on a flash memory media. Thus you will get all recovery features available in the program on a compact, reliable, and fast device (recommended).
0	CD/DVD
	Select this option to create the recovery environment on a CD/DVD. Thus you will also get a bootable CD or DVD with all recovery features available in the program (indispensable in case your computer does not support booting from USB drives).

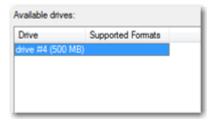

5. Select the User specified CD/DVD image (.iso file) option, then browse for an ISO image of our WinPE 3.0 recovery environment or manually type in a full path to it. By selecting the Typical option you can build our Linux/DOS recovery environment, which we highly recommend you to do as well.

Typical	
Use the standard Recovery Media image supplied with the program.	
User specified CD/DVD image (.iso file)	
Use CD/DVD image from specific location.	
E:/Downloads/Paragon/winpe20_BR10_Suite-ea-ram.iso Browse	
Copy from a CD/DVD	
Choose a source CD/DVD drive.	
	-
	Use the standard Recovery Media image supplied with the program. User specified CD/DVD image (.iso file) Use CD/DVD image from specific location. E:/Downloads/Paragon/winpe20_BR10_Suite-ea-ram.iso Copy from a CD/DVD Choose a source CD/DVD drive.

You can get an ISO image of our WinPE 3.0 recovery environment through the company's web service.

6. Select the required thumb drive from the list of flash memory devices available in the system at the moment (if several).

7. You will have to confirm the operation.

Booting from the Linux/DOS Recovery Media

The Linux/DOS recovery environment can be used to boot your computer into Linux or PTS DOS to get access to your hard disk for maintenance or recovery purposes. It also has the PTS DOS safe mode, which may help in a number of non-standard situations such as interfering hardware settings or serious problems on the hardware level. In this case, only basic files and drivers (such as hard disk drivers, a monitor driver, and a keyboard driver) will be loaded.

Startup

To start working with the Linux/DOS recovery environment, please take the following steps:

1. Start up the computer from our Linux/DOS recovery media.

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

2. Launch a boot mode you need (Normal, Safe, Low-Graphics Safe) in the Boot menu.

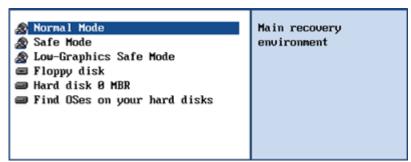

By default the Normal Mode will be automatically initiated after a 10 second idle period.

- 3. Click on the required operation to start. Hints on the selected at the moment item will help you make the right choice.
- 4. Consult the help system by pressing **ALT+F1** to know more on the subject.

Boot menu

The Boot menu contains the following commands:

- Normal Mode. Boot into the Linux normal mode. This mode uses the full set of drivers (recommended);
- **Safe Mode**. Boot into the PTS DOS mode. This mode can be used as an alternative of the Linux normal mode if it fails to work properly;
- Low-Graphics Safe Mode. Boot into the PTS DOS safe mode. In this case, only the minimal set of drivers will be included, like hard disk, monitor, and keyboard drivers. This mode has simple graphics and a simple menu;
- Floppy Disk. Reboot the computer from a system floppy disk;
- Hard Disk 0. Boot from the primary hard disk;

Find OS(s) on your hard disks. The program will scan hard disks of your computer to find any bootable operating system.

To move within the menu, please use the arrow keys of the computer keyboard.

While working with the recovery environment you might experience some inconvenience caused by possible video artifacts. It is just a result of changing video modes and in no way will affect the program functionality. If this is the case, please wait a bit and everything will be OK.

Normal Mode

When the Normal mode is selected, the Linux launch menu appears:

- Hard Disk Manager (enables to run wizards and dialogs, to specify program settings, to visualize the operating environment and the hard disk configuration);
- Simple Restore Wizard (allows restoring hard disks and partitions);
- Disk Copy Wizard (helps to clone a hard disk);
- Undelete Partition (allows recovery of accidentally deleted partitions);
- Wipe Wizard (enables to destroy all on-disk information or only remnants of deleted files/directories);
- File Transfer Wizard (allows coping files/folders to another disk or a partition as well as recording them to CD/DVD);
- Boot Corrector (helps to correct the Windows System Registry without Windows being loaded);
- Network Configurator (enables to establish a network connection under Linux);

If you are going to use network resources, first launch the Network Configuration Wizard to establish a network connection.

- Log Saver (helps to collect and send the necessary log files to the Technical Support);
- View the mounted partitions (the list of all mounted partitions will be displayed);

The Linux/DOS recovery environment assigns drive letters to partitions the way it is done in DOS, i.e. one after another, primary partitions at first. Thus mounted partitions may have different drive letters from Windows.

- Eject CD/DVD;
- Command Line (allows experienced users to execute any operation);
- Reboot the computer;
- Power off the computer.

To move within the menu, please use the arrow keys of the computer keyboard.

Safe Mode

When the Safe mode is selected, the PTS DOS launch menu appears. It has nearly the same functionality as for the Normal mode except for the **Network Configurator** and **Log Saver** commands. Besides due to certain limitations of the PTS DOS environment, there is no possibility to burn CD/DVD discs.

Low Graphics Safe Mode

When the Low Graphics mode is selected, the PTS DOS launch menu appears. It has the same functionality and looks similar to the Safe mode but graphically simpler.

🥐 Hard Disk Manager	You can create, delete and
♥ Simple Restore Wizard File Transfer Wizard Boot Corrector	format hard disk partitions using this program, which will start now.
Start the command line Reboot the computer	Upon the start, please select the drive and one of its partitions or its free space. Then activate the 'Partition' pull-down menu and select one of the partitioning operations.

Booting from the WinPE Recovery Media

The WinPE recovery environment can be a real alternative to the Linux/DOS recovery environment. Providing nearly the same level of functionality it offers an excellent hardware support and the same interface as the Windows version does.

Startup

To start working with the WinPE recovery environment, please take the following steps:

1. Start up the computer from our WinPE recovery media.

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set

up to boot from CD/USB first.

Once it has been loaded, you will see the License Agreement. Read the agreement and then mark the
appropriate checkbox to accept. If you do not agree with any conditions stated there, you won't be able to use
the program.

End User License /	greement	<u>^</u>

		-
you accept the te	rms of the agreement, click the check box be	low
	is in the License Agreement	

3. Once you accept the agreement, you will see the Universal Application Launcher. In general it enables to run components of the product, load drivers for undefined hardware or establish a network connection.

- 4. Click on the required operation to start. Hints on the selected at the moment item will help you make the right choice.
- 5. Consult the help system by pressing **ALT+F1** to know more on the subject.

Our WinPE 3.0 based recovery environment offers excellent hardware support. However in case it doesn't have a driver for your disk controller, your hard disks will be unavailable. Please consult the <u>Adding specific drivers</u> scenario to know how to tackle this issue.

Basic Concepts

This chapter explains terms and ideas that show how the program works. To understand these helps to obtain a general notion of the operation performance and makes it easier for the user to operate the program.

System and Data Protection

The data protection issue is a growing cause of worrying for more and more people today. Indeed, it is hardly to find a person who will be particularly happy when all precious information on the hard disk is irreversible lost as a result of its malfunction. So how this tragedy can be prevented?

File Backup versus Sector Backup

Since the advent of the computer age people were in the search of ways to guarantee data safety. As a result we've got now two principal approaches: the file-based backup and the sector-based backup. The main difference between the two lies in the way data is treated.

A sector-based backup operates with an image (or a snapshot) of the whole disk system or its separate partitions. It not only includes the contents of all user-made files, but additionally contains the exact structure of directories, information about file allocation, file attributes and other related data. Thus it enables to successfully process system or encrypted partitions of any file system type, no matter what kind of information they contain.

In contrast, a file-based backup takes into account a file system structure and only functions on a file or folder level. So it is very efficient when archiving separate files or folders, but in no way will help you back up a system partition.

You should understand pretty well that each of the two approaches is only good when properly chosen. In the comparison table below you can see when this or that approach will suit you at most.

Sector-Based Backup	File-Based Backup
Merits	
It does not dependent on a particular file system. Thus it can successfully process system or encrypted partitions of any file system type, no matter what kind of information they contain.	Functioning on a file/folder level, it is ideal for archiving separate files or folders.
It can create an exact image of a partition, including its service data. Thus it is ideal for a backup/restore of a system partition or a fast deployment to a bunch of identical computers.	It enables to automatically build up contents of the future backup image by using an advanced system of filters.

	It allows archiving data of the same volume with different backup policies.
	It is easy and efficient when creating backup chains.
Demerits	
Resulted backup images may contain a lot of redundant data.	It depends on a file system structure, so you won't be able to process unknown file systems.
It is ineffective when trying to maintain a backup chain, especially when little amount of data is being changed.	It cannot be used to back up a system partition.
	It is much slower when processing large amount of data.

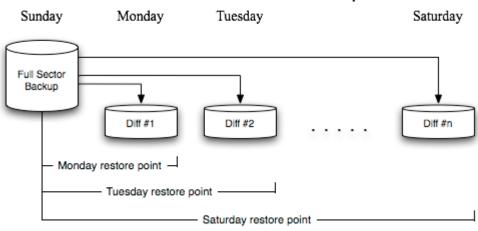

Backup Types

At the present moment the market is offering various types of backup imaging to meet the needs of any user. Besides supporting them all, our program offers a unique backup type, called File Increment to a Sector Backup.

Full and Differential Sector Backups

A full sector-based backup image includes all contents of a partition or a hard disk at the moment of its creation. If you roll back your system to the initial state on a regular basis, that's exactly what you're looking for. But if you want to have multiple backup archives of the same partition reflecting certain time stamps, unchanged data will inevitable be duplicated in all archives and take additional space on backup media. To tackle this issue there has been developed a supplementary technique called Differential Sector Backup.

A differential archive only contains data changed since the time of creating a full archive, which forms a base (or a parental image) in this case, thus considerably saving your system resources. It is realized by the exact bit-wise comparison of the previous partition's data (saved in the parental image) with the current data (that is actually the partition itself). To restore this kind of backup you will require a full image and one of its differentials, what is very convenient.

Differential Base to a Sector Backup

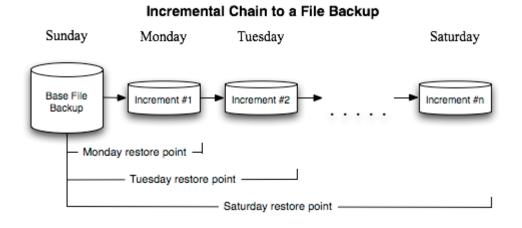

This function is only available for single primary and logical partitions.

Full and Incremental File Backups

A full file-based archive only contains files and folders. It is really efficient when backing up an e-mail database or particular documents, as no redundant data is processed. But if you care about maintaining a files history, you can benefit from one more supplementary technique called Incremental File Backup.

An incremental archive only contains data changed since the time of creating a full or incremental file-based archive. It is smaller and takes less time to create, but you will require the initial full image and all of its increments to restore the latest point of this kind of backup.

File Increment to a Sector Backup

File Increment to a Sector Backup is a unique technology on the market so far that bridges two principally different approaches of the data backup: the file-based backup and the sector-based backup. With its help you can now create a sector-based backup of your system to get it back on track in minutes in case of a virus attack or a hardware malfunction and then just make file-based incremental images to the previously created sector-based backup to keep updated only information that is critical for you. Thus you will considerably save your system resources.

Backup Storage

Our program supports several techniques of storing backup images. Let's take a closer look at them all to understand what kind of storage is able to provide better security:

- You can place a backup image to a local partition. Despite the fact that it is the most convenient way, try not to
 use it. You can delete your backup just by accident or lose it as a result of a hardware malfunction, or a virus
 attack;
- You can place a backup image to an external mounted storage to provide for a higher level of data protection and system independence;
- You can place a backup image to a special secured place on the hard disk called the Backup Capsule that has an independent system layout (e.g. a separate partition) and will stay operable should the active file system be damaged. To avoid an accidental removing or unauthorized access of the backup data, this partition is hidden and thus cannot be mounted in the operating system. However it won't help you in case of a hardware malfunction;

- You can place a backup image to external media (CD/DVD) to guarantee a high level of data protection as long as the backup media is kept secure;
- You can place a backup image to a network drive to stand a better chance of success in case of a hard disk failure. Moreover, by storing it on a special-purpose server you may be pretty sure nothing will happen to it;
- Finally you can place a backup image to an FTP server to provide a new level of system and data protection.

Known Issues on FTP/SFTP

- 1. You need to check out yourself Windows Firewall or programs of this kind let our program work with the required port (21 by default).
- 2. You cannot restore data selectively (with Restore Wizard) from an FTP/SFTP server.
- 3. You can browse an FTP server in the passive mode only.
- 4. Parallel access to several FTP/SFTP servers is limited only one password for all servers is available.

Adaptive Restore

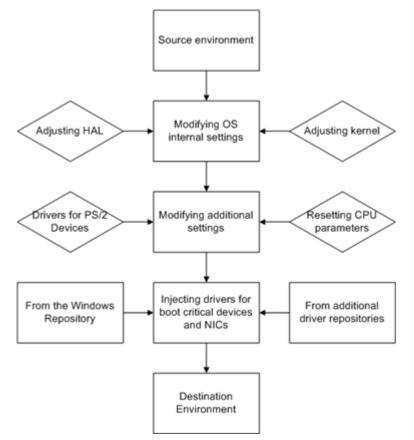

Technology Background

Windows family operating systems are notorious for their excessive sensibility to hardware, especially when it turns to replacement of such a crucial device as HDD controller or motherboard – actually Windows will most likely fail to boot as a result of this operation.

In 2008 our company came with an exclusive technology called Paragon Adaptive Restore[™]. Initially aimed at restore of Windows Vista or Server 2008 from a backup to a different hardware configuration, its current realization, available in the P2P Adjust OS Wizard, enables to make any Windows OS since XP bootable on dissimilar hardware by allowing automatic injection of all required drivers and the other actions crucial for this type of migration.

Technology Concept

Let's take a closer look at how Paragon Adaptive Restore works.

As you see, successful migration of a Windows system to a different hardware platform involves several actions:

- 1. Change of the Windows kernel settings according to the new configuration. The program detects the given hardware profile and automatically installs the appropriate Windows HAL and kernel.
- 2. Installation of drivers for boot critical devices. The program detects those without drivers and automatically tries to install lacking drivers from the built-in Windows repository. If there's no driver in the repository, it prompts the user to set a path to an additional driver repository, strongly recommending not to proceed until all drivers for the found boot critical devices are installed. In case drivers for these devices are installed, but disabled, they will be enabled.
- 3. Installation of drivers for a PS/2 mouse and keyboard. This action will only be accomplished for Windows XP/Server 2003.
- 4. **Installation of drivers for network cards**. The program detects those without drivers and automatically tries to install lacking drivers from the built-in Windows repository. If there's no driver in the repository, it prompts the user to set a path to an additional driver repository.

These actions guarantee a Windows system will start up on dissimilar hardware. After the startup, Windows will initiate reconfiguration of all Plug'n'Play devices. It's a standard procedure, so please don't worry and prepare the latest drivers at this step to get the most out of the system.

Though all Windows systems have built-in driver repositories, please be prepared to have additional drivers when dealing with Windows XP/Server 2003, because for these systems they are very modest.

Technology Application

Let's consider a number of situations when the Adaptive Restore technology can help you out: Copyright© 1994-2011 Paragon Software Group. All rights reserved.

- If you need to migrate to a different hardware platform with minimal effort
- If you need to upgrade hardware while keeping all programs and settings intact
- If you need to replace failed hardware and cannot find an exact match for original system specifications

Known Issues

- 1. After transferring Microsoft Vista and later versions to different hardware, you will need to re-activate license of the system. It's normal behavior as these systems keep tracking any change of hardware. Re-activation is legally justified in this case, as you transfer your system to another PC.
- 2. If you've installed several operating systems on one partition, we can only add drivers to the latest version of OS. Microsoft highly recommends that you install an operating system on a separate partition.
- 3. Please note drivers are not cached during selection. That's why if you select a driver to add to the system, but it's already unavailable during the operation, the program will end the operation with an error.

Paragon Hot Processing & Volume Shadow Copy Service

Offline versus Online Data Processing

In the course of time there have been developed various methods of data processing. Despite different work concept, all of them can be divided into two principal groups: offline (cold) and online (hot) data processing techniques.

As the name infers, offline data processing can only be accomplished when the data is in consistent state (the operating system and all the applications are completely shut down). Actually it is the most preferable way of image creation or data cloning, since software can obtain an exclusive right to process data that guaranties high level of operating efficiency. However, the offline data processing is absolutely out of question when dealing with 24/7 production environments.

In contrast, online data processing enables to create a consistent snapshot even as the data is currently modified. It is particularly useful for systems with high availability requirements, but it won't be accomplished until all active transactions are complete. The point is to provide a coherent state of all open files and databases involved in a process, taking into account that applications may still keep writing to disks. As a result an online data processing cannot boast high operating speed.

Our program supports both offline and online methods of data processing. As far as online method is concerned it offers its own hot processing algorithm together with the possibility to use snapshot technologies provided by the Microsoft VSS framework.

Paragon Hot Processing Technology

Paragon Hot Processing is an online copy/backup technology for Windows NT+ family operating systems. Developed back in 2001, nowadays it is integrated with all copy/backup solutions offered by the company.

Paragon Hot Processing is not exactly a snapshot technology, though it has much in common with it. During an online copy/backup, the program uses the kernel mode driver HOTCORE.SYS to intercept and control disk write activity of applications and the operating system. The hotcore driver as an integral part of the program is installed during the setup procedure (that's why the system reboot is required to complete the setup procedure). For the most part the driver is in the idle mode until it is activated with the program. While in this mode it bypasses any calls having no effect on the overall system performance, but a few kilobytes of the system memory.

Paragon Hot Processing technology offers copy/backup of locked partitions and hard disks under Windows NT+ family operating systems providing both high operating efficiency as well as low hardware requirements.

It is not recommended to use Paragon Hot Processing with active SQL Server, Exchange or Oracle databases since the backup image contents may be corrupted.

Volume Shadow Copy Service

Microsoft Volume Shadow Copy Service (VSS) is designed to provide the copy/backup infrastructure for the Microsoft Windows XP/Vista/Server 2003/2008 operating systems. It offers a reliable mechanism to create consistent point-in-time copies of data known as shadow copies. Developed by Microsoft in close cooperation with the leading copy/backup solution vendors on the market, it is based on a snapshot technology concept.

Initiated by a VSS aware copy/backup utility, VSS creates snapshots for the selected volumes and represents them as virtual read-only devices, called volume shadow copies. Once the shadow copies are created, the copy/backup utility starts processing the data while applications keep writing to original volumes.

Unlike Paragon Hot Processing the VSS technology provides a unique possibility to make a synchronous snapshot of multiple volumes. This very feature can be particularly beneficial when backing up active SQL Server 2003, Exchange 2003 or Oracle databases located on multiple volumes the way it is recommended by Microsoft to improve the level of database performance and reliability, thus providing 100-percent data consistency.

To use VSS it is necessary to have a mounted 300 MB+ NTFS partition.

Dynamic Disks

As you probably know, MS-DOS, Microsoft Windows 95/98/Me/NT/2000/XP/Vista/Server 2003/2008 support four primary partitions per physical hard disk, one of which can be extended. Certainly there is the possibility to create logical drives within the extended partition. Such types of disks are called basic. Windows XP Professional, Windows 2000, Windows Vista and Windows Server 2003/2008 follow the same strategy: You can have a maximum of four primary partitions, one of which can be an extended partition with logical drives. However, these operating systems also introduce a new disk configuration type - dynamic disk - which must be understood to effectively configure and manage hard disks.

Dynamic disk is a physical disk that doesn't use partitions or logical drives. Instead, it contains only dynamic volumes. Regardless of what format you use for the file system, only Win2K computers can access dynamic volumes directly. However, computers that aren't running Win2K can access the dynamic volumes remotely when connected to the shared folders over the network.

Dynamic disks can co-exist on a system with basic disks. The only limitation is that you cannot mix Basic and Dynamic disks on the same hard drive.

There are five types of dynamic volumes: simple (uses free space from a single disk), spanned (created from free disk space that is linked together from multiple disks), striped (a volume the data of which is interleaved across two or more physical disks), mirrored (a fault-tolerant volume the data of which is duplicated on two physical disks, and RAID-5 volumes (a fault-tolerant volume the data of which is striped across an array of three or more disks).

With dynamic storage, you can perform disk and volume management without the need to restart Windows.

Limitations:

• Dynamic disks are not supported on portable computers.

- Dynamic disks are not supported on Windows XP Home Edition-based computers.
- You cannot create mirrored volumes or RAID-5 volumes on Windows XP Home Edition, Windows XP Professional, or Windows XP 64-Bit Edition-based computers.

Thus, the dynamic disk is a new way of looking at hard disk configuration. Dynamic disks offer you more management flexibility without the partition limitation of basic disks. Dynamic disks can contain an unlimited number of volumes, but they cannot contain partitions or logical drives. Dynamic storage can be particularly beneficial for large-scale businesses when dealing with many physical hard disks involving complex setup.

GPT versus MBR

GUID Partition Table (GPT) is the next generation of a hard disk partitioning scheme developed to lift restrictions of the old MBR. Being a part of the Extensible Firmware Interface (EFI) standard proposed by Intel to replace the outdated PC BIOS, it offers a number of crucial benefits:

- Up to 128 primary partitions for the Windows implementation (only 4 in MBR);
- The maximum allowed partition size is 18 exabytes (only 2 terabytes in MBR);
- More reliable thanks to replication and cyclic redundancy check (CRC) protection of the partition table;
- A well defined and fully self-identifying partition format (data critical to the platform operation is located in partitions, but not in un-partitioned or hidden sectors as this is the case with MBR)

Apple Boot Camp

Boot Camp is a special utility to help you set up a dual boot system (Mac OS X and 32-bit Windows XP/Vista) on Intelbased Macs. It enables to securely re-partition your hard disk (resize an existing HFS+ partition to create a separate partition for Windows) and then launch the installation process. With Boot Camp all the necessary drivers will be at your disposal. Moreover after Windows has been installed it will serve as a boot manager to choose what operating system to start up.

It is strongly recommended not to modify the hard disk configuration with Windows Disk Manager. Otherwise it may lead to unexpected consequences, right up to BSOD and inability to boot in Windows XP/Vista. Please use our program to correctly update both MBR and GPT.

64-bit Support

The bulk of software today is written for a 32-bit processor. It can meet the requirements of almost any end user. However that is not the case when dealing with servers processing large amounts of data with complex calculations of very large numbers. That is where 64-bit architecture comes into play.

It can boast improved scalability for business applications that enables to support more customer databases and more simultaneous users on each server. Besides a 64-bit kernel can access more system resources, such as memory allocation per user. A 64-bit processor can handle over 4 billion times more memory addresses than a 32-bit processor. With these resources, even a very large database can be cached in memory.

Although many business applications run without problems on 32-bit systems, others have grown so complex that they use up the 4 GB memory limitation of a 32-bit address space. With this large amount of data, fewer memory resources are available to meet memory needs. On a 64-bit server, most queries are able to perform in the buffers available to the database.

Some 32-bit applications make the transition to the 64-bit environment seamlessly others do not. For instance, systemlevel utilities and programs that provide direct hardware access are likely to fail. Our program offers a full-fledged support of the 64-bit architecture providing fault-tolerant work for such system dependent modules as Hot Processing.

Copy Operations

Hard drive duplication nowadays is becoming highly popular among PC users. That is due to some definite advantages it can offer. First of all, many people clone hard disks just to back up data for security reasons. The present day copy utilities enable to successfully transfer all on-disk information including standard bootstrap code and other system service structures, thus maintaining the operating system's working capability. In case of a system malfunction, the user can get the system back on track in minutes. No additional configuration is required, what is very convenient.

The second possible application is the upgrade of a hard disk to a new one. The capacity of a modern hard drive doubles every two years, thus opening up new possibilities for software developers. As a result programs become more complicated and require considerable amount of free space. One day the user realizes that there is no more free space left on the hard disk and the only way out is to upgrade. Usually that means that besides purchasing a new hard disk, the user is to face a large re-installation procedure spanning several days of tedious work. But all of this can be avoided just by copying the contents of the old hard disk to a new one proportionally resizing the partitions.

And the last but not least is the copying of hard disks for cloning purposes. It may be of great use when setting up similar computers. There is no need for a system administrator to install an operating system from scratch on every one of them. It is enough just to configure one and then clone it to the others.

Drive Partitioning

As you probably know a hard drive is to be split into one or more partitions, since it cannot hold data until it is carved up and space is set aside for an operating system. Until recently most PCs used to have just one partition, which filled the entire hard disk and contained an OS. The situation has changed however, thanks to new cost-effective high capacity hard drives, thus opening up numerous possibilities for PC users, such as editing video, archiving music, backing up CD images, etc. Huge increase in space is great, but it poses a number of problems, most important of which are effective data organization and speed.

Large drives are always going to take longer to search than smaller volumes, and an operating system is going to have its work cut out both finding and organizing files. It is for this reason that many people decide to invest in multiple hard drives, but there is an easy solution – drive partitioning. Partitioning lets you divide a single physical drive into a number of logical drives, each of which servers as a container with its own drive letter and volume label, thus enabling the operating system to process data more efficiently. Besides partitioning makes it possible to organize data so that it is easy to find and manage. You can set aside, for instance, 40 GB of a 160 GB hard drive for the OS, 70 GB for storing video and another 50 GB for your favorite music collections to provide transparent data storage.

It is also worth mentioning to that with a hard drive properly partitioned, such routine operations as files defragmentation or consistency check will not be that annoying and time-consuming any more.

By detaching the OS from the rest of the data you can tackle one more crucial issue – in case of a system malfunction, you can get the system back on track in minutes by recovering it from a backup image located on the other partition of the hard drive.

But that is not all drive partitioning may be used for. If you are willing to play games in Windows while browsing the Internet in Linux, 100-percent sure that no virus will attack your PC, drive partitioning is a necessity. In order to run several OSs on a single hard drive you are to create a corresponding number of partitions to effectively delineate the boundaries of each OS.

Data Sanitization

Data security is a two-sided problem. It is to be made clear, that providing confidentiality implies not only information to be stored properly, but also be destroyed according to certain rules. The first step to protecting yourself is to know exactly which security precautions work and which do not.

Many people believe the misconception that repartitioning a disk will result in complete destruction of its contents. Actually that is not quite so. Repartitioning the drive only alters references to partitions in the Partition Table, leaving all file data intact. In fact, there are a number of programs available to successfully recover previously deleted partitions.

Formatting a drive also does not guarantee data destruction. Formatting procedure implies modification of the Master File Table (MFT) that keeps track of where file contents are stored on the disk and verification of each sector for consistency. Even a low-level format does not actually erase the file contents for good, since they can still be resurrected from their deleted state with minimal effort by using the popular today Magnetic Force Microscopy technology.

The only way to make sure that all the data has been erased from a hard drive is to overwrite all on-disk sectors with random patterns of ones and zeros. Although this sounds complex, there is an easy way to do this.

The process of deliberately, irreversibly removing or destroying the data stored on a memory device (magnetic disks, flash memory drives, etc.) is generally known as Data Sanitization. A device that has been sanitized has no usable residual data and even advanced forensic tools should not ever be able to recover it, thus providing maximum level of security.

Data Security Standards

To irreversibly destroy all on-disk information there have been developed a number of disk sanitizing standards. They are distinguished by wiping patterns and number of passes:

- 1. **US DoD 5220.22-M**. US Department of Defense recommends to overwrite all addressable locations with a character, its complement and then a random character. Finally, the target data area is to be verified;
- 2. US Navy standards NAVSO P-5239-26.
 - NAVSO P-5239-26 for RLL encoded drives. At first to write the fixed value (0xffffffff) to the target data area, then the fixed value (0x27fffff), and then random values. Finally, the target data area is to be verified;
 - NAVSO P-5239-26 for MFM encoded drives. At first to write the fixed value (0xffffffff) to the target data area, then the fixed value (0xbfffffff), and then random values. Finally, the target data area is to be verified;
- 3. British HMG Infosec Standard No.5. At first to write a single character pattern, then its complement and then a random character. Finally, the target data area is to be verified;
- 4. **German VSItR Standard**. Overwrite the deleted information 7 times, consistently filling it with the following patterns: 0x00, 0xFF, 0x00, 0xFF, 0x00, 0xFF, 0xAA. Finally, the target data area is to be verified;
- 5. Australian ASCI 33. Overwrite with a character (C), then verify. Overwrite with –C (the first pass character's inverse), then verify again. Overwrite everything with both C and –C once again but without verification. Fill everything with random characters;
- 6. **Russian GOST R 50739-95**. Destroy information by a single pass with writing random characters into each sector byte;

- 7. **Peter Gutmann's algorithm**. A whopping 35 passes, with 27 random-order passes using specific patterns combined with eight passes using random patterns;
- 8. **Bruce Schneier's algorithm**. Two passes of specific patterns followed by five passes using a cryptographically secure pseudo-random sequence;

9. Paragon's algorithm.

- Overwrite each sector with a forcefully randomized 512-byte string, new for each sector, using CSPRNG (cryptographically secure pseudo-random number generator);
- Overwrite each erased sector with its complement;
- Overwrite each sector with a 512-byte string (CSPRNG), again forcefully randomized and different from the first pass, and new for each sector;
- Fill each erased sector with 0xAA value. Finally, the target data area is to be verified.

Military and government standards always require 100 percent residual data verification. It is necessary to make sure that the operation has been properly accomplished. Besides corrupted sectors discovered during the operation are to be logged to keep the user informed, since these sectors may contain classified information.

The list of supported military and government standards may vary for your product. Anyway you've always got the possibility to create a customized algorithm, defining up to 4 wiping patterns, number of passes for each wiping pattern and for the group of patterns, thus providing the maximum possible security level.

Scheduling

The automation of operations is particularly effective when you have to repeat a sequence of actions on a regular basis. For example, developing a specific project on a day-to-day basis and having to make a backup every evening so as not to lose the valuable data, you will really appreciate, when this kind of routine operations will be carried out automatically without your participation.

Another aspect of any automation process is that it allows an optimization of your computer's work-load. This is especially important when operations require a considerable amount of computer resources – processor time, memory and more. A number of tasks, which can decrease the performance, can be run during the night or whenever the computer has the least work-load to perform.

The program has a special tool for scheduling. You can set out a timetable for any operation and it will start at a specified time without interrupting your current activity.

Windows Components

In the given section you can find all the information necessary to successfully work with the Windows version of the product.

Interface Overview

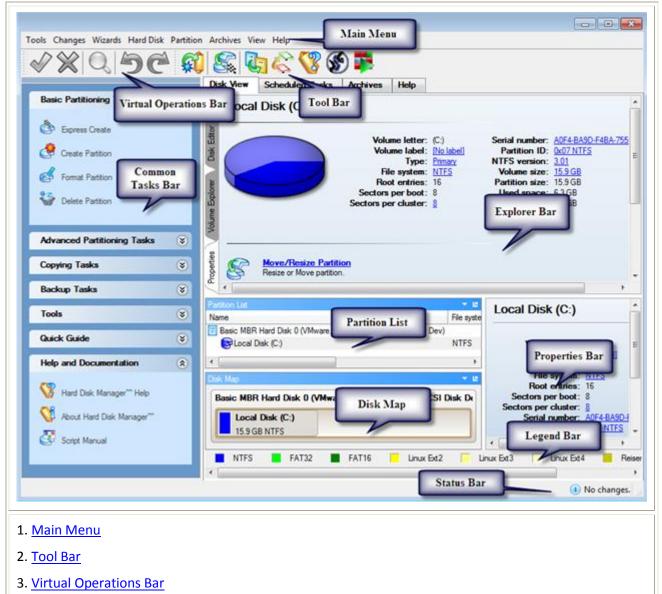

This chapter introduces the graphical interface of the program. The design of the interface precludes any mistake being made on the part of the user. Most operations are performed through the system of wizards. Buttons and menus are

accompanied by easy understandable icons. Nevertheless, any problems that might occur while managing the program can be tackled by reading this very chapter.

General Layout

When you start the program, the first component that is displayed is called the Launcher. It enables to run wizards and dialogs, to specify program settings, to visualize the operating environment and the hard disk configuration.

The Launcher's window can be conditionally subdivided into several sections that differ in their purpose and functionality:

- 4. <u>Common Tasks Bar</u>
- 5. Explorer Bar
- 6. Disk Map
- 7. Partition List
- 8. Properties Bar
- 9. Legend Bar
- 10. Status Bar

A number of panels offer similar functionality with a synchronized layout. The program enables to conceal some of them to simplify the interface management.

All panels are separated by vertical and horizontal expandable sliders, allowing the user to customize the screen layout.

Main Menu

The Main Menu provides access to the entire functionality of the program. The available functions are as listed below:

MENU ITEM	FUNCTIONALITY
Tools	
View Log Files	View logs on the carried out operations
Send Log Files	Compress and send the log to the Paragon Support Team
Setup Boot Manager	Manage several operating systems on one computer
Recovery Media Builder	Restore the system even when the current operating system cannot boot anymore
Check Recovery Discs	Verify the recovery media for integrity and ability to boot from
File Transfer Wizard	Transfer data from any media
Settings	Edit the general settings of the program
Exit	Exit the program
Changes	
Generate Script	Generate a script for the task
Save to Scheduler	Schedule pending operations
Undo `the last virtual operation`	Cancel the last virtual operation on the List of Pending Operations
Redo `the last virtual operation`	Cancel the last undo virtual operation on the List of Pending Operations
View Changes	Display the List of Pending Operations
Apply Changes	Launch the real execution of virtual operations
Discard All Changes	Cancel all virtual operations on the List of Pending Operations
Reload Disk Info	Refresh the current information about disks
Wizards	
Express Create Partition	Create an NTFS partition and make it ready for work
Create Partition	Create a partition of any file system
Format Partition	Format a partition of any file system

Delete Partition	Delete a partition of any file system
Total Defrag	Launch Total Defrag to optimize NTFS and FAT file systems
Wipe Hard Disk or Partition	Destroy all on-disk information or only remnants of deleted files/directories
Express Resize Partitions	Increase free space on one partition by up-taking the unused space of an adjacent partition
Undelete Partitions	Recover an accidentally deleted partition
Merge Partitions	Merge adjacent partitions of NTFS, FAT or FAT32 file systems
Redistribute Free Space	Redistribute available disk space of existed partitions
Install New OS	Make your system ready to install a new operating system
Smart Backup	Back up exactly what you need - the whole system, e-mail databases (MS Outlook, Express, Windows Mail) media files or office documents of the My Documents folder, or any other files and folders
Differential Backup	Create a differential to a partition backup
Create a File Complement	Create an increment to a full partition backup
Create a File Increment	Create an increment to a file backup
Restore	Restore an entire hard disk, separate partitions, or files from the backup image
Manage Backup Capsule	Create and manage the backup capsule
Check Archive Integrity	Perform integrity check for the required backup image
<u>Cyclic Backup</u>	Automate a partition backup
Synthetic Backup	Change any property of an existing archive (splitting, password protection, compression level, etc.) without accomplishing the backup operation
Migrate OS	Move any Windows OS since XP from a regular hard disk to a fast SSD
Copy Hard Disk	Create a hard disk copy
Schedule Hard Disk Copy	Set a timetable for a hard disk copy
Copy Partition	Create a partition copy
Schedule Partition Copy	Set a timetable for a partition copy
Hard Disk	
Back Up Hard Disk	Create a backup archive of the selected hard disk
Burn Hard Disk to CD or DVD	Back up the selected hard disk and burn the resulted image to CD/DVD

Restore Hard Disk	Restore the selected hard disk from a backup image
Convert to Basic	Convert a dynamic MBR disk containing simple volume(s) into a basic MBR disk
<u>Convert to Basic MBR hard</u> <u>disk</u>	Convert a basic or a dynamic GPT disk containing simple volume(s) into a basic MBR disk
Convert to GPT hard disk	Convert a basic MBR disk into a basic GPT disk
Update MBR	Update MBR (Master Boot Record) of the selected hard disk
Change Primary Slots	Modify the primary partitions enumeration for the selected hard disk
Wipe Hard Disk	Irreversibly destroy all on-disk information
Edit/View Sectors	View/edit sectors of the selected hard disk
Properties	Get in-depth information on the properties of selected hard disk
Partition	
Create Partition	Create a partition
Format Partition	Format a partition
Delete Partition	Delete a partition
Back Up Partition	Create a backup archive of the selected partition
Burn Partition to CD or DVD	Back up the selected partition and burn the resulted image to CD/DVD
Restore Partition	Restore the selected partition from a backup image
Move/Resize	Move/Resize the selected partition
Convert File System	Convert file system of the selected partition
Assign Drive Letter	Assign drive letter to the selected partition
<u>Remove Drive Letter</u>	Remove drive letter for the selected partition
Hide Partition	Make the selected partition unavailable for the operating system
Unhide Partition	Make the selected partition available for the operating system
Mark Partition as Active	Make the selected partition bootable by default
Mark Partition as Inactive	Make the selected partition non-bootable by default
Change Volume Label	Change volume label of the selected partition
Change Cluster Size	Change cluster size of the selected partition
Change Serial Number	Change serial number of the selected partition
•	

Downgrade NTFS version	Decrease version of the selected NTFS partition
Change Partition ID	Change identifier of the selected partition
Make Partition Primary	Make the selected partition Primary
Make Partition Logical	Make the selected partition Logical
Wipe Partition	Irreversibly destroy all on-partition information
Clear Free Space	Destroy any remnants of deleted files/directories left on disk
Test Surface	Test surface of the selected partition/block of free space
<u>Check File System</u> <u>Integrity</u>	Check the selected partition for possible file system errors
Edit/View Sectors	View/edit sectors of the selected partition
Properties	Get in-depth information on the properties of selected partition
View	
Layouts	Manage the Launcher layout with several predefined profiles
Toolbar	Manage the Tool Bar representation: show / hide standard and navigation buttons, text labels and large icons
Status Bar	Display the Status Bar
Common Tasks Bar	Display the Common Tasks Bar
Disk Map Legend	Display the Disk Map legend
Properties and Commands	Display the Explorer Bar
Disk Map Location	Select whether the Disk Map will be located on the top of the main window or at the bottom
Help	
Help	Open the Help system (you can also do it by pressing F1)
About	Open the dialog with information about the program

The Main Menu contents available at the moment may vary depending on the selected object.

Tool Bar

The Toolbar provides fast access to the most frequently used operations:

BUTTON FUNCTIONALITY

F	Back up exactly what you need with Smart Backup Wizard
S.	Increase free space on one partition by up-taking the unused space of an adjacent partition
U	Copy a hard disk
\$	Migrate OS to SSD
-	Defragment the selected partition
۲	Switch to Express launcher
	Open the Help system

Virtual Operations Bar

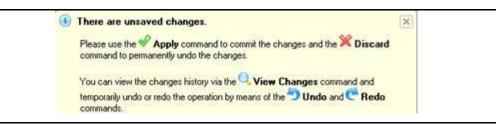

The program supports previewing the resulting layout of hard disks before actually executing operations (so-called virtual mode of execution). In fact, when the virtual mode is enabled, the program does not accomplish operations immediately, but places them on the List of Pending Operations for later execution.

The Virtual Operations Bar enables to manage pending operations.

BUTTON	FUNCTIONALITY
5	Cancel the last virtual operation on the List of Pending Operations
Ć	Cancel the last undo virtual operation on the List of Pending Operations
Q	Display the List of Pending Operations
V	Launch the real execution of virtual operations
×	Cancel all virtual operations on the List of Pending Operations

Virtual mode is an effective way of protection from any troubles, since no operations will be executed until clicking the Apply button for confirmation, thus giving a second chance to weigh all pros and cons of this or that particular operation. The program politely reminds the user that there are unsaved changes by showing the following window:

Common Tasks Bar

The Common Tasks Bar is located on the left side of the main window. It is intended for easy access to the program's wizards.

The bar contains several tabs. Each tab includes a separate button bar which can be folded by clicking it.

Basic Partitioning Tasks	
🖄 Express Create	Starting the Express Create Partition Wizard to create an NTFS partition and make it ready for work.
Create Partition	Starting the Create Partition Wizard to create a partition of any file system.
Format Partition	Starting the Format Partition Wizard to format an existing partition to one of the file systems supported by the program.
Delete Partition	Starting the Delete Partition Wizard to delete a partition of any file system.
Advanced Partitioning Tasks	
Total Defrag	Starting Total Defrag to optimize NTFS and FAT file systems.
Express Resize	Starting the Express Resize Partitions Wizard to redistribute free space between two adjacent partitions.
Generative Merge Partitions	Starting the Merge Partitions Wizard to merge adjacent partitions of NTFS, FAT, FAT32 file systems.
Redistribute Free Space	Starting the Redistribute Free Space Wizard to redistribute available disk space of existing partitions.
Undelete Partitions	Starting the Undelete Partitions Wizard to recover accidentally deleted partitions.
Copying Tasks	
🞸 Migrate OS	Starting the Migrate OS to SSD Wizard to migrate Windows OS to a fast SSD.
Copy Disk	Starting the Copy Hard Disk Wizard to copy a hard disk.
Copy Partition	Starting the Copy Partition Wizard to copy a partition.

Backup Tasks	
Smart Backup	Starting the Smart Backup Wizard to back up exactly what you need - the whole system, e-mail databases (MS Outlook, Express, Windows Mail) media files or office documents of the My Documents folder, or any other files and folders.
Manage Backup Capsule	Starting the Manage Backup Capsule Wizard to create, resize or delete the backup capsule.
🕼 Restore	Starting the Restore Wizard to restore a hard disk, separate partition, or files from the backup image.
Tools	
File Transfer Wizard	Starting the File Transfer Wizard to transfer data from any media. Besides it provides access to Paragon backups as regular folders to browse through their contents or copy required files.
🔊 Boot Manager Wizard	Starting the Boot Manager Setup Wizard to easily manage several operating systems on one computer.
Install new OS wizard	Starting the Install New OS Wizard to install a new operating system.
Help and Documentation	•
😵 Hard Disk Manager™ Help	Launching the help system (you can also do it by pressing F1).
Mout Hard Disk Manager**	Opening the page which contains information about the program. This page will be displayed in the Explorer Bar.
Script Manual	Opening a brief review on the Paragon Scripting Language.

Disk Map

The Disk Map is displayed in the Explorer Bar when the Disk View tab is selected. It is located either at the top or at the bottom of the window, depending on the state of the Disk Map Location option (Main Menu: View > Disk Map Location).

As the name infers, the Disk Map displays the layout of physical and logical disks. Physical disks are represented with rectangle bars that contain small-sized bars. These small-sized bars represent logical disks. Their color depends on the file system of the appropriate partition.

lak Map	-
Basic Hard Disk 0 (VMware, VMware Virtual S SCSI Disk Dev)	i i i
Local Disk (C:)	
499.9 GB NTFS	

Large-sized bars display the following information about physical disks:

- Manufacturer,
- Model.

44

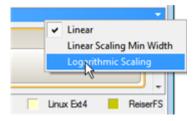

Small-sized bars display the following information about logical disks:

- Serial number,
- Drive letter,
- Total size,
- File system.

Furthermore, it is possible to estimate the used disk space by looking at the size of the bar's shaded area. The program offers to choose from several types of the disk layout scaling. It's done especially to increase the program usability. For instance, if you've got a high capacity hard drive containing both very large (more than 100 GB) and rather small (less than 10 GB) partitions, you can select the logarithmic type to make all partitions readable, otherwise (selecting the linear type) you won't be able to see small partitions at all, but thing strips. On the other hand, if the proportional disk layout is critical for you, the linear type is exactly what you need.

Nevertheless there's a compromise solution – linear scaling with the minimal limit to small partitions. So if a partition is too small it will remain readable.

Just click on the arrow icon on the top right side of the Disk Map to select the desired scaling type.

Disk Map is synchronized with the Explorer Bar. Thus by selecting a disk on the Disk Map, the Explorer Bar will automatically display detailed information on it.

The drag-and-drop functionality is not available when the logarithmic type of the disk layout is selected.

Explorer Bar

The Explorer Bar is located in the center of the main window which emphasizes its importance. The bar displays reference information including:

- The help system
- General information on the product including its name, version and a list of helpful links
- Detailed information about disks selected on the Disk Map
- List of scheduled operations
- List of archives
- Volume Explorer utility
- Disk Editor utility

According to these categories the Explorer Bar has several tabs:

- **Disk View**, which offers the user the following options:
 - Partition List to get a clear-cut picture of the current state of the system hard disks/partitions
 - Disk Editor to view/edit sectors of the selected partition/hard disk

- <u>Volume Explorer</u> to browse and export contents of the selected partition/hard disk
- Properties to view detailed information on the selected partition/hard disk in the bright graphical form

You can switch between these components by clicking tabs on the left side of the Explorer Bar.

- <u>Scheduled Tasks</u>, which gives the user the possibility of browsing and editing scheduled operations and the program scripts.
- Archives, which enables to manage the Archive Database.
- Help, which contains the program help and general information on the product.

You can access the desired information by clicking on the appropriate tab.

The Explorer Bar is a fully-functional embedded HTML browser, which offers the possibility to address, for example, the company's website to look through important technical notes or download the latest updates without having to close the program.

The program help is also HTML-oriented. You can read it and follow external links from to get additional information.

To easily navigate through browsed pages, the program provides the following functionality:

BUTTON	FUNCTIONALITY
	Return to the previously browsed page
	Open the next browsed page
×	Stop loading the current page
•	Refresh the contents of the current page

Partition List

The Partition List is another helpful tool that enables you to get a clear-cut picture of the current state of the system hard disks/partitions. Partitions are sorted according to their starting position. For every item of the list there is the possibility to call the context-sensitive popup menu with available operations. Besides, the program provides detailed information on all hard disks/partitions found in the system including the following properties:

- Name,
- Volume label (if exists),
- Partition type (Primary/Extended /Logical),
- File system type,
- Size,
- Amount of used and unused (free) space,
- Start/End cylinder,
- Start/End head,

- Start/End sector

- Free size in sectors/bytes
- Active/Inactive attribute
- Hidden/Unhidden attribute

You may customize outlook of the Partition List by clicking on the arrow icon on the top right side of the panel.

Name	Move up
Size (sectors)	
FS Size (sectors)	Move dov
Used (sectors)	
Start (sectors)	
End (sectors)	
Start CHS(hex)	
End CHS(hex)	
Туре	
File system	
Volume label	
Parttion size	
] Size	
] Used	
Free (sectors)	
Free	
Active	
] Hidden	
Letter	
Parttion ID	
Sectors per Cluster	
Slot	

By marking a checkbox opposite the required item you can choose whether to display it or not. Besides, you can change its order by pressing the Move up or Move down buttons.

If you don't need the Disk Map, please click the shown below icon to disable it:

Start (sectors)	End (sectors)	Start CHS(hex)	End CHS(hex)
800h	235F87FFh	0 20 21	904D 61 14
235F8800h	3E7FEFFFh	904D 61 15	FEF6 94 1E
800h	3E7FEFFFh	0 20 21	FEF6 94 1E

Properties Bar

The Properties Bar provides information on the selected at the moment partition/hard disk:

For a hard disk

- Model,
- Serial number,
- Type of hard disk (basic or dynamic),
- Total size (in GB),
- Information on geometry of the disk (amount of sectors per track, heads and cylinders).

For a partition

- Drive letter assigned to the disk,
- Volume label (if available),
- Type of the logical disk,
- File system (represented by the color of the graph and the selected bar),
- Total size, used space and free space (in GB or MB).

Besides you can modify practically any partition property by clicking on the required value.

Legend Bar

The Legend Bar explains the color scheme used for disk and partition presentation. You can hide (or show) the bar with the appropriate Main Menu item: View > Disk Map Legend. When it is activated it can be found at the bottom of the Explorer Bar.

The program distinguishes between the following types of known file systems:

- FAT16/32
- NTFS
- Linux Ext2/3/4
- Linux ReiserFS
- Apple HFS

Status Bar

This is the bottom part of the main window. The Status Bar displays menu hints, for each item the cursor points to.

The user can hide (or show) the bar with the appropriate Main Menu item: View > Status Bar.

Settings Overview

The Settings dialog is available from the Main Menu: Tools > Settings. All the settings are grouped into several sections, which functions are described in the following paragraphs. The list of sections is placed on the left side of the dialog. By selecting a section from the list, you can open a set of options.

To get a detailed description to any setting, control, or field of the program just click the hint button and then the object you need.

General Options

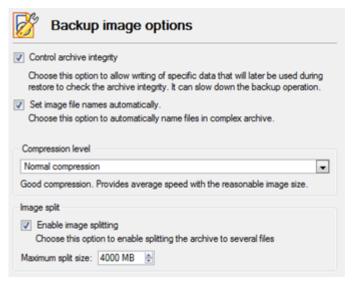

<u> </u>	General options	
	on Alignment Mode	_
Vista Allign	partitions according to the rules used in Windows Vista and later OSes.	
Check	k FS integrity policy	
Once)	
integri	ard protection from data loss with acceptable performance. The file system ty will be checked for each volume only once just before accomplishing ensitive operations.	
Data	Loss Protection mode	
Rese	t	
Media	um protection from data loss.	

This section contains a set of general options that will be taken into account during any operation carried out with the program:

- Partition Alignment mode. There are three options you can choose from:
 - **Legacy**. DOS and Windows OSes before Vista required that partitions had to be aligned to the "disk cylinder" or 63 sectors to address and access sectors correctly. It was OK, until 4K hard drives came into scene. When partitions are aligned this way on this type of disk, each logical cluster is linked to two physical 4K clusters, thus resulting in a double read-write operation.
 - Vista. Since Windows Vista, operating systems do not use the archaic CHS (cylinder/head/sector) addressing scheme, but the Logical Block Addressing (LBA), where sectors are addressed continuously over the whole disk drive. It is optimal for both, 512B and new 4K disk drivers.
 - Inheritance. Select the option to disable automatic alignment of partitions.
- **Check FS integrity policy**. Accomplishment of any data-sensitive operation (resize, move, merge, redistribute, change cluster size, etc.) is potential with data loss. To minimize this risk, it's recommended to check integrity of your file system before this type of operations, despite the fact that it's quite time consuming. We offer you several options to let you choose, which is best for you:
 - **Always**. Maximum protection, but minimal performance. The file system integrity will be checked each time it's necessary to guarantee the maximum protection for the on-disk data.
 - **Once**. Standard protection with acceptable performance. The file system integrity will be checked for each volume only once just before accomplishing data-sensitive operations.
 - **Never**. No protection, but maximum performance. If you're not 100% sure your disk is rock solid, please do not use this option.
- Data Loss Protection mode. To guarantee safety for your information when a data-sensitive operation has been abruptly interrupted as a result of a computer reset, or a power outage, there are several techniques, that correspond to the options below:
 - **Do not protect**. No protection, but maximum performance. If you're not 100% sure you're completely safe from a power outage, or an accidental reset of your computer, please do not use this option.

- **Reset**. Standard protection with acceptable performance. Maintaining a special journal, our program enables to automatically complete a data-sensitive operation interrupted by an accidental reset of your computer from our bootable recovery media, thus reviving the corrupted partition.
- **Power loss**. Maximum protection, but minimal performance. Besides journaling, our program will also disable cache of your disk when accomplishing data-sensitive operations to avoid data loss even in case of a power outage.

Backup Image Options

This section contains a set of options that will be taken into account during backup/restore operations:

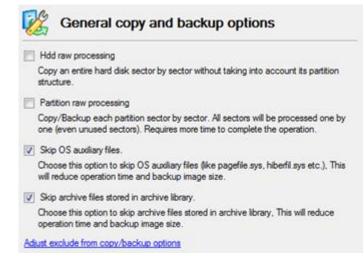

- **Control archive integrity**. Mark the checkbox to guarantee that all backup images created with the program are 100 percent flawless. If you decided not to control the archive integrity, the backup operation would take about 3-5% less time.
- Set image file names automatically. Mark the checkbox to make the program automatically set a file name for every volume of a complex backup image. Otherwise you will need to do it manually during the backup operation.
- **Compression level**. From the pull-down list you can select the desired compression level for backup images that will be used by default.
- Enable image splitting. Mark the checkbox to automatically split every backup image to volumes of a particular size.

Splitting images enables to tackle problems caused by a maximum file size limitation of some file systems.

• Maximum split size. With the spinner control you can specify a maximum size for backup volumes.

General Copy and Backup Options

This section contains a set of options that will be taken into account during copy and backup operations:

- HDD raw processing. Mark the checkbox to copy/back up a hard disk in the sector-by-sector mode, thus ignoring its information structure (e.g. unallocated space or unused sectors of existing partitions will be processed as well). This can help to avoid problems with hidden data created by certain applications or the system administrator. However, it will take more time to accomplish the operation.
- **Partition raw processing**. Mark the checkbox to copy a partition in the sector-by-sector mode to successfully process unknown file systems. However it is not recommended to enable this option when working with supported file systems as it takes more time to accomplish the operation.
- Skip OS auxiliary files. Mark the checkbox to skip OS auxiliary files (like pagefile.sys, hiberfil.sys, etc.), thus reducing the operation time and the resulted size of the backup image.
- Skip archive files stored in archive library. Mark the checkbox to skip backup images registered in the archive database, thus reducing the operation time and the resulted size of the backup image.

By clicking the link at the bottom of the window you can jump to the <u>Copy/Backup Exclude</u> <u>Options</u>.

CD/DVD/BD Recording Options

Recording speed	
Select speed automatically	
Auto recording speed. Choose this option to speed.	allow the recorder to choose the best
Boot options	
Specify a bootable ISO image to place on C	D, DVD or BD along with backup data:
.\\ISO\bootcd.iso	Browse
Specify how would you like to boot from CD	, DVD or BD:
Boot from any CD, DVD or BD	
ISO image folder	
/	Browse

This section contains a set of options that will be taken into account during CD/DVD/BD burn operations:

- Burn every CD/DVD/BD to the end. By default, the program does not create ISO 9660 compliant burning sessions, as it processes data on-the-fly and can only estimate the resulted session size. That's why no third party tool will get access to the recorded data. To tackle the issue, mark the checkbox to make the program create a standard Disk-at-Once session. It may slow down the burning process, as every CD/DVD/BD will be recorded up to the end, no matter how much actual information to contain.
- **Recording speed**. The user may define how fast a CD/DVD/BD will be recorded (minimum, normal and maximum). Besides there is an automatic mode when the program will set the most appropriate speed for every CD/DVD/BD.
- **Bootable ISO image**. That's the image to be placed together with the backup data. By default, the program offers its own bootable ISO image, which contains a Linux/DOS recovery environment. However, the user is free to use any bootable ISO image.
- **CD/DVD/BD boot capability**. The program enables to choose whether any recorded CD/DVD/BD will be bootable, or only the first one for a session, or without that function at all.
- Folder where the ISO image is to be placed. When the user decides not to physically burn a CD/DVD/BD, but create an ISO image file, this very folder will be used to contain these images.

Hot Processing Options

Hot processing technology			
Microsoft Volume Shadow Copy Service			0
Microsoft Volume Shadow Copy Service is a up volumes being locked by numerous active spplications. Microsoft VSS technology requi any mounted NTFS volume for temporary dat Windows XP and newest Windows versions, Windows (98/ME/NT/2000).	transac res over a. This t	tions of VS 300 MB of echnology	S supporting free space on is provided for
Additional options			
Always use hot processing			
 Always use hot processing Use hot processing only when partition 	on is loc	ked	
Company and the second	on is loc	ked	
Use hot processing only when partition	on is loc	ked	
Use hot processing only when partitive: Hot processing temporary drive:	on is loc	ked	

In this section you may configure the hot processing mode:

- **Enable hot processing**. Mark the checkbox to enable the so called hot data processing mode that is specially designed to process data without restarting your operating system.
- Hot processing technology. From the pull-down list you can select the required hot processing technology.
- Always use hot processing. Select the option to process partitions without making them locked. Thus you will be able to keep working with them as usual.
- Use hot processing only when partition is locked. Select the option to use the hot processing only when partitions are locked and cannot be processed without restarting the computer. Please keep in mind, that once you start any operation on a partition in this mode, it will automatically be locked by the program, thus you won't be able to keep working with it as usual.
- Hot processing temporary drive. Here you can select a disk drive that will be used to store the temporary hot backup data (by default C:).
- Attempts to start VSS. Here you can set how many attempts to start Microsoft VSS the program is to do before automatically rebooting the system and accomplishing the operation in a special boot-up mode.
- **Timeout between attempts (in seconds)**. Here you can set a time period between different attempts to start Microsoft VSS.
- Switch between hot processing technologies. Mark the checkbox to automatically switch between Paragon Hot Processing and Microsoft VSS if one of them is unavailable at the moment.

By clicking the link at the bottom of the window you can jump to the <u>Run during Backup</u> <u>Options</u>.

Run during Backup Options

For backup operations in the Paragon Hot Processing mode you have a possibility to run extern programs and commands at different stages of the backup process. The key point to link such execution to is a short period of time when a snapshot is taken. (Snapshot is a map of used plocks; the system is totally frozen for writing when it is taken).	
Please specify executable files for each stage if nece	ssary:
Execute at the beginning of the backup process be	fore taking a snapshot
Enter a file name here	Browse
Execute after taking a snapshot	
and and and taking a simplified	
Enter a file name here	Browse
	Browse

In this section you can specify external applications to execute at various phases of the backup process. It can be particularly useful when imaging systems with high availability requirements (MS SQL, MS Exchange, etc.), since it enables to create a consistent snapshot even as the data is currently modified. The point is to provide a coherent state of all open files and databases involved in a backup, taking into account that applications may still keep writing to disks.

Actually the backup process consists of two phases: the preparation phase (snapshot) and the data-copying phase. There are three points of the backup when external commands/programs can be launched:

- Execute at the beginning of the backup process before taking a snapshot. Here you can specify an executable file that will help you to prepare running applications for taking a snapshot. It may contain specific commands/programs to delete unnecessary files, suspend services, flush transactions or caches, etc. Everything depends on the used applications.
- **Execute after taking a snapshot**. Here you can specify an executable file that will run just after taking a snapshot. It may contain specific commands/programs, e.g. to resume the previously suspended services, etc. Everything depends on the used applications.
- Execute after finishing the backup process. Here you can specify an executable file that will run after the backup process has been accomplished. It may include commands/ programs that will move the backup image to a particular location, etc.

By clicking the link at the bottom of the window you can jump to the <u>Hot Processing</u> <u>Options</u>.

By clicking the Browse button you can get into the browser-like window to choose an executable file.

		Open Cancel

The program provides the ability to work with three types of executable files (.exe, .bat, .cmd). It is up to the user to write batch files to safely prepare applications for backup. There are some certain general requirements for that:

- All programs and commands must execute sequentially and finish before the .bat file completes its work.
- It is recommended to use external commands/programs in the following format **Start/wait program.exe**. The **wait** option will help to start an application and wait until it completes its work. This will guarantee that all included commands/programs complete their execution before the batch file does.

This function is only available when the Hot Processing mode is enabled.

The program enables to set parameters for an executable file directly from the line. However, if the file path contains word gaps it is necessary to enclose it in quotes in order to make the program distinguish between the path and the used parameters.

By clicking the link at the bottom of the window you can jump to the <u>Hot Processing</u> <u>Options</u>.

Wipe Options

Here you can set a specific data erasure algorithm that will be used by default during wipe operations.

The list of supported military and government standards may vary for your product.

Wipe Report Options Wipe report structure options Please enter customer information to put in data sanitization reports: Customer name: Customer organisation: Please enter a company n If you did not provide any information in these fields the default system data will be displayed Please mark the issues to be placed in data sanitization reports: System information Choose this option to put system information in report. System information includes a computer name, OS and BIOS versions. Hardware information Choose this option to put information about hardware used in your computer in report. This section includes information about processors, disk drives, network and USB adapters etc. Bad blocks information Choose this option to put information about found bad blocks. This includes total bad blocks count and a bad sectors list. Supervisor Approval Please choose this option if wipe reports require mandatory formal approval from an executive or supervisor. If enabled, every wipe report will contain a signature field for a person responsible for duly data sanitisation procedures in your company Font size to use when printing report: Middle fonts (12 pts)

In this section you can specify contents and properties of generated wipe reports:

- System information. Mark the option to include a computer name, BIOS version and the used operating system.
- Hardware Information. Mark the option to include information on the used processor, disk drivers, network and USB adapters, etc.
- Bad blocks information. Mark the option to include information on the found bad blocks.
- Supervisor Approval. Mark the option to add a signature field for an executive or supervisor responsible for data sanitization procedures in your company.
- Font size... Select the most suitable font size from the list (12 pts by default).

Partitioning Options

This section contains a set of options that will be taken into account during partitioning operations:

• Enable 64 KB cluster size for FAT16. Mark the checkbox to enable 64KB clusters for FAT16 partitions. Thus you will be able to create FAT16 partitions up to 4GB in size

Due to the maximum cluster size of 32KB for Windows 95/98/ME or MS DOS, FAT16 partitions larger than 2GB are not reliably accessible under these operating systems.

- **Request confirmation before partition deletion**. Mark the checkbox to activate an additional security mechanism. Thus when going to delete a partition you will be automatically requested to enter its label.
- Request confirmation when converting FAT16 to FAT32. Mark the checkbox to automatically request confirmation before converting FAT16 to FAT32. There are a number of situations when this kind of conversion is the only way out to accomplish the operation. For instance, you are going to migrate your system to a larger hard disk with the proportional resize of existing partitions, what is very convenient. As a result you can get original FAT16 partitions go beyond the 4GB limit. Thus without conversion to FAT32, this operation will in no way be possible to accomplish. The same goes for any copy hard disk/partition or restore hard disk/partition operation involving an extra upsizing.

E-Mail Options

Specify your e-mail accou	unt options:
Outgoing mail server (SMTP):	Enter a server name here
User e-mail address:	Enter an e-mail address here
My outgoing server requ	uires authentication
User name: Enter an user	name here
Password: Enter a passw	rord here
Send E-Mail notification To: Enter an e-mail address Send mail in HTML form Send complete report af Send graphical view of 1	s here lat
Select the operations you w	ould like to be notified about

This section contains a set of options that will be taken into account during the Send log files and Send e-mail notification operations:

- Outgoing mail server (SMTP). To send messages by using the built-in mail client, it is necessary to have access to a computer running an SMTP (Simple Mail Transfer Protocol) server. All outgoing messages are first sent to the SMTP server, which in its turn delivers them to the required recipients. The address may be represented as a traditional Internet host name (e.g.: mail.com) or as an IP numeric address (e.g. xxx.xxx.xxx).
- User e-mail address. Specify an e-mail address that has been assigned by the Internet Service Provider or
 organization's e-mail administrator.
- **My outgoing server requires authentication**. Activate the option to allow the program to make authentication on the server before sending messages.
 - User name. Enter the name that will be used to log in to the e-mail account.
 - Password. Enter the password that will be used to access the mail server.
- Send e-mail notification on apply. Specify an e-mail to send notifications on the carried out operations.

- Send mail in HTML format. Activate the option to create messages in the HTML format instead of plain text.

- **Send complete report after applying operations**. Activate the option to create an in-depth report on the carried out operations and send it after performing the last operation.

- **Send graphical view of the disk sub-system before and after apply**. Activate the option to allow the program to attach two pictures of the disk layout made before and after the operation is completed.

By clicking the link at the bottom of the window you can jump to the <u>Operation</u> <u>Dependency Options</u>.

Operation Dependency Options

📝 Oper	ration dependency options	
Please select a ta committed.	sk to be carried out when one or more of the following o	operations are
Perform the task:	Send e-mail notification	
Operation		*
	boot on new hardware boot on virtual hardware	E
Boot record o Change NTF	correction	
Change SID	5 Version	
Check file sys		
Compact \$M		
Copy partition	amic Disk to Basic	
tertain a second	n with files exclusion	-
Select all	Clear all Restore defaults	

This section contains a set of options that will be taken into account when the Send e-mail notification on apply function is enabled. By marking/unmarking a checkbox opposite the required operation you can choose whether to receive an e-mail notification on its completion or not.

You won't be notified if an operation requires the system restart.

Virtual Mode Options

In this section you may configure the virtual mode:

• Allow virtual mode. Mark the checkbox to enable the virtual mode. It is an effective way of protection from any troubles, since no operation will be executed until confirmation, thus giving you a second chance to weigh all pros and cons of this or that particular operation.

We strongly recommend you to enable this mode.

 Close progress dialog automatically. Mark the checkbox to automatically close the progress dialog after accomplishing operations.

File System Conversion Options

X	File system conversion options	
Select	a time zone:	
(G	MT) Greenwich Mean Time; Dublin, Edinburgh, London, Usbon	
Select I	language for file names:	
En	nglish (CP-850)	
The	is language will be used to specify national symbols in file names.	
Co	nfim settings before NTFS <> FAT/FAT32 conversion.	
	oose this option to make the program to allow to customize these setti e when converting file systems.	ngs each

This section contains a set of options that will be taken into account when converting FAT and NTFS file systems. By default, the program takes locale (regional) settings from the system. Problems might occur however because of different standards for file names and file time stamps (Created, Modified and Last Access Time) of NTFS and FATxx file systems.

To tackle problems of that kind you can manually set:

• **Time zone** to use during the convert operation. NTFS keeps file timestamps in GMT (Greenwich Mean Time) while FAT uses a fixed local date and time. The program takes proper account of these differences and enables to adjust timestamp values.

An incorrectly chosen time zone might lead to inability to launch certain software.

• Language for file names to use during the convert operation. NTFS stores file names in Unicode while FAT/FAT32 uses ANSI to save short file names (also called the DOS aliases). The codepage information is required for the correct conversion of non-English file names from Unicode to ANSI and vice versa.

An incorrectly chosen codepage will certainly result in corruption of non-English file names.

Request confirmation of settings before NTFS < - > FAT/FAT32 conversion. Mark the checkbox to automatically
display the local settings dialog to check and modify (if necessary) the default parameters before launching the
convert file system operation.

Copy/Backup Exclude Options

- E FI	es that contains yo	ur e-mail data (9 fiters)	
Add filter	Rename category De	elete category	
•.wab	Delete filter		=
•.pab	Delete filter		
•.oab	Delete filter		
•.pst	Delete filter		
*.ost	Delete filter		
•.dbx	Delete filter		
*.log	Delete filter		
*.rwz	Delete filter		
 .contact 	Delete filter		
- Ex	ecutable & Installat	tions (8 filters)	
Add filter	Rename category De	elete category	

In this section the program enables to specify what data should be automatically ignored during copy and sector-based backup operations. You can filter certain files or folders either by the manual selection or by creating masks, what is more preferable. Thus you will be able to effectively manage contents of your backup images or partition/hard disk copies.

By default, there are no available filters. To create a filter, please click the Add Category... button.

👌 Create ne	w category	? 🗙
Name:		
Filter:	Enter a mask or file name here Brow	vse
Description:	Enter filter description here	
	use wildcards ? and * as file name mask. Wil are not allowed.	dcards
	OK Can	cel

In the opened dialog the program allows the user to define the following parameters:

- Name. Give to the filter any name you like, but try to use an informative one;
- Filter. Press the Browse button to select files or folders you would like to be excluded or specify a filter mask by using * or ? wildcards;
- **Description**. Add a short description to the filter not to miss it up later.

Click the OK button and you will get a new item on the list of filters. By marking/unmarking a checkbox opposite its name you can choose whether to use it or not.

By clicking the link at the bottom of the window you can jump to the <u>General Copy and</u> <u>Backup Options</u>.

File Backup Exclude Options

cify masks for files and folders that must be excluded from	n archives:
Executable & Installations (8 filters)	ŕ
Add filter Rename category Delete category	
*.dll Delete filter	
*.exe Delete filter	E
•.ocx Delete filter	
.vxd Delete filter	
.cab <u>Delete filter</u>	
.msi Delete filter	
msp <u>Delete filter</u> drv <u>Delete filter</u>	
Auxiliary files (18 filters)	
Add filter Rename category Delete category	
*.bak Delete filter	
*.old Delete filter	

In this section you can find a lot of ready-made exclude filters to effectively control contents of your file-based backup images. Please note, by selecting certain filters you specify what data will be ignored during file-based backup operations, thus you specify the data you'd like not to be added to the resulted archives.

Anyway you've got the option to create your own filter by clicking the Add category... button.

w category	2 🛋
Enter a mask or file name here	Browse
Enter filter description here	
n use wildcards ? and * as file name m are not allowed.	nask. Wildcards
	Enter filter description here

In the opened dialog the program allows the user to define the following parameters:

- Name. Give to the filter any name you like, but try to use an informative one;
- Filter. Press the Browse button to select files or folders you would like to be excluded or specify a filter mask by using * or ? wildcards;
- **Description**. Add a short description to the filter not to miss it up later.

Click the OK button and you will get a new item on the list of filters. By marking/unmarking a checkbox opposite its name you can choose whether to use it or not.

File Backup Include Options

iony mas	ks for files and folders that must be added to archive	рэ.
	Readable files (44 filters)	ŕ
Add filte	Rename category Delete category	:
•.chm	Delete filter	
*.htm	Delete filter	
*.mht	Delete filter	
*.html	Delete filter	
*.pdf	Delete filter	
*.txt	Delete filter	
*.hlp	Delete filter	
*.rtf	Delete filter	
•.doc	Delete filter	
*.docx	Delete filter	
•.xls	Delete filter	
*.xlsx	Delete filter	
*.wri	Delete filter	
•.ppt	Delete filter	
	Delete filter	

In this section you can find a lot of ready-made include filters to effectively control contents of your file-based backup images. Please note, by selecting certain filters you specify what data will be processed during file-based backup operations, thus you automatically ignore files that do not match, so they won't be added to the resulted archives.

Anyway you've got the option to create your own filter by clicking the Add category... button.

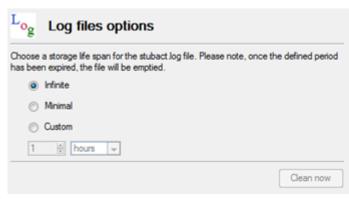

Filter: Enter a mask or file name here	Browse
Description: Enter filter description here	
You can use wildcards ? and * as file name m in path are not allowed.	ask. Wildca
in path are not allowed.	Cancel

In the opened dialog the program allows the user to define the following parameters:

- Name. Give to the filter any name you like, but try to use an informative one;
- Filter. Press the Browse button to select files or folders you would like to be excluded or specify a filter mask by using * or ? wildcards;
- **Description**. Add a short description to the filter not to miss it up later.

Click the OK button and you will get a new item on the list of filters. By marking/unmarking a checkbox opposite its name you can choose whether to use it or not.

Log Files Options

In this section you can specify a storage life span for the stubact.log file:

- Infinite not to empty the file ever;
- Minimal to have the file emptied all the time;
- **Custom** to set a certain storage life span for the file. Please note, once the defined period has been expired, the file will be emptied.

We strongly recommend you not to choose the Minimal option, as in case of having problems with the program, our Support Team won't be able to study operation logs, thus help you out.

Viewing Disk Properties

The main tool to view in-depth information on the properties of hard disks is the <u>Disk Map</u>. It represents the actual state of the computer's hard disks.

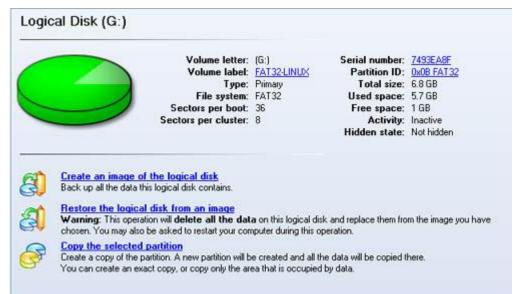

Generally the hard disks are represented on the map by rectangular bars, which also contain small-sized bars. The smallsized bars represent logical disks (partitions). When you select a large-sized bar, the <u>Explorer Bar</u> displays information about the disk in a bright, graphical form.

/		Basic Hard Disk Drive
	Total size:	
	Sectors per track:	
~	Heads:	
-	Cylinders:	1245
-		
	Create an image of the entire disk Back up all the data this hard disk contains. All th	he partitions on this disk will be added to the archive.
	Back up all the data this hard disk contains. All th <u>Restore an image of the entire disk</u> Warning: This operation will delete all the data warded the data the da	he partitions on this disk, will be added to the archive. at a on this hard disk. All the partitions will be replaced with ones fror sked to restart your computer during this operation.
	Back up all the data this hard disk contains. All th <u>Restore an image of the entire disk</u> Warning: This operation will delete all the data warded the data the da	ata on this hard disk. All the partitions will be replaced with ones fror
	Back up all the data this hard disk contains. All the <u>Restore an image of the entire disk</u> Warning: This operation will delete all the dat the image you have chosen. You may also be as	ata on this hard disk. All the partitions will be replaced with ones fro

The model and serial number of the disk serve as the title of the browsed page. The disk layout is shown in form of a circular graph, where the color of a sector corresponds to a file system of an appropriate partition. On the right you may see a table, which contains the following information:

- Type of hard disk (basic or dynamic),
- Total size (in GB),
- Information on geometry of the disk (amount of sectors per track, heads and cylinders).

Below there is a list of available wizards. If you click a corresponding record the appropriate wizard will be started. All default values for the operation parameters will correspond to the disk's settings. The list of wizards contains a detailed description of tasks that can be performed by the wizard. This nullifies the possibility of selecting the wrong wizard.

When you select a small-sized bar (i.e. corresponding to a logical disk) the Explorer Bar will display information on it as well. The page title will contain a drive letter, which is assigned to the disk. The disk layout graph will be colored in accordance with the volume ratio of the used space to the free space (the light colored sector). The table on the right will contain the following information:

- Volume label (if available),
- Type of the logical disk,
- File system (represented by the color of the graph and the selected bar),
- Total size, used space and free space (in GB or MB).

Below there is a list of wizards, which may be called for this disk. All default values of parameters will correspond to the disk settings.

Viewing Image Properties

General information on backup archives can be obtained either with the following tools:

Using the Restore Wizard

• In the Main menu: select Wizards > Restore...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

At first, the wizard displays the Welcome page – simply click the Next button at the foot of the dialog window.

The next page refers to Browse for Archive. By clicking the **Switch to Archive List View** link, you can see a list of images contained in the Archive Database (if any).

🕼 Restore Wizard	? 💌
Browse for Archive Please select an archive to restore.	a

< Back Next >	Cancel

To get a clear-cut picture on properties of the required image, just click on it and the section below will (i.e. Archive File Details) display a short description, including:

- Information on a type of the archive contents (whether it is sector-based or file-based),
- Whether the archive is compressed or not,
- Whether the archive is password protected or not,
- The date, when the archive was created.

In addition, there are some special graphical flags to indicate crucial properties:

FLAG	FUNCTIONALITY
8	Disk archive
S	Partition archive
	File archive
	MBR archive
08	System archive
0	Encrypted archive

If you want to restore the image contents, click the Next button. In order to cancel, click the Cancel button.

Using the Archive Database

To open the Archive Database, click the appropriate tab in the Explorer Bar. The database window can be conditionally subdivided into several sections that differ in their purpose and functionality:

Besides the program provides all the necessary functionality to manage backup images in the database (add, delete, mount, refresh, etc.)

All panels offer a synchronized layout and are separated by vertical and horizontal expandable sliders, allowing the user to customize the screen layout.

Data Backup and Rescue

In this chapter you will find all the information necessary to establish a reliable data protection system.

Creating Backup Images

Depending on a type of information you need to protect and the way this information should be processed, the program offers a number of handy backup wizards. To make your job with the program as easy and convenient as possible, all backup wizards share similar work algorithm. By going through steps of the wizard, you configure all the necessary settings to launch the backup operation. To minimize the possibility of making any mistake, the wizard provides auxiliary information on every single option. Moreover you can get an in-depth description to any setting, control, or field of the wizard just by clicking the hint button and then the object you need.

Smart Backup Wizard Startup

• In the Main Menu: select Wizards > Smart Backup

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Smart Backup Wizard Setup

The wizard offers the following steps to accomplish the backup operation:

• The object to back up. Click on a section you find answering to your task.

- Disk or Partitions to create a sector-based backup of the whole disk system, or only separate partitions;

- **E-mail** to create a file-based backup of e-mail databases, accounts and address books of MS Outlook, MS Express, and Windows Mail;

- **Media Files** to create a file-based backup of all media files (photo, video, music, etc) stored in the My Documents folder;

- Documents to create a file-based backup of all office documents stored in the My Documents folder;
- Other Files and Folders to create a file-based backup of any files and folders.

If selecting Disk or Partitions or Other Files and Folders you will need to specify more exactly the object of operation. To know more on the subject, please consult the <u>Backup</u> <u>Scenarios</u> chapter.

• Name and location of the resulted image. Provide a file name for the new image and its exact location. The program automatically offers an easy to understand name containing the date and the time of the archive creation, which can anyway be modified.

rchive location:	G:/arc	_test/				a)	< 5
Name				 	 	 Size	Date
🛛 🛃 My Comp	uter						
🕀 💽 Loca	l Disk (C	3)					
🕀 💽 Loca	I Disk (E	:)					
🕀 💽 Archi							
🗄 🐻 image		0.0.1.164\e)	(Z:)				
🗄 🐻 image			(Z:)				
🗄 🐻 image			(Z:)				
🗄 🐻 image			(Z:)				
🗄 🐻 image			(Z:)				
The second	es (\\20	0.0.1.164\e)	(Z:)	1			
Archive details	es (\\20 a	0.0.1.164\e)	(Z:)]	 		
Image I	es (\\20 a	0.0.1.164\e)	(Z:) 2 MB]	 		

The program automatically calculates size of the future archive and informs the user about space available on the selected destination.

• Archive Comment. You can add some additional description to the archive that will later help to distinguish it from the others.

_	enter a short comment to describe the archive
\mathbf{N}	No comment

Result

After the backup operation is completed you receive an image of the selected object. This image is placed into the specified destination, its features defined by the wizard.

Available operation scenarios:

- Backing up a hard disk or partition to the Backup Capsule
- Backing up a hard disk or partition to external media (CD/DVD)
- Backing up a hard disk or partition to a network drive
- Backing up files to an FTP/SFTP server
- Backing up a dual boot Mac to an external USB drive
- Backing up files to a local mounted/unmounted (without drive letter assigned) partition
- Creating a differential to a full partition backup
- Creating an increment to a full partition backup
- <u>Creating an increment to a full file backup</u>
- <u>Creating a cyclic partition backup</u>
- Merging a full partition backup with one of its differentials

Restoring System and Data

The program includes a convenient and reliable restore wizard. With its help you can restore all types of backup images created with the program. It provides easy to understand instructions to configure and perform all the necessary settings. Moreover you can get an in-depth description to any setting, control, or field of the wizard just by clicking the hint button and then the object you need.

Startup

• In the Main Menu: select Wizards > Restore...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Setup

The wizard offers the following steps to accomplish the restore operation:

• A backup image to be restored. The Browse for Archive page enables to find a backup image you need.

By clicking the **Switch to Archive List View** link, you can see a list of images contained in the Archive Database (if any).

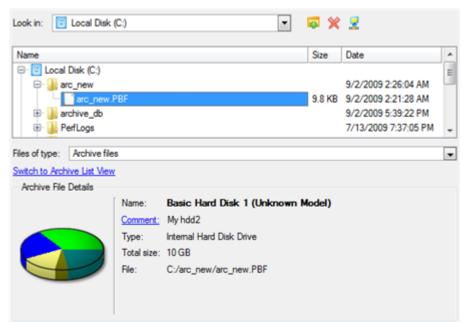

Туре	Creation Date 🔍	Source Object	Size
2	9/2/2009 5:06:03 AM	File-level Archive	4 KB
3	9/2/2009 2:33:00 AM	Local Disk (C:)	499.9 GB
	9/2/2009 2:21:01 AM	Basic Hard Disk 1 (VMware, VMware Virtual S SCSI Disk Dev)	10 GB
([
Archive File Comment:			
		M Total size: 4 KB (4,096 Bytes)	
Backup dat	te: 9/2/2009 5:06:03 A		
Backup dat	te: 3/2/2009 5:06:03 A	Archive size: 445 Bytes	
Backup dal			

To get a clear-cut picture on properties of the required image, just click on it and the section below will (i.e. Archive File Details) display a short description.

To know more on the subject, please consult the <u>Viewing Image Properties</u> chapter.

By clicking the **Switch to File View** link, you can find the required image in the browser-like window. The section below (i.e. Archive File Details) will also display a short description of the selected image.

Moreover, on this page you've got the possibility to create new folders, delete existing files/folders or map network drives by clicking the appropriate buttons.

File Backup Restore

• **Data to restore**. You've got the option to restore not only the entire archive, but separate items of it (the so called selective restore functionality) by marking checkboxes next to the data items you need.

Name	Туре	Size
FB Archive FB Archive C: Users Users C: Desktop	File Level Archive	113.1 KB (115,869 Bytes)
Images Images	File File	33 KB 13.5 KB 23.9 KB 34.6 KB
Fo continue, click Next	Dat	a size to restore: 46.5 KB

• A place to restore. From the pull-down list you can choose whether to restore contents of the backup image to its original location or specify some other one.

Copyright© 1994-2011 Paragon Software Group. All rights reserved.

72

Besides if you select the Original location option, you can additionally define whether to replace already existing files during the restore operation (good for recovering presumably corrupted files) or leave them intact (good for recovering accidentally deleted files).

Sector Backup Restore

• **Data to restore.** You've got the option to restore not only the entire archive, but separate items of it (the so called selective restore functionality) by marking checkboxes next to the data items you need.

Name	Type	File system	Size	Used
Basic Hard Disk 1 (Unknown Model)	Internal Hard Disk Drive		10 GB	
- Stocal Disk (*)	Primary	Linux Swap2	509.8 MB	4 KB
🖲 😔 Local Disk (*)	Primary	Linux Ext3	1.4 GB	58.1 MB
System Volume Inform	Primary	NTFS	2.4 GB	356.3 MB
	III.co			
⊕ SNEW VOLUME (E:)	Primary	FAT32	3.4 GB	4 KE
Archive Details	Primary	FAT32	3.4 GB	4 KB

If you select separate files or folders to restore, the wizard will continue working as though you've got to do with a file backup.

• A place to restore. Selecting the destination, please note - all contents on the disk selected for restoring purposes will be deleted during the operation.

To help you get a clear-cut picture of the operation outcome, the program allows inspecting the resulted disk layout.

Restoring Partition:

• Size of the restored volume and free space before and after it on the disk.

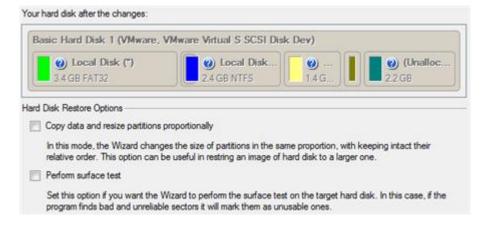

Geometry Restore Options				
Please specify the size of the restored partition:	2470	-	36 MB - 2470 MB	
Please specify size of free space before the partition:	0		0 MB - 2434 MB	
Please specify size of free space after the partition:	0	1	0 MB - 2434 MB	

• **Drive letter assignment after restore**. The pull-down list contains vacant drive letters that can be associated with the restored partition.

Partition Restore Options		
Assign the following drive letter:	F:	

Restoring Hard Disk:

- **Copy data and resize partitions proportionally**. If this option is activated, the program proportionally changes the size of partitions keeping their relative order intact. The option can be useful when restoring to a larger hard disk.
- Perform surface test. Define whether the surface test will be accomplished during the operation or not.

All contents on the disk selected for restoring purposes will be deleted during the operation.

Result

The wizard will restore the archived data, and make it available to use in the operating system.

To make Windows bootable on different hardware, please additionally complete the <u>P2P</u> <u>Adjust OS Wizard</u>.

Available operation scenarios:

- <u>Restoring a hard disk from the bootable Backup Capsule</u>
- <u>Restoring a system partition from external media (CD/DVD)</u>
- <u>Restoring a system partition from a network drive</u>
- Restoring a system partition from a local drive
- Restoring a dual boot Mac from an external USB drive
- <u>Restoring a file increment</u>
- <u>Restoring a file increment to a partition backup</u>
- <u>Restoring separate files and folders from a backup</u>

Copy Tasks

In this chapter you will find all the information necessary to make a copy of a hard disk or a separate partition.

Cloning Hard Disks

You can clone a hard disk of any file system. During the hard disk copying process, the program moves controlling records of used partitioning scheme, the bootstrap code and on-disk partitions. That's why this operation cannot be substituted by simply copying all on-disk partitions.

Copy Hard Disk Wizard

The Copy Hard Disk Wizard is a traditional-like wizard. By going through its steps, you configure all the necessary settings to launch the copy operation. To minimize the possibility of making any mistake, the wizard provides auxiliary information on every single option. Moreover you can get an in-depth description to any setting, control, or field of the wizard just by clicking the hint button and then the object you need.

You need at least two hard disks to carry out this operation.

Startup

• In the Main Menu: select Wizards > Copy Hard Disk...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Setup

The wizard offers the following steps to accomplish the copy hard disk operation:

• The hard disk to copy. Select a hard disk you want to copy.

O Local Disk (C:) 499.9 GB NTFS Basic Hard Disk 1 (VMware, VMware Virtual, S SCSI Disk Dev)		VMware Virtual S SCSI Disk Dev)
Basic Hard Disk 1 (VMware, VMware Virtual S SCSI Disk Dev)		
	asic Hard Disk 1 (VMware,)	VMware Virtua S SCSI Disk Dev)

• The target hard disk. Select a hard disk (if several) where all data of the source disk will be copied to.

Select a target hard disk. All data from the source hard disk will be copied there. During copy operation, target disk content will be **deleted**.

asic Hard Disk 0 (VMwa	re VMware Virtual S SCSI Disk Dev)
🕘 Local Disk (C:)	Basic Hard Disk 0 (VMware, VMware Virtual S SCSI Disk Dev)

• Copy parameters. The wizard enables to specify the following options:

Choose copy options that suit best your task: Copy options: HDD raw copy Partitions raw copy Resize options: Remove free blocks between partitions Copy data and resize partitions proportionally Copy data and resize partitions proportionally Mark the checkbox to proportionally change the size of partitions while keeping their relative order intact. Tip: This can be very convenient when migrating to a larger hard disk.

Copy options

- **HDD** raw copy to copy the hard disk in the sector-by-sector mode, thus ignoring its information structure (e.g. unallocated space or unused sectors of existing partitions will be processed as well). This can help to avoid problems with hidden data created by certain applications or the system administrator. However, it will take more time to accomplish the operation.

- **Partition raw copy** to copy the on-disk partitions in the sector-by-sector mode to successfully process unknown file systems. However it is not recommended to enable this option when working with supported file systems as it takes more time to accomplish the operation.

- **Change masks for files to exclude from copy** to manage contents of the resulted duplicate. By default the program will take into account exclude filters set in the <u>Settings</u> dialog. If you need to change them, please mark the checkbox and specify additional filters on the next page of the wizard.

Resize options

- **Remove free blocks between partitions** not to keep blocks of free space between partitions on the targeted hard disk.

- **Copy data and resize partitions proportionally** to make the program proportionally change the size of partitions keeping their relative order intact. The option can be useful when upgrading the hard disk to a larger one.

Verification options

This section allows you to define whether the **Surface** and/or the **Writing verification** tests will be accomplished during the operation.

Result

After the operation is completed, you receive a fully functional duplicate of the existing hard disk.

To make Windows bootable on different hardware, please additionally complete the <u>P2P</u> <u>Adjust OS Wizard</u>.

Available operation scenarios:

Migrating system to a new HDD (up to 2.2TB in size)

Cloning Partitions

You can duplicate partitions to protect oneself from downtime in case of a system malfunction or for cloning sample partitions. The program enables to duplicate all partition data including files, the exact structure of directories and file system metadata (location of files, security information, access quotas, etc.).

The Copy Partition Wizard will help you copy a partition of any file system. To minimize the possibility of making any mistake, the wizard provides auxiliary information on every single option. Moreover you can get an in-depth description to any setting, control, or field of the wizard just by clicking the hint button and then the object you need.

Startup

• In the Main Menu: select Wizards > Copy Partition...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Setup

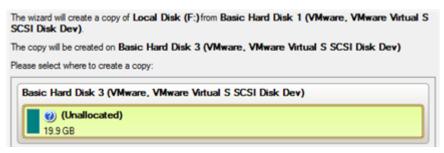

The wizard offers the following steps to accomplish the copy partition operation:

• **The partition to copy**. Select a partition you want to copy.

On this page you can choose a volume to copy.

Basic Hard Disk 0 (VMware,	VMware Virtual S SCSI D	sk Dev)	
Local Disk (C:) 499.9 GB NTFS			
Magazara and a second additional			
Basic Hard Disk 1 (VMware,	VMware Virtual S SCSI D	isk Dev)	

• Destination disk. Select a hard disk with enough unallocated space to perform the operation.

The program enables to copy a partition to a block of free space, which is smaller than the partition itself, taking into account only actual amount of data.

• Copy parameters. The wizard enables to specify the following options:

78

Your hard disk after changes:	
Basic Hard Disk 3 (VMware, VMware Virtual	S SCSI Disk Dev)
(Unallocated) 3.5 GB 16.4 GB	
Where to place a copy	
Please specify the size of the new partition:	3624 🔮 39 MB - 20,473 MB.
Please specify size of free space before the partition:	0 MB - 20,434 MB.
Please specify size of free space after the partition:	16849 🔄 0 MB - 20,426 MB.

- Partition size. Define the size (in Mb) of the copied partition.

- **Free space before**. Define the position (in Mb) of the copied partition relative to the beginning of the available range of disk space.

- **Free space after**. Define the amount of trailing free space (in Mb) at the end of the available range of disk space.

Partition size and position may also be defined by using the drag-and-drop technique. To do that, just carry out the required operation on the Disk Map.

Result

After the operation is completed you receive a fully functional duplicate of the existing partition.

To make Windows bootable on different hardware, please additionally complete the <u>P2P</u> <u>Adjust OS Wizard</u>.

Boot Management

Our program enables to easily manage several operating systems on one computer with the help of the Boot Manager Setup Wizard. Among the key features of the wizard the following should be mentioned:

- Up to 16 operating systems on one PC;
- Secure adding/removing of the Boot Manager startup record to/from the MBR;
- Auto Boot option to automatically start up the previously chosen OS after a certain time period;
- Hiding of any primary partition except selected at the moment.

Startup

• In the Main menu: select Tools > Setup Boot Manager...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Setup

The wizard offers the following steps to accomplish the operation:

• Boot menu options. In this section you can switch between the following modes:

- **Normal mode**. Choose this mode to display the boot menu every time the computer starts up and define a timeout on the expiry of which the program will automatically select the previously chosen item of the menu.

- **Hidden mode**. Choose this mode not to display the boot menu until pressing a hot key. For this mode you should define a hot key used to enable the Boot Manager and a time period in seconds the startup message will be displayed.

Boo	t menu options		
0	Normal mode		
	Timeout for booting last used configuration:	15 seconds	-
0	Hidden mode		
	Time to display the BootManager startup message:	15 seconds	4
	Choose a hot key for startup BootManager:	F1	+

• **Deactivating/Configuring the Boot Manager**. These two options will only be available once the wizard has been completed and launched again. Select the Deactivate option to remove the Boot Manager from the MBR (Master Boot Record) or Configure to modify the previously set parameters of the startup process.

0	Configure
	Choose this option to enter Settings page. You will be able to configure BootManager appearances and Boot Menu options.
0	Deactivate
	Choose this option to deactivate BootManager. This will remove BootManager and restore boot process to its previous state.

Result

After the Boot Manager Setup Wizard is completed the program updates the original record in the MBR to get control of the booting process and to be able to display the boot menu.

Available operation scenarios:

<u>Creating Dual Boot Systems</u>

Partition Management

In this chapter you will find all the information necessary to carry out partitioning operations supported by the program.

Basic Partitioning Operations

Here you can learn how to accomplish basic partitioning operations (create, format, delete).

Creating Partitions

The program provides the ability to create a new partition within a block of un-partitioned space.

Restrictions

- 1. Do not use the Create Partition function in order to undelete the last deleted partition.
- 2. The program allows creating new partitions only within blocks of un-partitioned space. It cannot convert a free space on an existing partition to a new partition.

3. The program cannot create new partitions on Dynamic Disks.

Express Create Partition Wizard Startup

• In the Main menu: select Wizards > Express Create Partition...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Create Partition Wizard Startup

• In the Main menu: select Wizards > Create Partition...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Dialog Startup

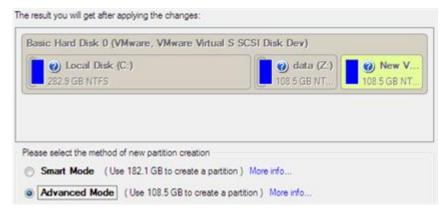

- 1. Select a block of free space on the Disk Map;
- 2. Select in the Main Menu: **Partition > Create Partition**.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Express Create Partition Wizard Setup

Thanks to a highly intelligent work algorithm, the wizard requires minimal involvement in the operation, thus you only need to choose a method you find the most suitable to create the partition (if several available), which actually differ in the amount of space to allocate. For easy perception, you can see the resulted disk layout on the disk map by selecting this or that mode.

The number of available methods depends on your disk layout.

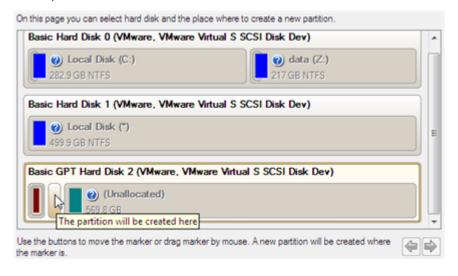

To learn more on the way the wizard works, please click the corresponding link on the first

page of the wizard.

Create Partition Wizard Setup

The wizard offers the following steps to accomplish the operation:

 Partition destination. Select a hard disk (if the computer has several hard disks) and then choose position for the future partition on the disk: at the end (preferable), at the beginning or somewhere in the middle between other partitions.

By default, the program allows you to create a new partition only as the last primary or as the last logical drive within the extended partition. However, by activating the advance mode on the first page of the wizard you can remove this restriction that in its turn might result in some boot problems.

• **Partition size**. There is no restriction on size of the future partition, merely depending on space available on the hard disk.

If there is not enough free space in one block, the wizard enables to redistribute free space, joining all free space blocks together into one united block and moving partitions when necessary. If the total amount of free space is still not enough, it is possible to split a fragment of space from one of the existing partitions, thus resizing it.

Basic GPT Hard Disk 2 (VMware, VMware Virtu	al S SCSI Disk Dev)
(Unallocated) 569.8 GB	
our hard disk after the changes:	
Basic GPT Hard Disk 2 (VMware, VMware Virtu	al S SCSI Disk Dev)
Local Disk (*)	
569.8 GB Not formatted	
New volume - current size is 569.8 GB	
Min Volume Size: 0 Bytes	Max Volume Size: 569.8 GB

If a partition to resize is locked and cannot be processed, the wizard makes the system reboot to create the partition and then automatically boots the system again. (The rebooting mechanism is different for different versions of Windows.)

You can also choose whether the future partition will be primary or logical by marking the appropriate checkbox.

• **Partition properties**. On the next page of the wizard you can set a number of additional parameters:

Basic G	PT Hard Disk 2 (VMware, VMware Virtual S SCSI Disk Dev)	
	New Volume (E:) 569.8 GB NTFS	
artition type	: CNTFS	
	I: New Volume	

- **Partition type**. From the pull-down list select a file system the newly created partition will be formatted to, otherwise the partition will remain unformatted (so that it will not be ready to use).

- **Volume label**. Enter a label for the selected partition in this textual field. It is an irrelevant parameter usually used for drive identification.

- **Surface test level**. Define the level of the surface check to make the program find bad and unstable sectors and mark them unusable in the file system metadata.

Dialog Setup

Initially the program suggests some consistent values for all parameters. In most cases, you can just press the Yes button to confirm the operation.

Are you sure you want to create a new partition on disk 3? You are about to create a new partition in (Unallocated), 19.9 GB area. Please select size, position and file system of the new partition.
Basic Hard Disk 3 (VMware, VMware Virtual S SCSI Disk Dev)
Create new partition as: Primary partition
Please specify new partition size: 20479 🐑 7 MB - 20,479 MB
Please specify size of free space before the partition: 0 🔶 0 MB - 20,465 MB
Please specify size of free space after the partition: 0 🔅 0 MB - 20,472 MB
Please select file system for new partition: NTFS
Please enter new volume label: New Volume
Please specify drive letter: H:
S More options Yes No

- **Define whether the partition will be Primary, Extended or Logical**. You can choose the desired partition type from the pull-down list. As a matter of fact, the available alternatives fundamentally depend on the selected block of free space within the Logical free space, only Logical partitions can be created; Within the Primary free space, both Primary partitions or the Extended Partition can be created.
- Partition Size. Define the size (in Mb) of the new partition.
- Free space before. Define the position (in Mb) of the new partition relative to the beginning of the block of free space.
- Free space after. Define the amount of trailing free space (in Mb) at the end of the new partition.

Partition size and position may also be defined by using the drag-and-drop technique. To do that, just carry out the required operation on the Disk Map. The virtual operations are to be available.

- **File system for new partition**. From the pull-down list select a file system the newly created partition will be formatted to, otherwise the partition will remain unformatted (so that it will not be ready to use).
- Volume label. Enter a label for the selected partition in this textual field. It is an irrelevant parameter usually used for drive identification.
- **Drive letter assignment**. The pull-down list contains vacant drive letters that can be associated with the newly formatted partition.

In addition, there is the possibility to make further detailed settings (although the default values will do in most cases). To activate the advance mode, you need to click the More options button at the foot of the dialog page. Depending on the chosen file system, the following options become available:

83

Use OS built in format routine		
Please select number of sectors per cluster:	8	
Please select number of sectors per boot:	8	
Please select number of root entries:	0	
Restore defaults		

- Use OS built-in routine. Mark the option to restrict the available values according to the used OS.
- Whether the surface test will be performed. Define the level of the surface check to make the program find bad and unstable sectors and mark them unusable in the file system metadata.
- **The amount of sectors per boot**. This parameter is available exclusively for FAT16 and FAT32 file systems. Set the number of sectors to be reserved for the boot area on the partition with this spinner control.
- **The amount of root entries**. This parameter is available exclusively for FAT16 file system. Set the maximum amount of files/directories to be placed in the Root Directory on the FAT16 partition.
- The amount of sectors per cluster. Define the Cluster Size for the formatted partition with this spinner control.

Number of available options depends on the selected file system type.

Result

After the operation is completed you receive a fully functional partition.

Available operation scenarios:

• Creating a new partition to detach operating system from the rest of data

Formatting Partitions

Any partition should contain some file system to be used for keeping data. The process of installing a file system is commonly known as formatting. A huge variety of file systems have been developed these days.

Supported File Systems

The program provides the ability to format partitions of the following file systems:

- FAT12 & FAT16
- FAT32
- HFS+
- NTFS
- Ext2
- Ext3
- Ext4
- Linux Swap v. 2

Wizard Startup

• In the Main menu: select Wizards > Format Partition...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Dialog Startup

- 1. Select a partition on the Disk Map;
- 2. Select in the Main Menu: **Partition > Format Partition**.

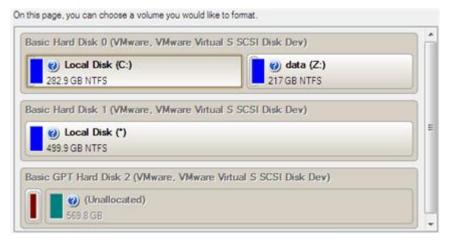

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Wizard Setup

The wizard offers the following steps to accomplish the operation:

• **Partition to format**. Select a hard disk (if the computer has several hard disks) and then the required partition to format.

As a result of this operation contents of the selected partition will be lost.

• Partition properties. On the next page of the wizard you can set the following partition parameters:

86

asic Hard Disk 0 (VMware, VMware	Virtual S SCSI Disk Dev)
Local Disk (C:) 282.9 GB NTFS	e data (Z:) 217 GB NTFS
ition type: SNTFS	

- **Partition type**. From the pull-down list select the desired file system type. In fact, the program displays only those file systems that can correctly be placed to the selected partition, taking its capacity into account.

- **Volume label**. Enter a label for the selected partition in this textual field. It is an irrelevant parameter usually used for drive identification.

- **Drive letter assignment**. The pull-down list contains vacant drive letters that can be associated with the newly formatted partition.

In addition, there is the possibility to make further detailed settings (although the default values will do in most cases). To activate the advance mode, you need to mark the appropriate option at the foot of the page. When it is marked, the next page enables to define:

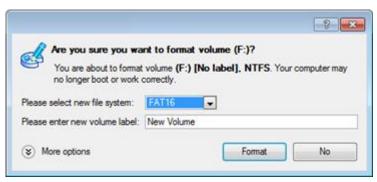

- Use OS built-in routine. Mark the checkbox to restrict the available values according to the used OS.
- Whether the surface test will be performed. Define the level of the surface check to make the program find bad and unstable sectors and mark them unusable in the file system metadata.
- **The amount of sectors per boot**. This parameter is available exclusively for FAT16 and FAT32 file systems. Set the number of sectors to be reserved for the boot area on the partition with this spinner control.
- **The amount of root entries**. This parameter is available exclusively for FAT16 file system. Set the maximum amount of files/directories to be placed in the Root Directory on the FAT16 partition.
- The amount of sectors per cluster. Define the Cluster Size for the formatted partition with this spinner control.

Number of available options depends on the selected file system type.

Dialog Setup

Initially the program suggests some consistent values for all parameters. In most cases, you can just press the Format button to confirm the operation.

- **File system**. From the pull-down list select the desired file system type. In fact, the program displays only those file systems that can correctly be placed to the selected partition, taking its capacity into account.
- Volume label. Enter a label for the selected partition in this textual field. It is an irrelevant parameter usually used for drive identification.

In addition, there is the possibility to make further detailed settings (although the default values will do in most cases). To activate the advance mode, you need to click the More options button at the foot of the dialog page. Depending on the chosen file system, the following options become available:

Use OS built in format routine		
Please select number of sectors per cluster:	128	
Please select number of sectors per boot:	0	(A) (V)
Please select number of root entries:	0	A

Restore defaults

- Use OS built-in routine. Mark the checkbox to restrict the available values according to the used OS.
- Whether the surface test will be performed. Define the level of the surface check to make the program find bad and unstable sectors and mark them unusable in the file system metadata.
- **The amount of sectors per boot**. This parameter is available exclusively for FAT16 and FAT32 file systems. Set the number of sectors to be reserved for the boot area on the partition with this spinner control.
- **The amount of root entries**. This parameter is available exclusively for FAT16 file system. Set the maximum amount of files/directories to be placed in the Root Directory on the FAT16 partition.
- The amount of sectors per cluster. Define the Cluster Size for the formatted partition with this spinner control.

Number of available options depends on the selected file system type.

Result

After the operation is completed you receive a fully functional partition formatted to the specified file system.

Deleting Partitions

Wizard Startup

• In the Main menu: select Wizards > Delete Partition...

Copyright© 1994-2011 Paragon Software Group. All rights reserved.

87

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Dialog Startup

In order to start the operation you should take the following steps:

Launcher

- 1. Select a partition on the Disk Map;
- 2. Select in the Main Menu: Partition > Delete Partition.

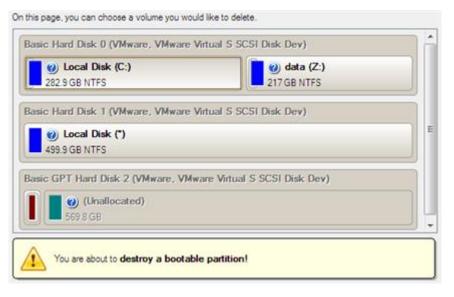

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Wizard Setup

The wizard offers the following steps to accomplish the operation:

• **Partition to delete**. Select a hard disk (if the computer has several hard disks) and then the required partition to delete.

 Merge free blocks. As a result of the operation you may get several blocks of the unallocated space on the hard disk. So choose whether to merge them all and place at the beginning of the disk or at the end by selecting the required operation from the pull-down list.

Merge free blocks options	
Do not merge free blocks	-
Merge free blocks at the end of the disk	
Do not merge free blocks	
Merge free blocks at the beginning of the disk	

Dialog Setup

Initially the program suggests you just to remove references to the selected partition from the Partition Table.

ter may
No

- Enter the volume label to confirm deleting. To confirm deletion of the selected partition, enter its Volume Label. The current volume label is displayed above.
- Do not ask volume label next time. Mark the option to inhibit confirmation next time you start the dialog.

Result

By default, the operation takes only a fraction of a second. However, the program waits until Windows completes the modification of the disk layout.

Advanced Partitioning Operations

Here you can learn how to accomplish advanced partitioning operations.

Merging Partitions

The Merge Partitions Wizard enables to consolidate the disk space, which originally belongs to two adjacent partitions, into a single, larger partition. The order, in which two partitions have been chosen, is important since all contents of the second selected partition will be placed in a folder on the resulted joined partition.

The program provides the ability to merge only NTFS, FAT16 or FAT32 partitions.

Startup

• In the Main menu: select Wizards > Merge Partitions...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Setup

The wizard offers the following steps to accomplish the operation:

• **The partition to expand**. Select a partition, the size of which you need to increase by up-taking contents of an adjacent partition.

	expanded to include adjacent partition. Please note that it is is. You will not be able to proceed further if no adjacent
Basic Hard Disk 0 (VMware, VMware Virt	ual S SCSI Disk Dev)
Local Disk (C:) 282.9 GB NTFS	217 GB NTFS

• **The partition to merge with**. Choose the second partition for the merge operation, the contents of which will be placed in a folder on the resulted joined partition. By default, the program offers an easy-to-understand folder name to store files of the second partition, which however can be customized.

asic Hard Disk 0 (VMware, VMw	vare Virtual S SCSI Disk Dev)
Local Disk (C:) 282.9 GB NTFS	() data (Z:) 217 GB NTFS
282.9 GB NTFS	217 GB NTFS

Be particularly careful when selecting system partitions to process, since the incorrect order, in which two partitions have been chosen, will result in inability to boot the operating system.

Result

After the operation is completed the disk space of the two adjacent partitions will be consolidated.

Redistributing Unused Space between Partitions

Express Resize Partitions Wizard

The Express Resize Partitions Wizard enables to easily increase free space on one partition by up-taking the unused space of an adjacent partition of your hard disk.

Startup

• In the Main menu: select Wizards > Express Resize Partitions...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Setup

The wizard offers the following steps to accomplish the operation:

• Adjacent partitions to resize. Click on the left partition of the pair of partitions you need to redistribute the unused space between, as the right one will be selected automatically.

• **Resulted size of partitions.** Redistribute the unused space between the partitions with the slider or manually by entering the required value.

(C:) 282.9 GB NTFS	data (Z:) TGB NTFS
eft volume size:	Right volume size:

Result

After the operation is completed the unused space between the specified partitions will be redistributed according to your needs.

Available operation scenarios:

- Increasing size of a system partition by taking unused space of an adjacent logical partition
- <u>Resizing partitions of Apple Boot Camp</u>

Redistribute Free Space Wizard

The Redistribute Free Space Wizard helps to increase free space on one partition by up-taking the on-disk unallocated space and the unused space of other partitions. By default, the wizard adds to the target partition all existing blocks of the free space. Besides you can specify partitions to act as a space donor. The wizard will automatically recalculate positions of the partitions and move their contents to new locations.

Startup

• In the Main menu: select Wizards > Redistribute Free Space...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

The wizard offers the following steps to accomplish the operation:

• **Partition to enlarge**. Select a partition, the size of which will be increased at the expense of other partitions. Blocks of the free space (if any) will be automatically added to the target partition.

217 GB NTFS

• **Partition to donate**. Choose any partition(s) (not only adjacent) to donate free space.

Select volumes to take space from. Free space from that volume will be used to enlarge the volume you have selected on the previous page.

Volume	File system	Туре	Capacity	Used space	Free space	% Free
🖾 🕞 (Z:)	NTFS	Primary	217 GB	14.6 GB	202.3 GB	94
ar is Souler and the first of	n far len far len fra fra Medica far fra					
	d space on the hard d					
volume (C:) at the exp free space from it.	pence of some other vo	olumes. Pl	ease click th	e check box ne	ed to any volum	ne to tak

• **Partition size**. By default, the program leaves 50% of the unused space on a partition and removes another 50% to add it to the target partition. However, the size to take can be customized by moving the slider or by manually entering the exact value.

Result

After the operation is completed free space of the specified partition will be increased by up-taking the on-disk unallocated space and the unused space of other partitions.

Undeleting Partitions

When simply deleting a partition (without additional wiping) disk management software only removes references to it in the Partition Table, thus leaving the possibility to recover it later.

The program enables to find and recover these partitions. A restored partition will be fully functional, as long as other partitions were not created, moved or exceeded the disk space occupied by that partition. That is why the program offers this function only for blocks of free space.

The operation can be accomplished with the Undelete Partition Wizard.

Startup

• In the Main Menu: select Wizards > Undelete Partitions...

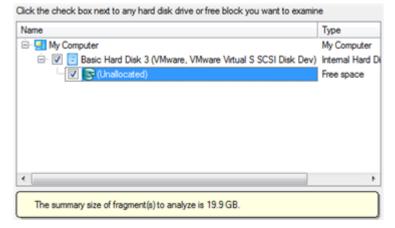

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Setup

The wizard offers the following steps to accomplish the undelete partition operation:

• Free blocks to scan for lost partitions. Choose a free block from a tree-like list of available hard disks.

Search method. By default, the wizard selects the fastest search method for your operating system. In most cases that will do to find any accidentally deleted partition. However if you're under Windows XP for instance (the Conventional Search option is selected), but the deleted partition you're looking for has been created with the Disk Management utility under Vista, the wizard won't be able to find this partition, unless you manually select the appropriate option (Quick Search for Partitions Created by Vista or Later OS). Moreover if the wizard still fails to find the partition you need, you can select the Thorough Search option to scan every single sector in the specified search area to get the most accurate results.

Choose how to look for the deleted partitions:

- Quick search for partitions, created by Vista or later OS
- Conventional search
- Thorough search
- Show file systems search options

Copyright© 1994-2011 Paragon Software Group. All rights reserved.

To know more on the available search methods, please use the context sensitive hint system.

• **File system filter**. By default, the wizard will search for all known file systems. However, by clicking on the appropriate option on the second page of the wizard, you can specify only those file systems you need.

• A partition to undelete (if several). By default, the program searches records of any deleted partition ever existed on the selected block of free space. So you can get several partitions to choose from.

Searce Searce	ch deleted partit	ions from secto	r: 40 to sector 27	##.
The following p	artitions have b	een found:		
File system	Туре	Capacity	Used Space	% Used
NTFS	Primary	19.9 GB	86.3 MB	0
Stop search				

Most likely the required partition will be found first. If so, you may abort the search operation by pressing the Stop search button.

Result

After the operation is completed you receive a fully functional partition.

Installing a New Operating System

Getting your computer ready to install a new operating system, especially when it is going to be an additional OS in the system, is a rather complicated task that implies quite a number of operations, from allocating space to create a new partition (resize, redistribution of free space) to formatting of the newly created partition to a particular file system and checking its surface for bad sectors to avoid possible data loss. Operating systems today are being supplied with basic tools of partitioning that only enable to create a partition (in case there is enough unallocated space on the disk) and then format it to the specified file system type. Our program offers a handy Install New OS Wizard to easily carry out all the necessary operations to install a new operating system.

Startup

• In the Main menu: select Wizards > Install New OS...

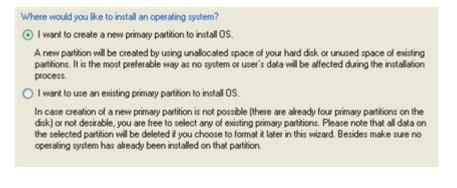

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Setup

The wizard offers the following steps to accomplish the operation:

• **Partition to install a new operating system**. The program offers two ways of installing a new OS, i.e. to create a new primary partition for it or use an existing one.

Only primary partitions can be used to install an operating system.

- In case the first option has been marked, the wizard enables to specify:

A hard disk (if several) where a new partition will be created. Thanks to an advanced program engine it is possible to use unallocated space of the disk (if any) and unused space of existing partitions to create a new partition;

asic Hard Disk 0 (Maxtor 7Y250P0)		
(*) 193.9 GB NTFS	Total size: 193.9 GB) [3.7
asic Hard Disk 1 (ST3160815AS)	Used: 77.2 GB Free: 116.7 GB	
(D:) 19	E:)	

To avoid any possible problems, the new partition will in no way be created as the first partition of the disk which already contains at least one partition.

And its size. If there are blocks of the free space on the disk, the wizard will merge them all and allocate the resulted space for a new partition in the first place. If not, it will take 50% of the unused space of an adjacent partition. However, the size to take can be customized by moving the slider.

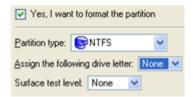

- In case the second option has been marked, the wizard enables to choose an existing primary partition to install a new operating system.

Basic Hard Disk 0 (Maxtor 7Y250P0)	1	
(1) 30	2	(U 33.7 GB
Basic Hard Disk 1 (ST3160815AS)	Total size: 163.3 GB Used: 77.2 GB Free: 86.1 GB	
(D:) 19 63.4 GB NTFS	66 GB NTES	

Your computer may fail if any other OS has already been installed on the selected partition.

Partition properties.

- **Partition type**. From the pull-down list select the desired file system type. In fact, the program displays only file systems that can be correctly placed to the selected partition, taking its capacity into account.

- **Drive letter assignment**. The pull-down list contains vacant drive letters that can be associated with the newly formatted partition.

- **Surface test level**. Define the level of the surface check to make the program find bad and unstable sectors and mark them unusable in the file system metadata.

 OS Label. Enter a label for the selected partition in the textual field. It will later be used for the drive identification.

OS labels system.	will be displayed in the Boot Manager's startup menu to help you boot the required operating
OS label:	Windows 7

As the final step the wizard will offer you to insert a distributive CD/DVD of the new operating system and restart the computer to launch the installation procedure.

The program will update your MBR, so most likely you won't be able to start up any of the previously installed operating systems. Please launch the Boot Manager Setup Wizard after the installation has been completed to fix this issue.

Available operation scenarios:

• Creating Dual Boot Systems

Moving/Resizing Partition

The Move/Resize Partition function allows you to resize or change location of any partition without destroying its data. In order to move/resize a partition you should take the following steps:

- 1. Select a partition on the Disk Map.
- 2. Select in the Main menu: Partition > Move/Resize Partition...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

3. Define parameters of the operation.

Local Disk (C:) 282.9 GB NTFS	
282.9 GB NTFS	
Volume size: 289,776 MB 👳 🖬 11,923 MB - 28	9.781 MB
Free space before: 0.97 MB 🔄 🕢 0 bytes - 277.85	0.73 MB
Free space after: 4.85 MB 🕸 💌 0 bytes - 277.85	50.76 MB

- Volume size. Define size (in Mb) of the modified partition.
- Free space before. Define the partition position (in Mb) relative to the beginning of the available range of disk space.

- Free space after. Define the amount of trailing free space (in Mb) at the end of the available range of disk space.
- Sector to sector move. Mark the checkbox to move the partition in the sector-by-sector mode to process its unused space as well. This can help to avoid problems with hidden data created by certain applications or the system administrator. However, it will take more time to accomplish the operation.

Partition size and position may also be defined by using the drag-and-drop technique. To do that, just carry out the required operation on the Disk Map. The virtual operations are to be available.

When resizing a FAT16 partition beyond the 2GB limit (maximum file system size), the partition will automatically be converted to FAT32.

The program enables to enlarge NTFS partitions (system, locked) without rebooting Windows and interrupting its work, providing 100 percent guarantee that your data is kept intact.

4. The operation will be performed immediately after confirmation.

Available operation scenarios:

- Increasing size of a system partition by taking unused space from any other
- Shrinking a system partition to increase size of a data partition

Converting File System

With our program you can change type of the used file system without destroying its data. While performing the operation, it first checks the current file system for consistency and then verifies whether the on-partition data meet the requirements of the desired file system or not. After having passed the testing, the program re-organizes the file system metadata and user files.

The program enables to convert the following file system types:

- FAT16 > NTFS, FAT32
- FAT32 > NTFS, FAT16
- NTFS > FAT16, FAT32
- Ext2 > Ext3

In order to convert a file system you should take the following steps:

- 1. Select a partition on the Disk Map.
- 2. Select in the Main menu: Partition > Convert file system...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

3. Initially the program suggests some consistent values for all parameters. In most cases, you can just press the Convert button to confirm the operation.

				-9-1	×
🗞 Are you sure you	want to co	nvert sy	ystem volu	ne (C:)?	
You are about to co Your computer may				lo label], NTFS	
Please select new file system	FAT32	¥			
Select new cluster size:	8				

- **New file system**. From the pull-down list choose a file system you would like to convert to. Actually the program only displays variants available for the operation, taking into account the current parameters of the selected partition and limitations of the used file system.
- New cluster size. Define the cluster size for the partition. This parameter can have a profound effect on the overall performance. In a nutshell, larger clusters waste more space, but generally provide for slightly better performance, because of less fragmentation. So be particularly careful with it.

The cluster size value is expressed in sectors per cluster. To get it in Kbytes, please divide it into half.

You may only decrease the current cluster size.

- **Surface test level**. Define the level of the surface check to make the program find bad and unstable sectors and mark them unusable in the file system metadata.
- 4. The operation will be performed immediately after confirmation.

Changing Cluster Size

Cluster size is one of the crucial parameters of any file system. Its value implicitly affects the performance of the files input-output activity since it defines the size of the file system metadata. Besides, the so-called waste space factor also depends on the cluster size.

In order to change the cluster size of a partition you should take the following steps:

- 1. Select a partition on the Disk Map.
- 2. Select in the Main menu: Partition > Modify > Change Cluster Size...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

 Define the cluster size for the partition. This parameter can have a profound effect on the overall performance. In a nutshell, larger clusters waste more space, but generally provide for slightly better performance, because of less fragmentation. So be particularly careful with it.

The Cluster Size value is expressed in Sectors Per Cluster. To get the Cluster Size in Kbytes, divide it into half.

4. The operation will be performed immediately after confirmation.

Making Logical/Primary

The program allows you to include a primary partition in the extended partition, or exclude a logical partition from the extended partition, without partition duplication.

In order to change a partition type you should take the following steps:

- 1. Select a primary or logical partition on the Disk Map.
- 2. Select in the Main menu: Partition > Modify > Make Partition Logical/Primary.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

The Make Primary > Logical option is only available when the selected partition is adjacent to the extended partition and vice versa.

The Make Primary > Logical option of the system partition will result in inability to boot the operating system.

3. The operation will be performed immediately after confirmation.

Changing Partition Attributes

This chapter explains how you can change partition attributes (Active flag, Hidden flag, Volume Label, etc.).

Mark Partition Active/Inactive

The program enables to set an active/inactive flag for primary partitions of a hard disk. By default, an operating system will boot only if its partition is active or bootable.

In order to mark a partition active/inactive you should take the following steps:

- 1. Select a primary partition on the Disk Map.
- 2. Select in the Main Menu: **Partition > Mark Partition as Active/Inactive**.

3. The operation will be performed immediately after confirmation.

There can only be one active partition on a hard disk, otherwise your operating system will fail to boot.

Hide/Unhide Partition

The program allows you to hide/unhide primary and logical partitions. By default, an operating system does not mount hidden partitions, thus preventing access to their contents.

In order to hide/unhide a partition you should take the following steps:

- 1. Select a partition on the Disk Map.
- 2. Select in the Main Menu: Partition > Hide/Unhide Partition.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

3. The operation will be performed immediately after confirmation.

It is strongly recommended not to hide the system partition. Otherwise your operating system will fail to boot.

Set Label of a Partition

The Partition Label is a small textual field (up to 11 characters) that is located in the partition's boot sector. It is detectable by any partitioning tool and is used for notification purposes only.

In order to change a partition label you should take the following steps:

- 1. Select a partition on the Disk Map.
- 2. Select in the Main Menu: Partition > Modify > Change Volume Label.

3. Enter a label for the selected partition.

4. The operation will be performed immediately after confirmation.

Change Partition ID

Partition ID is a file system identifier. It is saved in the Partition Table and is used to quickly detect a partition of the supported type. By manually changing its value, you can manipulate accessibility of partitions.

In order to change a partition ID you should take the following steps:

- 1. Select a partition on the Disk Map.
- 2. Select in the Main Menu: Partition > Modify > Change Partition ID...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

3. Set a new ID for the selected partition.

Are you sure you want to ch	ange system ID of the partition (F:)
	5. Changing system ID might prevent some
operating systems from working w	
Please select predefined ID from the I	81:)
0x07 NTFS	
Please enter ID manually:	
07 🔄	
	Yes No

- **Predefined ID**. Select from the pull-down list the required ID.
- Enter ID manually. With the spinner control set the required ID value. It has to be a 1-2 digit hexadecimal number.
- 4. The operation will be performed immediately after confirmation.

Change Serial Number of a Partition

FAT16, FAT32, and NTFS file systems include the Serial Number parameter. A partition's serial number is saved in the boot sector. Its value is generated while formatting.

The program enables to modify the serial number parameter for FAT16, FAT32, or NTFS partitions without reformatting.

In order to change a serial number you should take the following steps:

- 1. Select a partition on the Disk Map.
- 2. Select in the Main Menu: Partition > Modify > Change Serial Number.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

3. Enter a new serial number for the selected partition. It should contain 8 hexadecimal figures (0..9 or A..F). The operation cannot proceed until you enter all 8 symbols.

4. The operation will be performed immediately after confirmation.

Hard Disk Management

In this chapter you will find all the information necessary to carry hard disk operations supported by the program.

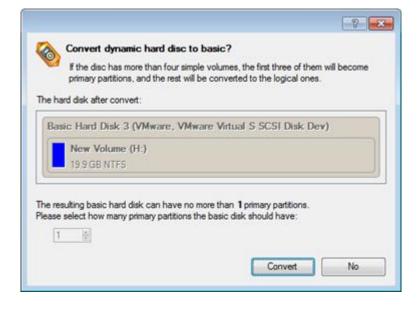

Converting Dynamic MBR to Basic

The program allows you to convert a dynamic MBR disk containing simple volumes into a basic one while keeping its contents intact.

In order to convert a dynamic MBR disk into basic you should take the following steps:

- 1. Select a dynamic MBR disk containing simple volumes on the Disk Map.
- 2. Select in the Main Menu: Hard Disk > Convert to Basic...
- 3. Set the required number of primary partitions if necessary. According to the DOS partitioning scheme a hard disk can have up to four Primary partitions. If there is an Extended partition on the disk, only three primary partitions are allowed. That is why if a dynamic disk contains several simple volumes the program enables to

choose the number of primary partitions. The rest of them if any will automatically be converted to logical disks within the Extended partition.

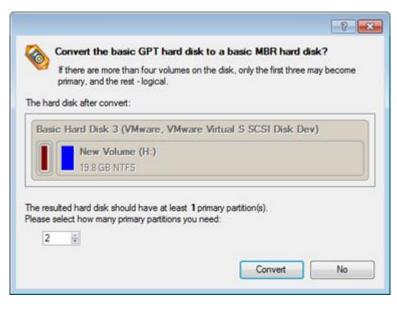

The program can only process dynamic disks containing solid simple volumes (without extension).

Converting GPT to Basic MBR

The program allows you to convert a basic or a dynamic GPT disk containing simple volumes into a basic MBR disk while keeping its contents intact.

In order to convert a basic or a dynamic GPT disk into a basic MBR disk you should take the following steps:

- 1. Select a basic or a dynamic GPT disk containing simple volumes on the Disk Map.
- 2. Select in the Main Menu: Hard Disk > Convert to Basic MBR Hard Disk...
- 3. Set the required number of primary partitions if necessary. According to the DOS partitioning scheme a hard disk can have up to four Primary partitions. If there is an Extended partition on the disk, only three primary partitions are allowed. That is why if a GPT disk contains several volumes the program enables to choose the number of primary partitions. The rest of them if any will automatically be converted to logical disks within the Extended partition.

Converting Basic MBR to GPT

The program allows you to easily convert a basic MBR disk into a basic GPT disk while keeping its contents intact. The operation is quite safe for the on-disk data, but you should know that only 64-bit Windows OSes since Vista are able to boot from this type of disks. So if you've got a 32-bit Windows OS accommodated on a disk you'd like to convert to GPT, it won't start up after the operation is over.

In order to convert a basic MBR disk to a basic GPT you should take the following steps:

- 1. Select a basic MBR hard disk on the Disk Map.
- 2. Select in the Main Menu: Hard Disk > Convert to GPT hard disk.

3. The operation will be performed immediately after confirmation.

Updating MBR

The program enables to overwrite the current bootable code in the MBR (Master Boot Record) by the standard bootstrap code. This can help to repair a corrupted bootable code of a hard disk resulted from a boot virus attack or a malfunction of boot management software.

105

106

In order to update MBR of a hard disk you should take the following steps:

Launcher

- 1. Select a hard disk on the Disk Map.
- 2. Select in the Main Menu: Hard Disk > Update MBR.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

3. The operation will be performed immediately after confirmation.

Changing Primary Slot

Different operating systems apply different approaches to enumeration of the primary partitions.

In Linux:

In Linux, every partition has a special symbolic name that encodes a hard disk containing a partition, and a partition itself. Partitions are addressed and accessed by using their symbolic names. Symbolic names are automatically generated by Linux in accordance with the order of hard disks in BIOS and the order of partition records in the Partition Table. Thus changing enumeration of the primary partitions can lead to changing of paths to some important resources.

In DOS:

The last versions of MS-DOS use a rather sophisticated algorithm for a drive letter assignment. A drive letter, which is assigned to a partition, depends on the order of records in the Partition Table. Thus changing enumeration of the primary partitions affects the drive letters assignment. In early versions of MS-DOS, it could even lead to the unavailability of a partition.

The program provides the ability to change enumeration of the primary partitions. This feature will allow you to fix problems concerning an inappropriate order of partitions.

In order to modify enumeration of the primary partitions you should take the following steps:

- 1. Select a hard disk on the Disk Map.
- 2. Select in the Main Menu: Hard Disk > Change Primary Slot.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

(VMw	re about to change primar rare, VMware Virtual boot correctly.			
Slot No	Object type	File System	n Vo	olume label
)	Primary	FAT32	and the second second	o label]
	Primary	NTFS		o label]
2	Primary Primary	Linux Ext3 Linux Swap		W VOLUME
	1. 11	1	17.3	
	Name:	Local Disk	(F:)	
	Volume label:		12000000	
	Total size:	2.4 GB	File syste	m: NTFS
	Used space:	36.3 MB	Free space	ce: 2.3 GB
-	Start sector:	7261380	End sect	or: 12321854

- 3. In the opened dialog you can see the current enumeration of the primary partitions of the selected hard disk in the Partition Table. To help you distinguish partitions from one another, the program provides the following parameters for every partition:
 - Slot
 - Volume
 - Partition type
 - File system
 - Partition size
 - Volume label

There are two buttons on the right to move the selected partition up and down within the primary part of the Partition Table.

4. The operation will be performed immediately after confirmation.

Wipe Tasks

In this chapter you will find all the information necessary to wipe a hard disk/partition of any file system or only destroy any remnants of deleted files/directories left on disk without affecting the used data, thus providing high level of security.

The operation can be accomplished with the Wipe Wizard or corresponding dialogs.

Wizard Startup

• In the Main Menu: select Wizards > Wipe Hard Disk or Partition...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Wizard Setup

The wizard offers the following steps to accomplish the operation:

• The hard disk/partition to wipe. Select a hard disk/partition the data of which you want to destroy.

Please choose an object for wiping, it can be a whole hard disk, a single partition or a block of unallocated space. You can set to wipe all data on the partition or only unoccupied space on it (see the next step).

Local Disk (C:)	() data (Z:) 217 GB NTFS	
282.9 GB NTFS		
Basic Hard Disk 1 (VMware, VMware Vir	tual S SCSI Disk Dev)	
🕑 Local Disk (*)		
499.9 GB NTFS		
Basic GPT Hard Disk 2 (VMware, VMwa	re Virtual S SCSI Disk Dev)	
Unallocated)		
569.8 GB		

• Wipe mode. This section enables to switch between two options:

0	Wipe out all the data
	Choose this option if you want to destroy completely all the data on the selected object.
	Clear (wipe) free space
	Choose this option if you want to destroy the traces of data that may have been left after an ordinary delete operation.

- Wipe out all data. Select the option to irreversibly destroy all on-disk data of the selected object.

- **Clear (wipe) free space**. Select the option to destroy any remnants of deleted files/directories left on disk without affecting the used data.

The Clear Free Space operation is available only for Logical and Primary partitions of known file systems.

• Wipe method. Here you can select a specific data erasure algorithm or create a customized method by marking the appropriate option.

- In case you preferred to use a specific algorithm, the next page of the wizard enables to get detailed information on the selected algorithm, choose whether to carry out residual data verification or not specifying the percentage of sectors to check and estimate the time required to accomplish the operation.

Wipe met	thod
US I	DoD 5220.22-M
Overwrite	all addressable locations with a character, its complement, then a random character and verify.
	sses count: 3
Verify par	sses count: 1
Verif	y wipe results
Percenta	age of sectors to check: 100 👘
pproximat	e wipe time: 14:02:40
	You can skip verifying completely or partly by disabling it or reducing percentage of sectors to check. Please note, it would be a deviation from US DoD 5220.22-M.

The list of supported military and government standards may vary for your product.

In case you preferred to create a customized algorithm, the next page of the wizard enables to define up to 4 wiping patterns, number of passes for each wiping pattern and for the group of patterns. The Mask spinner control allows you to set a two-figure hexadecimal character value ("00" by default). The available range is from "00" to "FF". You can also choose whether to carry out residual data verification or not specifying the percentage of sectors to check.

Wipe param	eters				
📝 Mask:	00	0	Pass count:	1	1
🔄 Mask:	00		Pass count:	1	
Mask:	00		Pass count:	1	
Mask:	00	4	Pass count:	1	
Pass count	for the	group	of patterns:	1	1
🕅 Verfy v	vipe rea	sults			
Percentage	of sec	tors to	check: 1	1	8

• **Revise your changes**. This page informs on all the actions to be made in the wizard in a bright, graphical form.

Your hard	disk b	efore ti	he d	hanges:	
Basic	Hard	Disk	0 (V	Mware.	VMwar

Basic Hard Disk 0 (VMware, VMware Virtual S SCSI Disk Dev)	
Your hard disk after the changes: Basic Hard Disk 0 (VMware, VMware Virtual S SCSI Disk Dev) (Unallocated) 499.9 GB	

Wizard Result

After the operation is completed you can see a well informative summary page, providing structurally divided in-depth information on all the actions made in the wizard.

The program also enables to store the resulted report. To do that, just press the Save button and choose the exact location in the opened dialog.

To make sure that all on-disk data is irreversibly destroyed call the Disk Viewer dialog by clicking the appropriate tab and see it for yourself.

The Summary page will be available only when the Virtual operations are disabled.

Available operation scenarios:

• Hard Disk Utilization

Task Scheduling

Automation of operations can really help you out when you've got to accomplish certain routine operations on a regular basis as it enables to execute them without your involvement while optimizing your computer's work-load.

Setting a Timetable

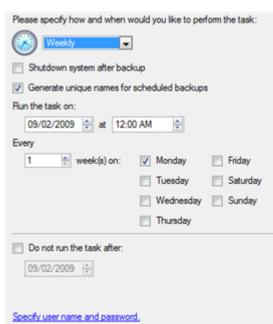

Thanks to the embedded Scheduler, you can set a timetable for execution of any operation. It has two categories for time settings (these correspond to appropriate items in the Schedule type menu):

- Initiating the operation by an event:
 - One time only (i.e. the Once item)
 - When the system starts (i.e. the At System Startup item)
 - When the user logs on (i.e. the At Logon item).
- Initiating the operation periodically (i.e. Daily, Weekly, Monthly).

Please specify how and when would you like to perform the task:

Once	
Once	
Shu At System Start	up up
Ger At Logon	scheduled backups
Run the Weekly	
09 Monthly	4 (e)

You need to select one of the variants. Depending on your choice, the scheduler displays a form that enables to set a timetable.

To run the task in the log-off mode, please specify administering login info by following the appropriate link in the left lower corner of the page.

The Shutdown System on Complete option enables to automatically switch off the computer on the successful accomplishment of the operation.

Managing Tasks

All scheduled tasks are placed in a separate list, which can be retrieved by clicking the Scheduled Tasks tab in the Explorer Bar:

Disk View	Scheduled Tasks	Archives	Help	
Scheduled Ta	asks 🔄 📴 🗟			
Name	Scr	pt		When to Run
Backup of	MBR of hard disk 0 scr	02090912474	4490.psl	At 12:00:00 AM every Mon, of every week, starting 9/2/2009.

On every task you can get in-depth information, including:

- The task name
- The full path to the generated script of the task
- Scheduled time of launch
- Statistics on the last launch
- Scheduled time of the next launch
- Used account information
- Comments to the task

To easily manage tasks, the program enables to arrange them according to a certain characteristic just by clicking on the required property.

This feature can be particularly beneficial when the Scheduled Tasks list contains too many items.

You can also enable/disable, rename, delete, refresh or modify properties of the selected task.

Task Editor

With the Task Editor you can easily modify properties of scheduled tasks. To do that, you should take the following steps:

- 1. Select a task on the Scheduled Tasks list.
- 2. Click the Properties button on the Scheduled Tasks list.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

🗞 Task Properties:	Backup of MBR of hard disk 0
General Sched	ule
Program: Script: Comments:	C:\Program Files\Paragon Software\Drive Backup 10 Server Edition\program\scripts.exe n Files/Paragon Software/Drive Backup 10 Server Edition/scripts/scr_020909124744490.psl Edit Browse Backup has been scheduled: 9/2/2009 5:47:44 AM
✓ Enabled	
1	OK Apply Cancel

- 3. In the opened dialog window you can see two tabs General and Schedule. Click the General tab to modify:
 - Full path to the macro-command program-interpreter, which describes the scheduled task;
 - Command line for starting the interpreter (i.e. the task described in macro-language)
 - Comments referring to the task
 - The option of enabling/disabling the task.

By clicking the Schedule tab you can modify the task timetable.

In order to apply the changes, you need to click the Apply button at the foot of the dialog.

Creating a Scheduled Task

You can set a timetable for execution of any operation. For backup and copy operations the program offers handy wizards, while all the others can be scheduled with the Save to Scheduler dialog.

To create a scheduled task you should take the following steps:

- 1. Make sure the virtual mode of execution is enabled;
- 2. Carry out with the program all operations you need to schedule;
- 3. Call the Save to Scheduler dialog in the Main Menu: Tools > Save to Scheduler...;

	E	8
م ^م ک	chedule virtual operations? Il virtual operations you have made will be saved to the scheduler. No operatio pplied.	ns will be
	e: Scheduled Task	
0	ecify how and when would you like to perform the task:	
	Daily 📃 📰	
Shuto	lown system after carrying out the tasks	
Run the ta	isk on:	
09/02	2/2009 🐑 at 12:00 AM 🔅	
Every		
1	aay(s)	
📄 Do no	t run the task after:	
0.9/02	2009 (金)	
Specify u	er name and password.	
	rd all operations on close	No

- 4. In the opened dialog enter the required task name and specify the task timetable;
- 5. The operation will be performed immediately after confirmation.

Scripting

The program actions can also be represented in form of a script. The script describes the appropriate operation with macro-language commands. There is an interpreter utility - SCRIPTS.exe, which is included in the program installation package. This utility works in the unattended mode, which enables to automate operations.

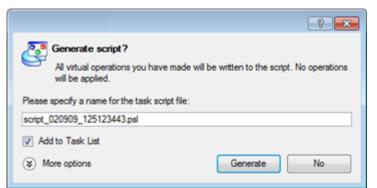

Startup

You have no need to write a script since the program has a convenient interface for such a task. In order to generate a script on the base of the entered parameters of the required operation, you should take the following steps:

- 1. Make sure the virtual mode of execution is enabled;
- 2. Carry out with the program all operations you need to be scripted;
- 3. Call the Generate Script dialog in the Main Menu: Tools > Generate Script....

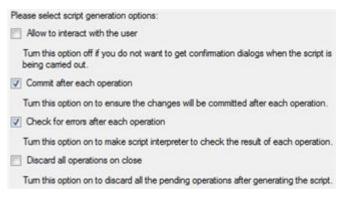

Setup

Initially the program suggests some consistent values for all parameters. In most cases, you can just press the Generate button to confirm the operation.

• Script file name and location. By default, the program offers to add the script to the Task List with a name containing its creation date and time. Unmark the Add to Task List checkbox to define an exact location and a filename for the script file. The default file extension that is reserved for scripting files is .psl, which however can be modified.

In addition, there is the possibility to make further detailed settings (although the default values will do in most cases). To activate the advance mode, you need to click the More options button at the foot of the dialog page, so you will be able to define:

- Interaction with the user. Mark the option to pause the script interpreter during the execution to prompt the user's confirmation or other input. Otherwise the program will not stop using default values for parameters if needed.
- Commit after each operation. Mark the option to commit changes after each operation.
- **Check for errors after each operation**. Mark the option to insert a special code in script, which checks the status of the last executed operation and stops the script processing if there are errors of any kind.
- **Discard all operations on close**. Mark the option to empty the List of Pending Operations after generating the script.

Result

After the operation is completed you receive a new script file. It is placed into the specified destination, its features defined in the dialog.

This command is unavailable if there are no operations on the List of Pending Operations. To learn more about scripts please consult the Paragon Scripting Language manual.

Extra Functionality

This chapter describes the supplementary functionality available in the program.

View Partition/Hard Disk Properties

The program enables to obtain in-depth information on the properties of hard disks and partitions. Besides the general information, such as capacity, used space or file system type it provides the possibility to get info on hard disk geometry, cluster size, exact partition location, etc.

To get properties on a partition/hard disk, please do the following:

- 1. Choose a partition/hard disk on the Disk Map.
- 2. Select in the Main Menu: Partition/Hard Disk > Properties...

neral	File System Info Advanced		
.002	I Disk (C:)		
	(
		1	
	Volume label:	[No label]	
	File system:	NTFS	
	Type:	Primary	
	Capacity:	499.9 GB	
		536.868.814.848 Bytes	
		1,048,571,904 Sectors	
	Used by data:	9.3 GB (1%)	
		10,016,497,664 Bytes	
		19,563,472 Sectors	
	Free space:	490.6 GB (99%)	
	20000000000000000000000000000000000000	526,852,317,184 Bytes	
		1.029.008.432 Sectors	

In the opened dialog information will be grouped according to its properties, thus by clicking tabs you can get information you need.

Volume Explorer

Volume Explorer is a special tool to browse and export contents of the local mounted/unmounted volumes formatted to FAT16, FAT32, NTFS, Ext2FS, Ext3FS, ReiserFS file systems. Besides it enables to access Paragon backups as regular folders to explorer their contents or to retrieve certain files.

To launch the Volume Explorer you should click **Disk View** tab in the Explorer Bar and then choose **Volume Explorer**:

Available operation scenarios:

<u>Restoring separate files and folders from a backup</u>

File Transfer Wizard

File Transfer Wizard is designed to make such operations as copying of separate files/directories or burning of them to CD/DVD as easy and convenient as possible. It may be of particular use in case of a system malfunction, caused either by a virus attack or files corruption, in order to get the system back on track again. Besides it provides access to Paragon backups as regular folders to browse through their contents or copy required files.

Startup

• Select in the Main Menu: Tools > File Transfer Wizard.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Setup

The wizard offers the following steps to accomplish the transfer operation:

• Place to look for files/directories. Select a source disk from the pull-down list in the left pane of the page. The program enables to process both mounted and unmounted (without drive letter assigned) partitions. Besides it is possible to map a network drive.

Local Disk (C:)	R	🖾 💥	2
E Local Disk (C-)	~1		
N ODVD RW Drive (D:)			
E E Local Disk (E:)			-
E Local Disk (F:)			
Archives (G:)			
New Volume (H:)	Е		
Physical partitions			
NEW VOLUME, Disk 1			
Network places		5	
Network	-		

• **Object(s) of operation**. Choose files/directories you want to copy and place them to Clipboard by pressing the Add button. To delete a file/directory from the Clipboard, select it in the Clipboard pane and press the Remove button. You can also create a new folder, rename or irreversibly delete existing files/directories of the left pane by pressing the appropriate buttons.

Clipboard	Source
Name Source Path	🔚 Local Disk (F:) 💽 🤯 💥 🛃
images F:/images/	Name Images Images Images Images Images
Total data siz	ze: 132.8 KB

Files/directories deleted from the Clipboard remain intact on source disks.

Destination to store the object(s). The File Transfer Wizard allows copying data to local or network drives, to
physical partitions (without drive letters assigned), or burning them to CD/DVDs. Choose the way the data will
be stored.

Th	ere are several ways the Wizard can store your data. Plese select how would you like to save the data:
0	Save data to local/network drives.
	Overwrite existing files
0	Save data to physical partitions.
O	Burn the data to CD or DVD.

Revision of changes. The Transfer Summary page provides structurally divided information on all the actions
made in the wizard. Check the changes and come back to any step of the wizard (if necessary) by following the
required hyperlink.

119

Please overview the transfer options. You can return to the corresponding page and change the options by clicking on title hyperlinks.

Objects to transfer	
Object(s) selected:	1
Total data size:	132.8 KB (136,024 Bytes)
Transfer destination	
Destination path:	C:/
Space available on destination:	490.6 GB (526.821.834,752 Bytes)
Overwrite existing files:	No

Result

After the operation is completed the required data will be placed into the specified destination.

Available operation scenarios:

- <u>Copying of data from the corrupted system disk to another hard disk</u>
- Burning of data from the corrupted system disk to CD/DVD
- <u>Copying of data from a backup to the corrupted system partition</u>
- <u>Restoring separate files and folders from a backup</u>

Mount Partition

The program enables to assign or remove drive letters of existing formatted partitions.

Assign Drive Letter

In order to mount a partition you should take the following steps:

- 1. Select a partition on the Disk Map.
- 2. Select in the Main Menu: Partition > Assign Drive Letter...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

3. Specify a drive letter for the selected partition. Initially the program suggests some consistent value for this parameter. So you may just press the Yes button to confirm the operation.

However you can manually define the required letter by selecting it from the pull-down list of available drive letters.

4. The operation will be performed immediately after confirmation.

Remove Drive Letter

In order to un-mount a partition you should take the following steps:

- 1. Select a partition on the Disk Map.
- 2. Select in the Main Menu: **Partition > Remove Drive Letter**.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

3. The operation will be performed immediately after confirmation.

Modifying drive letter of the system partition will result in inability to boot the operating system.

After having processed partitions with installed software, some programs may not run properly.

Downgrade NTFS Version

With our program you can decrease version of an existing NTFS partition. This feature can be particularly useful when, for instance, dealing with different versions of the Windows NT family operating systems.

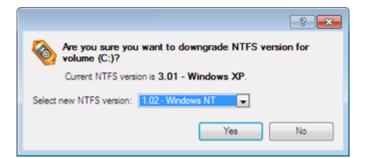

In order to start the operation you should take the following steps:

- 1. Select a partition on the Disk Map.
- 2. Select in the Main menu: Partition > Modify > Downgrade NTFS Version...

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

3. Decrease version of the selected NTFS partition by selecting the one you need from the pull-down list.

4. The operation will be performed immediately after confirmation.

Mount Archive

The program provides the ability to assign a drive letter to a partition backup image. As a result of the operation you will get a new read-only partition in the system to easily browse through its contents and copy the required information even with the standard Windows tools.

Assign Drive Letter

In order to mount an archive you should take the following steps:

- 1. Select a backup image in the Archive Database.
- 2. Select in the Main Menu: **Archives > Mount the Selected Archive**.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

3. Specify a drive letter for the selected backup image. Initially the program suggests some consistent value for this parameter. So you may just press the Yes button to confirm the operation.

However you can manually define the required letter by selecting it from the pull-down list of available drive letters.

4. The operation will be performed immediately after confirmation.

The current version of the program allows the user to mount archives of separate partitions only.

There is no possibility to mount archives located on physical (unmounted) partitions or in the bootable capsule.

Archives will only be mounted for the current session and won't be available after the system restart.

It is strongly recommended not to un-mount backup images with Windows Disk Manager or other third side software.

Remove Drive Letter

In order to un-mount a backup image you should take the following steps:

- 1. Select a backup image in the Archive Database.
- 2. Select in the Main Menu: Archives > Unmount the Selected Archive.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

3. The operation will be performed immediately after confirmation.

Test Surface

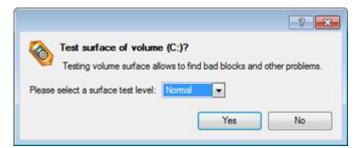

The program enables to test surface of existing partitions and blocks of free space for bad or unstable sectors. If found any it automatically marks them unusable in the file system metadata, thus minimizing the risk of data loss.

In order to start the surface test you should take the following steps:

- 1. Select a partition or a block of free space on the Disk Map.
- 2. Select in the Main Menu: Partition > Test Surface...

3. From the pull-down list choose the level of the surface check.

4. The operation will be performed immediately after confirmation.

Check File System Integrity

The program allows you to check integrity of a file system. It can be used to detect possible file system errors before performing any operation on a partition.

To start the system integrity check you should take the following steps:

- 1. Select a partition on the Disk Map.
- 2. Select in the Main Menu: Partition > Check File System Integrity

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

	Check volume (C:) [No label], NTFS for	errors?	
0	Please note that check operation needs exclusi asked to restart your computer to complete the o		lume. You may be

3. The operation will be performed immediately after confirmation.

Check Archive Integrity

The program provides the ability to check integrity of a backup image. The function allows distinguishing between valid and corrupted images before using them. The Check Archive Integrity Wizard will help you do that.

Startup

• In the Main Menu: select Wizards > Backup Utilities > Check Archive Integrity...

Setup

The wizard offers the following steps to accomplish the operation:

• An archive to verify. The Browse for Archive page enables to find a backup image you need.

By clicking the Switch to Archive List View link, you can see a list of images contained in the Archive Database (if any).

Edit/View Sectors

With the built-in Edit/View Sectors tool the program enables to view/edit sectors on existing partitions/hard disks providing the possibility to directly access and modify sectors, save and restore sectors from specified files, navigate through the system metadata, etc.

In order to edit/view sectors of a hard disk/partition you should take the following steps:

- 1. Select a hard disk/partition on the Disk Map.
- 2. Select in the Main Menu: Partition/Hard Disk > Edit/View Sectors.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

Careless use of the Edit Sectors function may result in the irreversible data corruption.

Send Log Files

The program enables to simplify the procedure of sending support requests to the Paragon Support Team. In case of having difficulties with handling the program, you, with the help of this very function, can address the company support engineers and provide them with all the information they need such as the disk layout, performed operations, etc. in order to tackle the encountered problem. Information of that kind is stored in Log files.

In order to send log files to the Paragon Support Team you should take the following steps:

1. Call the Send Log Files dialog in the Main Menu: Tools > Send Log Files;

- 2. Provide a customer name and a product serial number;
- 3. Give a detailed description on the encountered problem.

Send log files
Send log files. Please enter short description of your problem and send log files to support. Customer Name:
John Smith
Serial Number:
09fde-654ec-a49fc-7daf8-237a2
Content of inquiry:
Help!
Send Cancel

By clicking the Send button the built-in mail client will generate a template request with attached compressed log files and then send it to the Paragon Support Team.

Log Files

Log files are simple textual files that can be opened by any text editor. There are several log files automatically generated by the program:

Stubact.log	Contains in-depth information on parameters and performance of all operations carried out by the program
Pwlog.txt	Besides brief overview on operations it also contains detailed information about the state of all hard disks
Cdb.log	Contains low-level information on the CD/DVD devices used in the system
BioNTlog.txt	It is an OS-dependent supplementary log file derived from Bioxx.dll. It may contain valuable information on Windows family operating systems

Log files do not contain any confidential information on the operating system settings or the user documents.

The Send Log Files function is only available when outgoing mail server (SMTP) and the user e-mail address are properly set. To learn more about it please consult the <u>Settings</u> <u>Overview chapter</u>.

View Logs

With a handy dialog you can study logs on any operation carried by the program. To make this job as easy as possible, all the information is structurally divided, besides there is the possibility to see the disk layout before and after an operation, what is very convenient.

In order to view logs on carried out operations select in the Main Menu: Tools > View Log Files

Typical Scenarios

This chapter lists a number of the most frequently used scenarios that may be accomplished with the program. You can find here useful recommendations and descriptions of operations.

Backup Scenarios

Creating the Backup Capsule

Let us take a computer of a rank and file user who is most likely to have only one hard disk with only one partition (the only partition is always system). Suppose that there is enough free space on the hard disk to create the backup capsule as well. It can be created with the Manage Backup Capsule Wizard:

1. Click the Manage Backup Capsule item of the Wizards menu.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

- 2. On the Wizard's Welcome page, click the Next button.
- 3. Select a place on the disk where the backup capsule will be created. It can be created as a primary partition or as a logical drive within an extended partition. It can be inserted into any place on the hard disk: at the end (preferable), at the beginning or somewhere in the middle between other partitions.

Basic Hard Disk 0 (VMware, VMware Virtual S SCSI Disk Dev)	
) Local Disk (C:)	
499.9 GB NTFS	
Basic Hard Disk 2 (VMware, VMware Virtual S SCSI Disk Dev)	
Archives (G:)	
79.9 GB NTFS	

On this page you can select a hard disk where a backup capsule will be created as well as the relative

By default, the program allows the user to create the backup capsule only as the last primary or as the last logical drive within the extended partition. However, by activating the advance mode on the first page of the wizard you can remove this restriction that in its turn might result in some boot problems.

4. Set the size for the backup capsule. It will be created at the expense of free space of the selected disk.

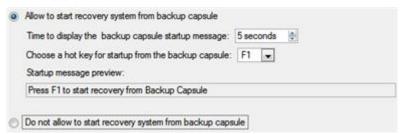

There is no restriction on the size of the backup capsule, merely depending on the available space of the hard disk and the capacity needed for the backup.

If the wizard cannot find enough free space in one block, it will redistribute free space, joining all free space blocks together into one united block and moving partitions if necessary. If the total amount of free space is still not enough, it is possible to split a fragment of space from one of the existing partitions, thus resizing it.

If the partition is locked and cannot be resized, the wizard makes the system reboot to create the backup capsule and automatically boots the system again. (The rebooting mechanism is different for different versions of Windows).

5. Activate the bootable recovery environment if needed. With its help you will get the choice to boot directly from the backup capsule for maintenance or recovery purposes every time you start up the computer.

This operation will result in overwriting of the current MBR, thus in case of having a third side boot manager, it will be removed. To avoid that you can save the current MBR with the help of the <u>Edit/View Sectors</u> tool.

The backup capsule can only be bootable if it is located on the bootable device (assigned in the BIOS).

6. Start the operation (by clicking the Next button) or return to correct the settings.

After the operation is completed you can place backup archives into the created backup capsule.

Backing up a hard disk or partition to the Backup Capsule

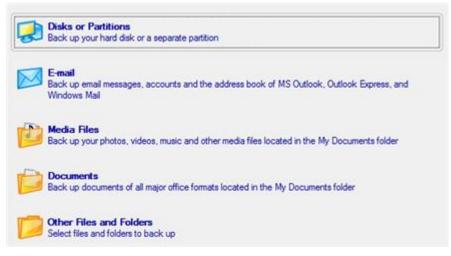

To back up an entire hard disk or a separate partition and then place the resulted image into the backup capsule, please do the following:

- 1. <u>Create the backup capsule</u> with the Manage Backup Capsule Wizard.
- 2. Click the **Smart Backup** item of the Wizards menu.

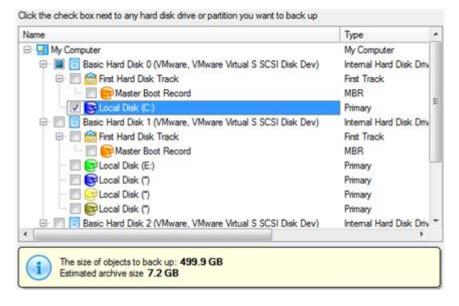

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

- 3. On the Wizard's Welcome page, click the Next button.
- 4. On the What to back up page, select **Disk or Partitions** to create a sector-based backup of the whole disk system, or only separate partitions.

5. On the next page, mark the appropriate option opposite a hard disk's name or a partition's name depending on the chosen task.

You've got the option to modify the default backup settings by marking the appropriate checkbox on this page.

By default the program will take into account exclude filters set in the Settings dialog.

6. On the Backup Destination page, select the Save data to the Backup Capsule option.

There are several ways the Wizard can store your data. Please select how would you like to save the archive:

Save data to the Backup Capsule
Save data to local/network drives.
Save data to physical partitions.
Save data to FTP locations.

- Burn the data to CD or DVD.
- 7. Edit the archive name if necessary.

Please specify the archive name. Archive name will be used as a sub-folder where backup data files will be stored.
Archive details
Archive name: arc_030909071001085
Estimated archive size: 4.4 GB
Space available on backup destination: 38 GB

Please take into account values of the parameters Estimated archive size and Space available on backup destination - if the archive size exceeds the available space, delete outdated backups from the Backup Capsule or resize it with the Manage Backup Capsule Wizard.

8. Add comments to your backup describing its contents.

9. On the Backup Summary page review all parameters of the operation and modify them if necessary. Click the Next button to start the backup process.

This operation can also be accomplished with our recovery media.

Backing up a hard disk or partition to external media (CD/DVD)

To back up an entire hard disk or a separate partition and then burn the resulted image to CD/DVD, please do the following:

1. Click the Smart Backup item of the Wizards menu.

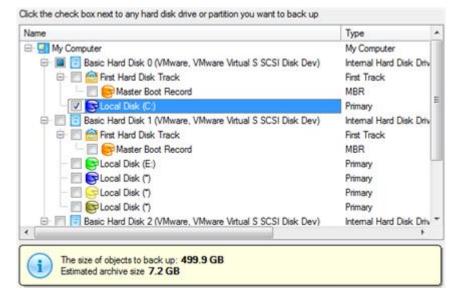

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

- 2. On the Wizard's Welcome page, click the Next button.
- 3. On the What to back up page, select **Disk or Partitions** to create a sector-based backup of the whole disk system, or only separate partitions.

131

4. On the next page, mark the appropriate option opposite a hard disk's name or a partition's name depending on the chosen task.

You've got the option to modify the default backup settings by marking the appropriate checkbox on this page.

By default the program will take into account exclude filters set in the Settings dialog.

5. On the Backup Destination page, select the **Burn the data to CD or DVD** option.

There are several ways the Wizard can store your data. Please select how would you like to save the archive:

 Save data to the Backup Capsule

 Save data to local/network drives.
 Save data to physical partitions.

 Save data to FTP locations.

- Burn the data to CD or DVD.
- 6. Select a recordable device on the list of available CD/DVD devices and edit the archive name, if necessary.

Name		Disc types		
Optiarc DVD RW AD	7170A	CD-R/RW; DVD-R/RW; DVD-RAM; DVD+R/R		
CD Burner Emulator		CD-R/RW		
DVD Burner Emulator		DVD+R/RW		
Archive details				
Archive details				
Archive details Archive name:	BP030909	(No more than 8 symbols and only in English.)		

Please take into account the Estimated archive size value. It can give you a hint about the number of CD/DVD discs required for the operation.

7. Add comments to your backup describing its contents.

8. On the Backup Summary page review all parameters of the operation and modify them if necessary. Click the Next button to start the backup process.

This operation can also be accomplished with our recovery media.

Backing up a hard disk or partition to a network drive

To back up an entire hard disk or a separate partition and then place the resulted image to a network share, please do the following:

1. Click the Smart Backup item of the Wizards menu.

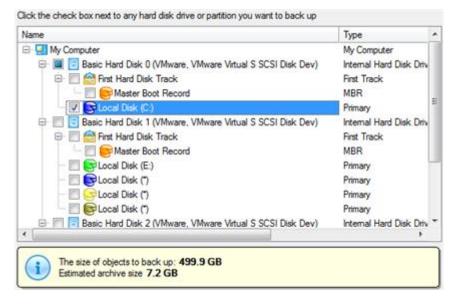

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

- 2. On the Wizard's Welcome page, click the Next button.
- 3. On the What to back up page, select **Disk or Partitions** to create a sector-based backup of the whole disk system, or only separate partitions.

4. On the next page, mark the appropriate option opposite a hard disk's name or a partition's name depending on the chosen task.

You've got the option to modify the default backup settings by marking the appropriate checkbox on this page.

By default the program will take into account exclude filters set in the Settings dialog.

5. On the Backup Destination page, select the Save data to local/network drives option.

There are several ways the Wizard can store your data. Please select how would you like to save the archive:

Save data to the Backup Capsule

- Save data to local/network drives.
- Save data to physical partitions.
- Save data to FTP locations.
- Burn the data to CD or DVD.
- 6. Map a network disk to place your backup image to:
 - Call the Map Network Drive dialog by clicking the appropriate button;

sub-fok	a folder where archive should be placed and specify archive name. Archive na der where backup data files will be stored.			_
Archive	e location: C:/arc_030909071551273/		×	z

6	Remote location mapping A network share : [
€ €-5	Map to drive letter : Z: Make permanent connection			
	Connect as user OK	Cancel		

- Click the standard browse button [...] to browse for the required network share or manually enter a path to it;
- Define a letter from the pull-down list of available drive letters;
- Mark the checkbox to make this connection permanent. Otherwise it will only be available for the current Windows session;
- Click the Connect as user button at the foot of the dialog page to specify a user name and password to access the selected network share if necessary.
- 7. Edit the archive name if necessary.

Please specify the an be stored.	chive name. Archive n	ame will be u:	ed as a sub-folder where backup data files will
Archive details			
Archive name:	arc_03090907100	1085	
Estimated archive	size:	4.4 GB	
Space available or	n backup destination:	38 GB	

Please take into account values of the parameters Estimated archive size and Space available on backup destination - if the archive size exceeds the available space, another network drive needs to be selected.

8. Add comments to your backup describing its contents.

9. On the Backup Summary page review all parameters of the operation and modify them if necessary. Click the Next button to start the backup process.

This operation can also be accomplished with our recovery media.

Backing up files to an FTP/SFTP server

With our program you can protect the entire system, separate partitions, or particular files by backing up directly to online storages located on FTP or SFTP servers. Please note however, that due to certain limitations of the network bandwidth, the use of FTP/SFTP locations for storing many GBs of data (OS together with all on-disk data) isn't the best choice, but it's great for personal data, like your documents, email databases, photos, etc.

So let's see how to back up all office documents of the My Documents folder to an SFTP server:

1. Click the **Smart Backup** item of the Wizards menu.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

- 2. On the Wizard's Welcome page, click the Next button.
- On the What to back up page, select **Documents** to protect all office documents inside the My Documents folder.

4. On the next page, choose **FTP Servers** as backup storage.

Look in: E Local Disk (C:)	
Name	Date
Network Second Action Second Act	7/13/2009 7:37:05 PM
👜 🚺 🤣 FTP Servers	3/22/2011 5:14:05 AM
🕀 🔡 Users	11/19/2009 11:54:19 AM
Windows	3/22/2011 5:09:55 AM
Archive name: arc_230311090030515	

5. Click on the **Create an FPT Location** button to set up parameters for the required SFTP location.

ook in: 🕜 FTP Servers 🔄 🧟 🤡 🙀 🛠	Look in:
ddress: [ftp://	Address:
Name Create FTP/SFTP location	Name
Use SFTP connection	
Address: sftp://sftp.hidrive.strato.com/ Port: 22 Anonymous login Allow OpenSSH key-based authentication	
Login:	
Password: Save password	
Name: STRATO HiDrive	
Connect Cancel	Archiv
o bad	To bad

- Use SFTP connection. Mark the option to connect to the desired SFTP server;

- Address. Type in its address;
- Port. Specify the required port (22 by default);

- **Anonymous login**. Mark the option to set up anonymous connection. Typical username for this type of login is "anonymous";

137

- Allow Open SSH key-based authentication. If your SFTP provider requires this type of authentication, mark the option to specify public and private keys and a passphrase;

Public key file:	Browse
Private key file:	Browse
Passphrase:	

- Login. Enter a login;
- Password. Enter a password. Click Remember password to save it next time you back up to this location;

- **Name**. By default, the program uses the provided address as the connection name, which can be modified however.

You need to check out yourself Windows Firewall or programs of this kind let our program work with the required port (21 for FTP and 22 for SFTP by default).

6. When ready, click the **Connect** button to check out you've got access to the provided location. If yes, you'll get a new item on the list named after this location. By clicking the + icon you can browse it to specify a more exact location for your backup. At this stage you can also edit the default archive name if necessary.

7. Add comments to your backup describing its contents.

8. On the Backup Summary page review all parameters of the operation and modify them if necessary. Click the Next button to start the backup process.

Backing up a dual boot Mac to an external USB drive

To back up a dual boot Mac (Mac OS X and Windows XP/Vista/7) and then place the resulted image to an external USB drive, please do the following:

1. Start up the computer from our Linux/DOS recovery media.

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

- 2. Connect an external USB drive to the computer.
- 3. Restart the computer. It will be automatically started up into the Linux recovery environment (**Normal Mode**), since it's the only mode that provides support for Mac computers.
- 4. In the Linux launch menu select Hard Disk Manager.
- 5. Launch the Backup Wizard by selecting in the Main Menu of the program: Wizards > Backup Wizard.

Add fi	ter Rename category Delete category	

9. Add comments to your backup describing its contents.

10. On the Backup Summary page review all parameters of the operation and modify them if necessary. Click the Next button to start the backup process.

This operation can also be accomplished with our recovery media.

Creating a differential to a full partition backup

To update an image of the selected partition, please do the following:

- 1. Click the **Differential Partition Backup** item of the Wizards menu.
- 2. On the Wizard's Welcome page, click the Next button.
- 3. On the Browse for Archive page, specify the required full (base) partition archive:
 - By clicking the **Switch to Archive List View** link, you can see a list of images contained in the Archive Database (if any).

will

7. Add comments to your backup describing its contents;

Please	enter a short comment to describe the archive
	No comment

8. On the Backup Summary page review all parameters of the operation and modify them if necessary. Click the Next button to start the backup process.

After the operation is completed you receive a differential backup of the selected partition. It is placed into the specified destination (a local or network disk, the Backup Capsule or a CD/DVD disc), its features defined by the wizard.

This operation can also be accomplished with our recovery media.

Creating an increment to a full partition backup

To update only files you need since the last full partition backup, please do the following:

- 1. Click the Create File Complement item of the Wizards menu.
- 2. On the Wizard's Welcome page, click the Next button.
- 3. On the Browse for Archive page, specify the required full (base) partition archive:
 - By clicking the **Switch to Archive List View** link, you can see a list of images contained in the Archive Database (if any).

Add category	

7. Add comments to your backup describing its contents.

Please	enter a short comment to describe the archive
	No comment

8. On the Backup Summary page review all parameters of the operation and modify them if necessary. Click the Next button to start the backup process.

After the operation is completed you receive an incremental backup of the selected partition archive containing information specified in the wizard. It is placed into the same destination as the base image.

Creating an increment to a full file backup

To update a file backup, please do the following:

- 1. Click the Incremental File Backup item of the Wizards menu.
- 2. On the Wizard's Welcome page, click the Next button.
- 3. On the Browse for Archive page, specify the required full (base) file archive:
 - By clicking the **Switch to Archive List View** link, you can see a list of images contained in the Archive Database (if any).

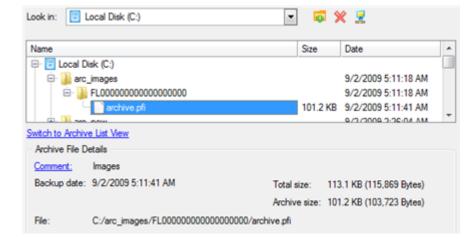

Гуре	Creation Date 🔍	Source Object	Size	Flags	Corr Mounted
	9/2/2009 5:11:41 AM	File-level Archive	113.1 KB	3	I

File:	C:/arc_images/FL00	000000000000000000000000000000000000000	/archive.pfi		

To get a clear-cut picture on properties of the required image, just click on it and the section below will (i.e. Archive File Details) display a short description.

To know more on the subject, please consult the <u>Viewing Image Properties</u> chapter.

• By clicking the **Switch to File View** link, you can find the required image in the browser-like window. The section below (i.e. Archive File Details) will also display a short description of the selected image.

To know more on the subject, please consult the <u>Viewing Image Properties</u> chapter.

After the operation is completed you receive an incremental backup of the selected file archive. It is placed into the same destination as the base image.

Creating a cyclic partition backup

To automate the partition backup process, please do the following:

- 1. Select in the Main Menu: Wizards > Backup Utilities > Cyclic Backup...
- 2. On the Wizard's Welcome page, click the Next button;
- 3. On the What to back up page, select a partition you want to make a cyclic backup of;

Click the check box next to any hard disk drive or partition you want to back up Name Type E My Computer My Computer Basic Hard Disk 0 (VMware, VMware Virtual S SCSI Disk Dev) Internal Hard Disk Driv 🖻 📃 🙆 First Hard Disk Track First Track C Master Boot Record MBR Primary Basic Hard Disk 1 (VMware, VMware Virtual S SCSI Disk Dev) Internal Hard Disk Driv 😑 📃 🙆 First Hard Disk Track First Track 📃 📴 Master Boot Record MBR Cocal Disk (E:) Primary Cocal Disk (*) Primary Local Disk (*) Primary E Local Disk (*) Primary Basic Hard Disk 2 (VMware, VMware Virtual S SCSI Disk Dev) Internal Hard Disk Driv 4 The size of objects to back up: 499.9 GB Estimated archive size 7.2 GB

The current version of the program enables to make a cyclic backup of only one partition at a time.

4. On the Backup Destination page, select a mounted/unmounted partition, a network share, or an FTP server to place backup images to.

rchive location:	G:/arc_030909111312358/	1	1 9	٤ ۽
Name			Size	Date
🖻 🔜 My Compu				
🕀 📴 Local				
E Cocal				
🕀 🔂 Archi	es (G:)			
🗈 🛃 Network				

5. Edit the archive name if necessary.

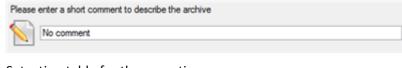

Please specify the archive name. Archive name will be used as a sub-folder where backup data files will be stored. Archive details

Archive name:	arc_030909071007	1085
Estimated archive	size:	4.4 GB
Space available or	backup destination:	38 GB

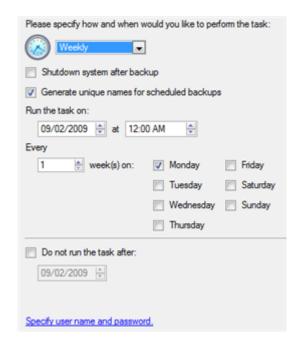

Please take into account values of the parameters Estimated archive size and Space available on backup destination - if the archive size exceeds the available space, another drive needs to be selected.

6. Add comments to your backup describing its contents.

7. Set a timetable for the operation.

To know more on the subject, please consult the <u>Task Scheduling</u> chapter.

8. On the Cyclic backup type page, choose the way of creating a cyclic backup:

- Base type. Every image created during the operation will be made as a full archive.
- **Differential type**. Every first image will be made as a full (base) archive and all the others will be differentiated from it. This operation requires much less space, thus considerably saving your system resources.

By setting the **Maximum disk space to store images** and the **Maximum number of images to store** parameters you may define when the operation will be cycled. That means that on exceeding these two parameters the oldest archives will be automatically overwritten (if choosing the Differential type only differential images will be overwritten).

Maximum disk space to store images:	10000	٥	MB.
Maximum number of images to store:	2	٠	

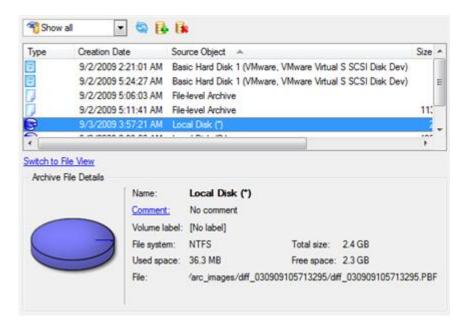

9. On the Backup Summary page review all parameters of the operation and modify them if necessary. Click the Next button to start the backup process.

The operation will run according to the set timetable. The resulted backup images will be placed into the specified destination (a local or a network disk), its features defined by the wizard.

Merging a full partition backup with one of its differentials

To merge a full partition backup with one of its differentials, thus getting a new full partition archive, please do the following:

- 1. Click the Synthetic Backup item of the Wizards menu.
- 2. On the Wizard's Welcome page, click the Next button.
- 3. On the Browse for Archive page, you only need to specify the required differential archive. The program then will automatically find its base image:
 - By clicking the **Switch to Archive List View** link, you can see a list of images contained in the Archive Database (if any).

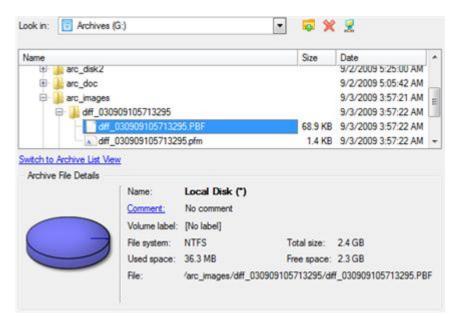

To get a clear-cut picture on properties of the required image, just click on it and the section below will (i.e. Archive File Details) display a short description.

To know more on the subject, please consult the <u>Viewing Image Properties</u> chapter.

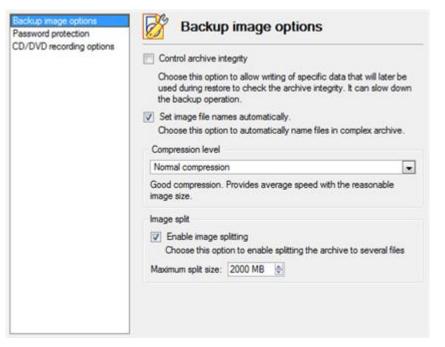

• By clicking the **Switch to File View** link, you can find the required image in the browser-like window. The section below (i.e. Archive File Details) will also display a short description of the selected image.

To know more on the subject, please consult the <u>Viewing Image Properties</u> chapter.

4. On the Synthesis Settings page you can additionally modify any property of the selected backup image if necessary. To accomplish our task we have no need to change anything at all.

5. On the Synthetic Archive Destination page, select where you want to place the resulted backup image.

155

There are several ways the Wizard can store your data. Please select how you would like to save the archive:

- Save data to the Backup Capsule
- Save data to local/network drives.
- Save data to physical partitions.
- Save data to FTP locations.
- Burn the data to CD or DVD.
- 6. Edit the archive name if necessary.

After the operation is completed you receive a new full partition archive. It is placed into the specified destination (a local or network disk, or a CD/DVD disc), its features defined by the wizard.

This function is currently unavailable for modification of entire hard disk backups.

This operation can also be accomplished with our recovery media.

Recovery Scenarios

Fixing MBR after a boot virus attack

Let's assume that the MBR (Master Boot Record) of your hard disk has been corrupted as a result of a boot virus attack, thus your system fails to boot.

To fix the MBR of your hard disk, please do the following:

1. Start up the computer from our Linux/DOS recovery media.

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

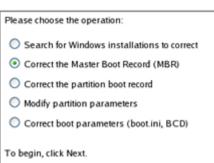

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

2. In the boot menu select Normal Mode to use the Linux recovery environment (more preferable) or Safe Mode to use the PTS DOS recovery environment (in case you've got problems with Linux). Moreover you've got the option to boot into the Low-Graphics Safe Mode (PTS DOS safe mode) to cope with a serious hardware incompatibility. In this case, only the minimal set of drivers will be included, like hard disk, monitor, and keyboard drivers. This mode has simple graphics and a simple menu.

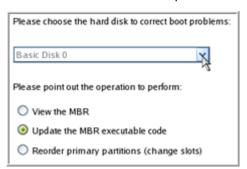

By default the Normal Mode will be automatically initiated after a 10 second idle period.

- 3. In the Linux launch menu select Boot Corrector. You can find it in PTS DOS as well.
- 4. On the Wizard's Welcome page, select the Correct the Master Boot Record (MBR) option.

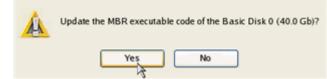

5. On the next page choose the required hard disk from the pull-down list (if several) and then select the **Update the MBR executable code** option.

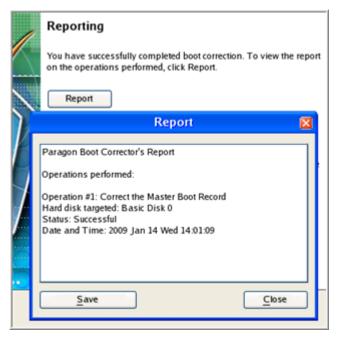

Copyright© 1994-2011 Paragon Software Group. All rights reserved.

6. Confirm the operation.

7. After the operation is completed click the Report button to see a well informative summary page. The program also enables to store the resulted report. To do that, just press the Save button and choose the exact location in the opened dialog.

- 8. Click the Finish button to close Boot Corrector.
- 9. Reboot the computer.

Correcting BCD (Boot Configuration Data)

To automatically correct Windows BCD, please do the following:

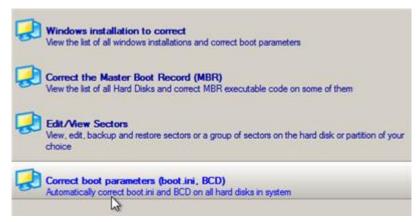

1. Start up the computer from our WinPE recovery media.

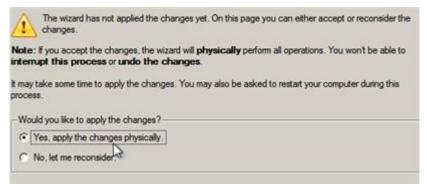

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

- 2. Launch Boot Corrector.
- 3. On the Wizard's Welcome page, click the Next button.
- 4. Select Correct boot parameters... to let the wizard fix BCD in all found Windows installations.

5. The wizard will ask you to confirm the operation. Apply the changes to complete.

After completing the operation close the wizard, and then reboot the computer.

Fixing Windows startup ability

Let's assume that due to an unknown reason your Windows fails to complete the startup procedure. At first everything seems quite OK, you can see the standard startup messages on the screen, but at some moment it hangs up.

To fix your Windows startup ability, please do the following:

1. Start up the computer from our Linux/DOS recovery media.

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

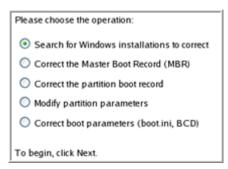

2. In the boot menu select Normal Mode to use the Linux recovery environment (more preferable) or Safe Mode to use the PTS DOS recovery environment (in case you've got problems with Linux). Moreover you've got the option to boot into the Low-Graphics Safe Mode (PTS DOS safe mode) to cope with a serious hardware incompatibility. In this case, only the minimal set of drivers will be included, like hard disk, monitor, and keyboard drivers. This mode has simple graphics and a simple menu.

By default the Normal Mode will be automatically initiated after a 10 second idle period.

- 3. In the Linux launch menu select Boot Corrector. You can find it in PTS DOS as well.
- 4. On the Wizard's Welcome page, select the Search for Windows installations to correct option.

Copyright© 1994-2011 Paragon Software Group. All rights reserved.

5. On the next page choose the required Windows installation from the list of found installations (if several), then select the **Edit the Boot.ini file** option. If you're not sure which installation you need, please use the Properties button to get more info on the selected item.

Correct Windows in	stallati	ons

Restoring a hard disk from the bootable Backup Capsule

Let's assume that your computer fails to boot because of a virus attack or corruption of some system critical files. But you've got the bootable backup capsule containing a backup of your hard disk. That's just enough to easily get your system back on track again.

To restore your hard disk from a backup image contained in the backup capsule when the current OS is down, please do the following:

1. Start up the computer from the bootable backup capsule. By default, the program offers to use the F1 hot key to boot from it.

This scenario implies that the backup capsule is bootable.

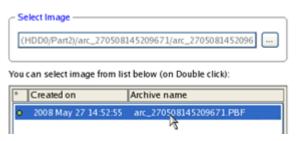

2. In the boot menu select **Normal Mode** to use the Linux recovery environment (more preferable) or **Safe Mode** to use the PTS DOS recovery environment (in case you've got problems with Linux).

By default the Normal Mode will be automatically initiated after a 10 second idle period.

- 3. In the Linux launch menu select the Simple Restore Wizard. You can find the same wizard in PTS DOS as well.
- 4. On the Wizard's Welcome page, click the Next button.

5. On the What to Restore page, you can see a list of available images (if several). Most likely the required archive will be there too. If not, click the standard browse button [...] to find it. When you find your image, double click on it to proceed.

6. On the Image Properties page, make sure that you select the correct image by viewing the provided information about the archive.

3	*:	Primary	Free	17.2 Gb		No	No
R	esize prop	ortionally					

You can also make the program resize the on-disk partitions proportionally if necessary by marking the appropriate checkbox.

All contents on the disk selected for restoring purposes will be deleted during the operation.

8. On the Restore Summary page you can see your hard disk layout before and after the operation. Click the Next button to initiate the restore process.

9. In the Progress window you can see in real-time a detailed report on all actions carried out by the program.

10. After completing the operation close the wizard and reboot the computer.

To make Windows bootable on different hardware, please additionally complete the <u>P2P</u> <u>Adjust OS Wizard</u>.

Restoring a system partition from external media (CD/DVD)

Let's assume that your computer fails to boot because of a virus attack or corruption of some system critical files. But you've got a backup of your system partition on a bootable DVD disc. That's just enough to easily get your system back on track again.

To restore your system partition from a backup image located on CD/DVD when the current OS is down, please do the following:

1. Insert a CD/DVD disc containing the previously prepared backup image into a CD/DVD drive (the BIOS must be enabled to boot the system from the CD/DVD device).

This scenario implies that you have got a bootable archive on your CD/DVD.

In case the backup image is stored on several CD/DVD disks, please insert the first one.

2. Restart the computer.

3. In the boot menu select **Normal Mode** to use the Linux recovery environment (more preferable) or **Safe Mode** to use the PTS DOS recovery environment (in case you've got problems with Linux). Moreover you've got the option to boot into the **Low-Graphics Safe Mode** (PTS DOS safe mode) to cope with a serious hardware incompatibility. In this case, only the minimal set of drivers will be included, like hard disk, monitor, and keyboard drivers. This mode has simple graphics and a simple menu.

By default the Normal Mode will be automatically initiated after a 10 second idle period.

- 4. In the PTS DOS launch menu select the Simple Restore Wizard. You can find the same wizard in Linux as well.
- 5. On the Wizard's Welcome page, click the Next button.
- 6. On the What to Restore page, you can see a list of available images (if several). Most likely the required archive will be there too. If not, click the standard browse button [...] to find it. When you find your image, double click on it to proceed.

7. On the Image Properties page, make sure that you select the correct image by viewing the provided information about the archive.

12. After completing the operation close the wizard, and then reboot the computer.

To make Windows bootable on different hardware, please additionally complete the <u>P2P</u> <u>Adjust OS Wizard</u>.

Restoring a system partition from a network drive

Let's assume that your computer fails to boot because of a virus attack or corruption of some system critical files. But you've got a backup of your hard disk on a remote backup server. That's just enough to easily get your system back on track again.

To restore your system partition from a backup image located on a network drive, please do the following:

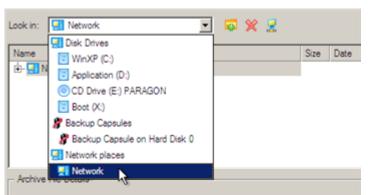

1. Start up the computer from our WinPE recovery media.

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

- 2. Once you accept the agreement, you will see the Universal Application Launcher. Select the Restore Wizard.
- 3. On the Restore Wizard's Welcome page, click the Next button.
- 4. On the Browse for Archive page you need to specify the required backup image. So you should take the following steps to do that:
 - Select Network as a backup destination;

- Map a network disk where your archives are placed:
 - Call the Map Network Drive dialog by clicking the appropriate button;

Look in:	Network	•	ø	×	2			
Name						Size	Date	
÷ 7	Manuale Map Network Drive						?	×
	Remote location mapping							
	A network share :	_	_	_	_			
	Map to drive letter : Z							
	Make permanent connection							
- Arc	 Connect as user 			_	QК		<u>C</u> ancel	

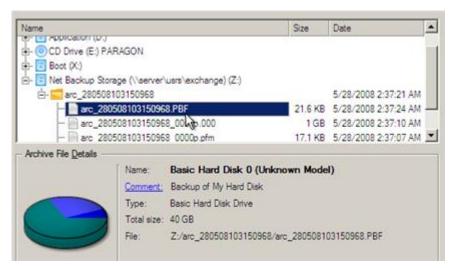

- Click the standard browse button [...] to browse for the required network share or manually enter a path to it;

- Define a letter from the pull-down list of available drive letters;

- Click the Connect as user button at the foot of the dialog page to specify a user name and password to access the selected network share if necessary.

• Choose the required archive in the browser-like window. The Archive File Details section displays a short description of the selected image.

5. The What to Restore page displays detailed information about the contents of the archive. Select the required item to restore. In our case it is the first partition of the disk.

Name		Туре	File sy	stem	Size	Used
Basic Hard Disk 0	(Unknown Mod	el) Basic Hard Disk I	Drive		40 GB

9.7 GB NTFS	9.9 GB	17.2 GB

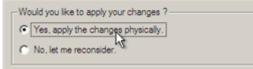

All contents on the partition selected for restoring purposes will be deleted during the operation.

168

7. On the Restore Results page you can see the resulted disk layout. Besides there's the possibility to change size of the partition and its location if necessary as well as assign a particular drive letter.

Basic Hard Disk 0 (VMware Virtual IDE Har	d Drive)
9.9 GB NTFS	p C (Unallocated) 172 GB
ogical Disk Restore Options Please specify the size of the restored partition:	3067 국 1849 MB - 3067 MB
Please specify size of free space before the partition:	
	0 🖨 0 MB + 1217 MB

8. On the next page of the wizard confirm the operation by selecting the appropriate option.

- 9. In the Progress window you can see in real-time a detailed report on all actions carried out by the program. Mark the checkbox at the bottom of the window to automatically switch off the computer on the successful accomplishment of the restore operation.
- 10. After completing the operation close the wizard, and then reboot the computer.

To make Windows bootable on different hardware, please additionally complete the <u>P2P</u> <u>Adjust OS Wizard</u>.

Restoring a system partition from a local drive

Let's assume that your operating system gives trouble after having installed brand new software. But you've got a backup of the system partition on a local disk. That's just enough to easily roll it back to the point when run smoothly.

To restore your system partition from a backup image located on a local disk, please do the following:

1. Click the **Restore** item of the Wizards menu.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

- 2. On the Restore Wizard's Welcome page, click the Next button.
- 3. On the Browse for Archive page, specify the required archive:
 - By clicking the **Switch to Archive List View** link, you can see a list of images contained in the Archive Database (if any).

7. The program will require the system restart to accomplish the operation in a special boot-up mode. Click the appropriate button to agree.

8. In the Progress window you can see in real-time a detailed report on all actions carried out by the program.

After completing the operation the program will automatically reboot the computer.

This operation can also be accomplished with our recovery media. To make Windows bootable on different hardware, please additionally complete the <u>P2P</u> Adjust OS Wizard.

Restoring a dual boot Mac from an external USB drive

Let's assume that your Mac fails to boot because of a hard disk malfunction. But you've got a backup of your hard disk on an external USB drive. Just replace the failed disk with a new one and carry out a bare metal restore.

To restore a dual boot Mac from a backup image located on an external USB drive, please do the following:

1. Start up the computer from our Linux/DOS recovery media.

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

- 2. Connect an external USB drive to the computer.
- 3. Restart the computer.
- 4. In the boot menu select **Normal Mode** to use the Linux recovery environment, since it's the only mode that enables to work with USB devices.

By default the Normal Mode will be automatically initiated after a 10 second idle period.

- 5. In the Linux launch menu select the Simple Restore Wizard.
- 6. On the Wizard's Welcome page, click the Next button.
- 7. On the What to Restore page, click the standard browse button [...] to find the required archive. When done, double click on it to select.

File name: leo_vista.pbf Open		Select archive	×

Restoring a file increment

Let's assume that you're busy with developing some project and you make file increments of it on a day-to-day basis not to lose valuable information. So you've got a file backup chain. One day you understand that the job of the last three days is a complete and utter failure. Don't give up – recover your project to the state when everything's ok.

To restore a file increment, please do the following:

1. Click the **Restore** item of the Wizards menu.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

2. On the Restore Wizard's Welcome page, click the Next button.

- 3. On the Browse for Archive page, specify the required file increment:
 - By clicking the **Switch to Archive List View** link, you can see a list of images contained in the Archive Database (if any).

8. The program will require the system restart to accomplish the operation in a special boot-up mode. Click the appropriate button to agree.

9. In the Progress window you can see in real-time a detailed report on all actions carried out by the program.

After completing the operation the program will automatically reboot the computer.

Copying of data from the corrupted system disk to another hard disk

To retrieve valuable information from your hard disk and copy it to another hard disk when the system fails to boot, please do the following:

- 1. Connect the second hard disk to the computer.
- 2. Start up the computer from our Linux/DOS recovery media.

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

3. In the boot menu select **Normal Mode** to use the Linux recovery environment (more preferable) or **Safe Mode** to use the PTS DOS recovery environment (in case you've got problems with Linux). Moreover you've got the option to boot into the **Low-Graphics Safe Mode** (PTS DOS safe mode) to cope with a serious hardware incompatibility. In this case, only the minimal set of drivers will be included, like hard disk, monitor, and keyboard drivers. This mode has simple graphics and a simple menu.

By default the Normal Mode will be automatically initiated after a 10 second idle period.

- 4. In the Linux launch menu select the File Transfer Wizard. You can find the same wizard in PTS DOS as well.
- 5. On the Wizard's Welcome page, click the Next button.
- 6. Select a disk where the files you need are stored from the pull-down list in the right pane of the page.

7. Select files you want to copy and place them to Clipboard by pressing the left arrow-button.

Clipboard	Source

	To copy: 12.0 Mb
	Overall progress

- 11. After the operation is completed, close the wizard by pressing the appropriate button.
- 12. Turn off the computer.

This operation can also be accomplished with our recovery media.

Copying of data from a backup to the corrupted system partition

The system fails to boot since some files are damaged. If you have a backup of the system partition, you can recopy these files to make the system be operable again:

1. Start up the computer from our Linux/DOS recovery media.

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

2. In the boot menu select **Normal Mode** to use the Linux recovery environment (more preferable) or **Safe Mode** to use the PTS DOS recovery environment (in case you've got problems with Linux). Moreover you've got the option to boot into the **Low-Graphics Safe Mode** (PTS DOS safe mode) to cope with a serious hardware

incompatibility. In this case, only the minimal set of drivers will be included, like hard disk, monitor, and keyboard drivers. This mode has simple graphics and a simple menu.

By default the Normal Mode will be automatically initiated after a 10 second idle period.

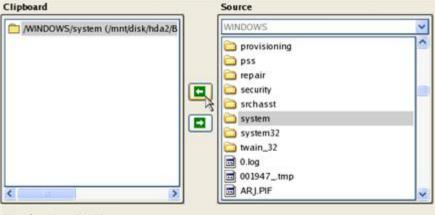

- 3. In the Linux launch menu select the File Transfer Wizard. You can find the same wizard in PTS DOS as well.
- 4. On the Wizard's Welcome page, click the Next button.
- 5. Select a disk where the system backup is stored from the pull-down list in the right pane of the page.

6. Double click on the required backup to open.

7. Select files you want to copy and place them to Clipboard by pressing the left arrow-button.

Total data size: 904 Kb

Copyright© 1994-2011 Paragon Software Group. All rights reserved.

Click the Calc button to estimate the resulted data size.

8. On the Select Destination Type, choose the way the data will be stored. Select the **Save data to any local drive or a network share** item.

Please select how would you like to save the data:

Save data to any local drives or a network share Choose this option if you want to save your data to local mounted or physical partition, to USB or FireWare external drives and to a mounted network share. You will be prompted to choose a location you want to save the archive to.

O Burn data to CD/DVD

Choose this option if you want the Wiz ard to burn the data to CD or DVD. You will be prompted to choose a CD or DVD RW drive.

9. On the Select Destination Path page, select your system disk to copy the data to by pressing the standard browse button [...].

Restoring separate files and folders from a backup

The program provides a very convenient option to access backup archives and restore only data you need (the so called selective restore functionality).

Restore Wizard

To restore separate files and folders from a backup image with the Restore Wizard, please do the following:

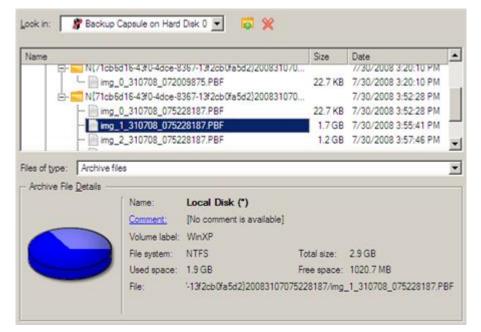

1. Start up the computer from our WinPE recovery media.

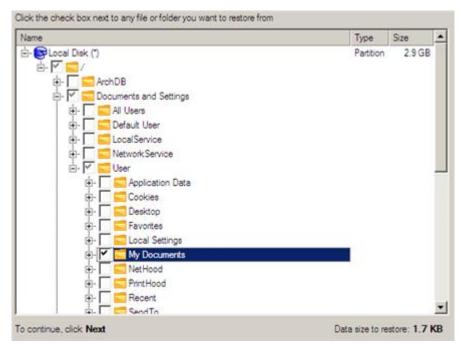

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

- 2. Once you accept the agreement, you will see the Universal Application Launcher. Select the Restore Wizard.
- 3. On the Restore Wizard's Welcome page, click the Next button.
- 4. On the Browse for Archive page choose the required archive in the browser-like window. The Archive File Details section displays a short description of the selected image.

5. On the next page specify what you need to extract from the backup by marking checkboxes next to the required data items. At the right lower corner of the window you can see the resulted amount of the selected data.

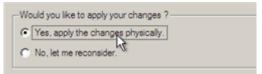

6. On the How to Restore page specify the way the selected data will be restored. In our case we'd rather restore contents of the backup to its original location with replacing existing files as well.

	es to: Original localtion 💌
The files a	nd fold Original location Specific folder or your computer
When rest	toring files that already exist on your computer
C Leave	existing files
Replace	ce existing files

7. On the Restore Summary page review all parameters of the operation and modify them if necessary.

lease overview the restoree options. You can n title hyperlinks.	return to the corresponding page and change the options by cliking
Objects to Restore	
Object(s) selected:	1
Total data size:	1.7 KB (1.743 Bytes)
Original restore destination	
Destination path:	C:/
Space available on destination:	1 GB (1.097.949.696 Bytes)

8. On the next page of the wizard confirm the operation by selecting the appropriate option.

- 9. In the Progress window you can see in real-time a detailed report on all actions carried out by the program.
- 10. After completing the operation close the wizard, and then reboot the computer.

File Transfer Wizard

To restore separate files and folders from a backup image with the File Transfer Wizard, please do the following:

 Call the popup menu for the required backup image (right click of the mouse button) in the Archive Database and then select the menu item: Restore File from Archive. Thus you automatically open it with the File Transfer Wizard.

Show	al 💽 😂 🚯	B B

Resize Scenarios

Creating a new partition to detach operating system from the rest of data

Let's assume that you're a rank and file user who is most likely to have only one hard disk with only one partition (the only partition is always system). To secure yourself against a system malfunction or a virus attack you've got nothing to do, but make a backup of the whole partition, which besides the operating system itself contains all your family photos, favorite films and music, program distributives, whatever. As a result you'll get a very huge backup image. You can easily tackle this issue however by detaching your operating system from the rest of data.

To create a new partition on your hard disk, please do the following:

1. Click the Express Create Partition item of the Wizards menu.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

- 2. On the Wizard's Welcome page, click the Next button.
- 3. Choose a method you find the most suitable to create the partition. The wizard is especially designed to minimize your participation in finding an appropriate place for it and its resulted size. The only thing you're to do is to choose between several modes. The most relevant thing here is the amount of space that will be allocated for that partition. For easy perception, you can see the resulted disk layout on the disk map by selecting this or that mode.

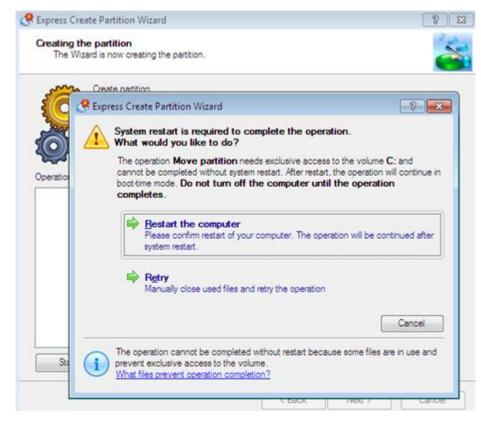

The number of available methods depends on your disk layout.

To learn more on the way the wizard works, please click the corresponding link on the first page of the wizard.

4. That's basically it. By clicking the Next button the wizard will start modifying your disk layout. If you've got to do with the system partition resize, like we do in our case, you will be asked to restart your computer in a special boot-up mode to accomplish the operation. So click the appropriate button to agree.

5. In the Progress window you can see in real-time a detailed report on all actions carried out at the moment.

After completing the operation your computer will be automatically restarted back to Windows where you can see the newly created NTFS partition. Now you've got a place to keep your stuff apart from Windows.

Increasing size of a system partition by taking unused space of an adjacent partition

Let's assume you've got several partitions on your hard disk. After installing a number of resource-consuming applications and system updates your system partition has started to suffer from the lack of free space. But an adjacent partition has a plenty of redundant space. That's just enough to make your system partition suffer no more.

To increase size of a system partition by taking unused space from an adjacent partition, please do the following:

1. Click the Express Resize Partitions item of the Wizards menu.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

- 2. On the Wizard's Welcome page, click the Next button.
- 3. Click on your system partition. By doing that, the wizard will automatically select an adjacent partition as well. This partition will later act as a space donor.

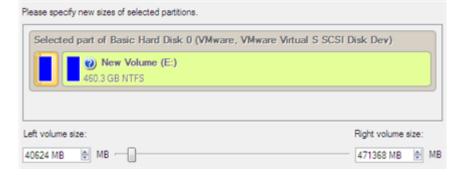

The wizard will resize space between Local Disk (C:) and New Volume (E:) on Basic Hard Disk 0 (VMware, VMware Virtual S SCSI Disk Dev). Select left partition from a pair of adjacent partitions you would like to resize. Right adjacent partition will be selected automatically.

If you've got more than two partitions on your hard disk and a partition you need to increase is surrounded by other partitions, you've got the choice to choose which partition will act as a space donor. Just click on the left partition of the pair, as the right one will be selected automatically.

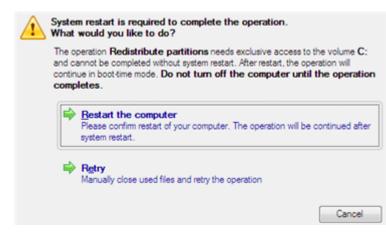

4. Increase size of the system partition with the slider or manually by entering the required value. Please note, when you change size of one partition the size of the other will be changed as well, thus redistributing the unused space between the partitions.

5. On the next page of the wizard you need to confirm the operation by selecting the appropriate option.

6. That's basically it. By clicking the Next button the wizard will start modifying your disk layout. If you've got to do with the system partition resize, like we do in our case, you will be asked to restart your computer in a special boot-up mode to accomplish the operation. So click the appropriate button to agree.

7. In the Progress window you can see in real-time a detailed report on all actions carried out at the moment.

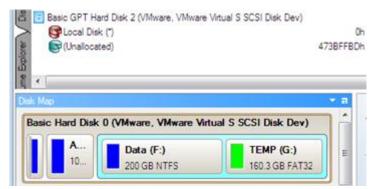

After completing the operation your computer will be automatically restarted back to Windows where you can see that your system partition is bigger now.

Increasing size of a system partition by taking unused space from any other

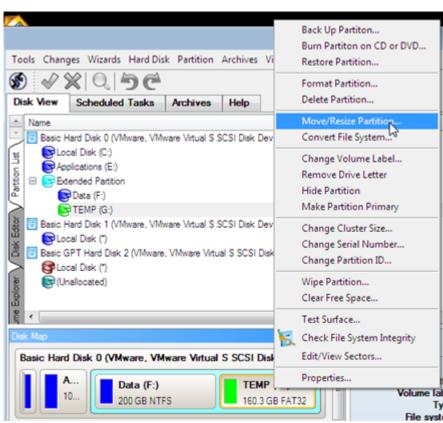

Let's assume you've got several partitions on your hard disk. After installing a number of resource-consuming applications and system updates your system partition has started to suffer from the lack of free space. But one of your partitions has a plenty of redundant space. That's just enough to make your system partition suffer no more.

To increase size of a system partition by taking unused space from any other on-disk partition, please do the following:

- 1. Click Switch to Full Scale Launcher in the Express Launcher.
- 2. In the main window select the required hard disk (if several) on the Disk Map.

3. Choose a space donor partition and then call the context menu for it (right click of the mouse button) to launch the Move/Resize dialog.

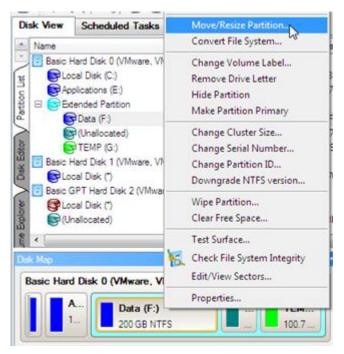

4. In the opened dialog shift the edge of the partition to the right by the drag-and-drop technique. While doing this, free space from the partition will be released (displayed in aqua-green). You can also do it manually by entering the exact size of free space. Click the Yes button to continue.

isic Hard Disk 0	(VMware, VMv	vare Vir	tual S SCSI Disk Dev)
(Unalloca	ted)	🕜 TE	MP (G:)
59.5 GB	100.7 GB FAT32		
/olume size:	103.167.39 MB	•	86 MB - 164,156 MB
ree space before:	60.988.95 MB	0.	0 bytes - 164,070.09 MB
ree space after:	0 Bytes		0 bytes - 164,070.09 MB

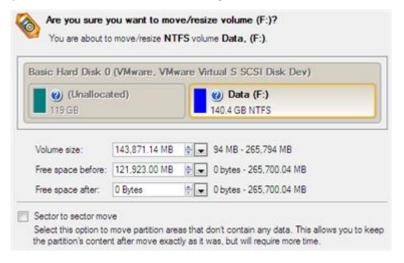

5. Now you've got a block of free space to add to the system partition. You cannot do it directly however, but by carrying out a number of extra move/resize operations.

6. Since the block of free space is within the extended partition, you need to take it out first. The program enables to resize the extended partition only when there's a block of free space adjoining its borders. In our case it's between two logical disks. So we need to move it. To do that, please select the first logical partition and then call the context menu for it (right click of the mouse button) to launch the Move/Resize dialog.

7. At first shift the right edge of the partition to the right, then do the same with the left edge. Make sure the partition size has been left unchanged.

8. Now you can resize the extended partition to take the block of free space out of it. Call the context menu for it (right click of the mouse button) to launch the Move/Resize dialog.

Call a context menu for the extended partition (with the blue border), not the logical one.

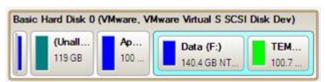

9. In the opened dialog shift the edge of the extended partition to the right.

Basic Hard Disk 0	Disk Dev)			
(Unalloca 119 GB	9	Data (F:) ② TEMP (G: 100.7 GB FAT3) 0.4 GB NTFS 100.7 GB FAT3)		
Volume size:	247,038.60 MB	€ 247,038 MB	- 368,969 MB	
Free space before:	121,930.84 MB	🗼 💌 0 bytes - 121	,930.84 MB	
	0 Bytes	↓ 0 MB		

10. The block of free space has been released.

11. Now you need to move the second primary partition just the way we did it with the logical partition to make the block of free space adjoin the system partition.

- 12. Finally increase size of the system partition. Call the context menu for it (right click of the mouse button) to launch the Move/Resize dialog.
- 13. In the opened dialog shift the edge of the partition to the right, thus increasing its size.

sic Hard Disk 0	(VMware,)	VMware V	firtual S SCSI Disk Dev)

New Volume (E:) 83.9 GB NTFS			Check File System Integrity Edit/View Sectors
C			

4. Confirm the operation by clicking the Yes button. By default, our program works in the virtual mode of execution, so you can either confirm all operations to let the program accomplish them or continue work in the virtual mode.

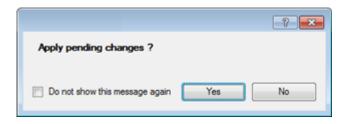

- 5. Click the Merge Partitions item of the Wizards menu (any of the ways described earlier can also be used here).
- 6. On the Wizard's Welcome page, click the Next button.
- 7. Select a volume you want to expand, i.e. the system one.

possible to select on	in choose a partition that will be expanded to include adjacent partition. Please note that it is by FAT, FAT32 or NTFS partitions. You will not be able to proceed further if no adjacent ses are present on the disk.
Basic Hard Dis	k 0 (VMware, VMware Virtual S SCSI Disk Dev)
() L 15.9 G	Wow Volume (E:) 83.9 GB NTFS

8. Select a volume you'd like the first volume to merge with. Please note that all contents of the selected partition will be placed into a specific folder after the merge operation is over.

ent partition to merge with the target partition. This partition will be merged to the one you have previous page. The content of the second partition will be placed in a folder inside the resulting
 Disk 0 (VMware, VMware Virtual S SCSI Disk Dev)
 er name to keep content of the selected partition merged_partition_content

- 9. Review the changes and complete the wizard.
- 10. Apply all introduced changes. By default, our program works in the virtual mode of execution, so you have to confirm all operations to let the program accomplish them. To do that, just click the Apply button on the Virtual Operations Bar.

- 11. If you've got to do with the system partition resize, like we do in our case, you will be asked to restart your computer in a special boot-up mode to accomplish the operation. So click the appropriate button to agree.
- 12. In the Progress window you can see in real-time a detailed report on all actions carried out at the moment.

After completing the operation your computer will be automatically restarted back to Windows where you can see that you have the merged volume now.

Shrinking a system partition to increase size of a data partition

Let's assume you've got two partitions on your hard disk, the first one takes about 40% of all the disk space and is exclusively used for Vista 64-bit, while the second servers as a data storage. One day you realize that your system partition doesn't need so much disk space, that's what your data partition really requires at the moment. You can easily tackle this problem with Paragon Linux/DOS recovery environment.

To increase size of a data partition by taking unused space from a system partition, please do the following:

1. Start up the computer from our Linux/DOS recovery media.

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

2. In the boot menu select Normal Mode to use the Linux recovery environment (more preferable) or Safe Mode to use the PTS DOS recovery environment (in case you've got problems with Linux). Moreover you've got the option to boot into the Low-Graphics Safe Mode (PTS DOS safe mode) to cope with a serious hardware incompatibility. In this case, only the minimal set of drivers will be included, like hard disk, monitor, and keyboard drivers. This mode has simple graphics and a simple menu.

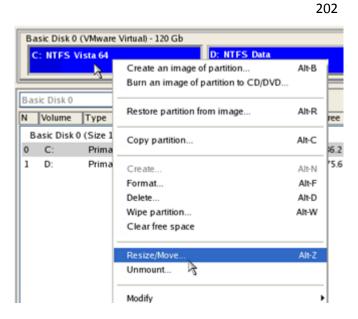

By default the Normal Mode will be automatically initiated after a 10 second idle period.

- 3. In the Linux launch menu select Hard Disk Manager. You can find it in PTS DOS as well.
- 4. In the main window select the required hard disk (if several) on the Disk Map.

Hard Disk	Part	ition Op	erations	Wizards	Help			
ik nage of ha ge of hard		isic Disk 0	(VMware V ista 64	irtual) - 120		D: NTFS Dat	a	
Disk fron isk	Bas	ic Disk 0		Mode	VMware 1	Virtual, Size 1	20 Gb

Resizing partitions of Apple Boot Camp

Let's assume you're a Boot Camp user who's got Windows XP as the second operating system. Initially allocated space for the Windows partition has turned out to be insufficient for your current needs. The only way out is to take some space from your Mac partition, thus redistributing the unused space between the partitions.

To increase size of the Windows partition by taking unused space from the Mac partition, please do the following:

1. Click the Express Resize Partitions item of the Wizards menu.

	There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.
\sim	chapter to know more on the subject.

- 2. On the Wizard's Welcome page, click the Next button.
- 3. The wizard will automatically select Windows (the NTFS file system) and Mac (the Apple HFS file system) partitions of your Boot Camp configuration.

The wizard will resize space between Local Disk (*) and WinXP (C:) on Retained Basic GPT Hard Disk 0 (VMware Virtual IDE Hard Drive).

Select left partition from a pair of adjacent partitions you would like to resize. Right adjacent partition will be selected automatically.

Local Disk (*)	WinXP (C:)
Local Disk ()	winse (c.)
54.8 GB Apple HFS	56.5 GB NTES

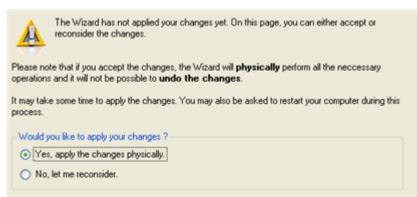

On the disk map you can also see the GPT service partition (called EFI) as well as a 128megabyte free block between Mac and Windows partitions made with Boot Camp. It's just for your information.

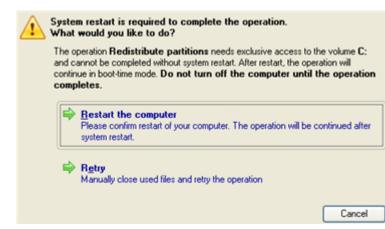

4. Increase size of your Windows partition with the slider or manually by entering the required value. Please note, when you change size of one partition the size of the other will be changed as well, thus redistributing the unused space between the partitions.

U Local Disk (*) 40.2 GB Apple HFS	
_eft volume size:	Right volume size:

5. On the next page of the wizard you need to confirm the operation by selecting the appropriate option.

6. That's basically it. By clicking the Next button the wizard will start modifying your disk layout. If you've got to do with the system partition resize, like we do in our case, you will be asked to restart your computer in a special boot-up mode to accomplish the operation. So click the appropriate button to agree.

7. In the Progress window you can see in real-time a detailed report on all actions carried out at the moment.

After completing the operation your computer will be automatically restarted back to Windows where you can see that your system partition is bigger now.

Creating Dual Boot Systems

For Windows computers

Release of Windows Vista has given a new impetus to the problem of establishing a dual boot system. In this connection we decided to consider two the most frequently used situations a rank and file user may face, i.e. Windows Vista + Windows XP and Windows XP + Windows Vista. Please note that for reasons of better security and system independence these operating systems will be installed on different partitions. That is why we need to hide the first system partition before installation of the second OS.

Windows Vista + Windows XP

Suppose you have got Windows Vista coming with your brand new computer. Everything is great except one thing – your favourite applications simply reject to work correctly on it. Software updates are expected to release in the near future, but you cannot wait any more. Thus the best way out is to leave Windows Vista intact and install the time-proved Windows XP.

Most likely you have only one hard disk with only one partition (the only partition is always system). To install the second operating system you need to repartition your drive first, as it requires a separate primary partition.

Install New OS Wizard

This scenario implies that operating systems will be installed on different partitions to provide better security and system independence.

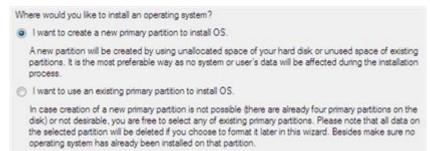

1. Click the Install New OS item of the Wizards menu.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

2. On the Wizard's Welcome page, click the Next button.

3. Select the appropriate option to create a new primary partition on your hard disk.

4. On the next page of the wizard, define size of the new partition. If the selected hard disk contains blocks of free space, the wizard will automatically merge them all and allocate the resulted space to create the partition. If not, it will take 50% of the unused space of an adjacent partition, thus resizing it.

🥑 Vista (C:)	(Unallocated)
A REAL PROPERTY AND A DESCRIPTION	
158.7 GB NTFS	341.2 GB

5. The next page enables to specify a file system and a number of additional parameters. Since we are going to install Windows XP, the most preferable file systems are NTFS and FAT32. Click the Yes button to continue.

On this page you can specify a number of additional parameters that can also be of help. However here we pay attention to the most relevant to fulfill our task.

6. Enter a label for the future partition in the textual field. It will later be used for the drive identification.

7. The program will carry out all the necessary operations and then automatically restart the computer to initiate the installation process.

If you've changed your mind on installing a new operating system, don't insert its distributive CD but press ESC when the following message appears:

OS label: Windows XP

```
Insert distributive CD/DVD and press any key to continue
or <Esc> to abort the action
Please make sure your BIOS is set up to boot from CD/DVD.
```

All the mentioned above operations can also be accomplished with the WinPE recovery environment.

8. Install Windows XP on the newly created partition. We won't go into details as for its installation, as you can find all the necessary information in documentation that comes with the product. However to avoid any problems, we consider it necessary to draw your attention on the following issues:

- You need a bootable distributive CD of Windows XP to install it;

- To automatically start your computer from this CD, make sure the on-board BIOS is set up to boot from CD first or press F12 during startup to select a bootable device;

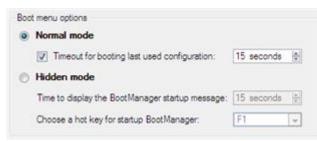

- Do not forget to select the newly created partition as destination.

9. So if everything is OK, you've got to have by this moment Windows XP successfully installed. Your Windows Vista however is still non-bootable. To fix this issue you need to launch the Boot Manager Setup wizard. To do that, please install our program once again, but this time in Windows XP to activate Boot Manager.

- 10. Click Boot Management and then select Boot Manager in the Express Launcher.
- 11. Set up the Boot Manager wizard. The parameters offered by default will do in our case, so just complete the wizard and it will automatically find the two operating systems and update the MBR.

12. Now restart the computer to make sure you have got a dual boot system.

Copyright© 1994-2011 Paragon Software Group. All rights reserved.

Traditional way

This scenario implies that operating systems will be installed on different partitions to provide better security and system independence.

- 1. Click Switch to Full Scale Launcher in the Express Launcher.
- 2. In the main window select your hard disk on the Disk Map to make a block of free space on it.

dtor / Pa		Volume letter: Volume label:	[No label]	Serial number: Partition ID:
Disk Editor	1	File system:		NTFS version: Volume Size:
		Root entries: Sectors per boot:		Partition size: Used space:
(olume Explorer	-	Sectors per cluster:		Free space: Activity: Hidden state:
Properties 🗸 W	Move/Resize Pa Resize or Move part			
-	Format Partition	u to format the selected partition	10	
Dick Map		R R R R R R R	20. (29) - F	
-	rd Disk 1 (VMware,	VMware Virtual S SCSI D	isk Dev)) •
-	al Disk (E:)			
100	a Disk (C.)			

3. Release some free space (not less than 10 GB to install Windows XP) from the partition. To do that, please call the context menu for the selected partition (right click of the mouse button) and launch the Move/Resize dialog.

Di	k View	Scheduled Tasks	Archives	Help		
*	Loc	📎 Hard Disk Manager'	м		? 💌	
Edtor Pa	2				size volume (E:)? lume [No label], (E:).	A16-76D

(Loc 499				Yes No	Volume Volume

- 209
- 4. In the opened dialog shift the edge of the partition to the left by the drag-and-drop technique. While doing this, free space from the partition will be released (displayed in aqua-green). You can also do it manually by entering the exact size of free space. Click the Yes button to continue.

sic Hard Disk 1	(VMware, VMw	are Vir	tual S SCSI Disk Dev)
🕜 Local Dis	k (E:)		(Unallocated)
268.3 GB NTFS			231.6 GB
olume size:	274.790.513MB	10 .	101 MB - 511,993 MB
ee space before:	and the second s		0 bytes - 511,891.43 MB
ee space after:	237,201.92 MB		0 bytes - 511.883.61 MB

The Move/Resize dialog offers a number of additional parameters that can also be of help. However here we pay attention to the most relevant to fulfill our task.

5. Now you have a block of free space sufficient in size to hold a new partition.

6. Create a new partition to install Windows XP. To do that, please call the context menu for a newly created block of free space (right click of the mouse button) and launch the Create Partition dialog.

un:	Are you sure you want to creat You are about to create a new partit position and file system of the new p	tion in (U	Summer		e select size.	
	Basic Hard Disk 0 (VMware, VMwa	re Virtu	al S SCSI I	Disk Dev)		
8	Create new partition as: Please specify new partition size: Please specify size of free space before the p Please specify size of free space after the pa		Primary por 349451 (±) 0 (±)	ttion 7 MB - 349,451 MB 0 MB - 349,437 MB 0 MB - 349,443 MB		drive
		NTFS Vew Volu	me	•		
Мар	Please specify drive letter:	F:				spa
asic H	(S) More options			Yes	No	1.2 GI

7. Define parameters of the future partition. By all means it has to be primary and since we are going to install Windows XP, the most preferable file systems are NTFS and FAT32. Click the Yes button to continue.

Create new partition as:		Primary par	tilion 💽
Please specify new partition size:		349451 🔄	7 MB - 349,451 MB
Please specify size of free space before the partition:		0	0 MB - 349,437 MB
Please specify size of free space after the partition:		0	0 MB - 349,443 MB
lease select file system for new partition: NTFS			
Please enter new volume label:	New Volu	me	
Please specify drive letter:	F:	•	
(¥) More options			Yes No

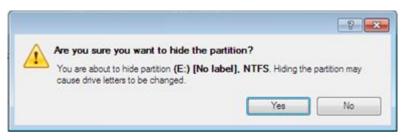

The Create Partition dialog offers a number of additional parameters that can also be of help. However here we pay attention to the most relevant to fulfill our task.

8. As a result of the operation we have got a newly created FAT32 partition just enough in size to comfortably work with Windows XP.

9. Hide the Windows Vista partition to avoid writing any data on it during the Windows XP installation, as it is the best way to provide system independence. To do that, please call the context menu for it (right click of the mouse button) and launch the Hide Partition dialog. Click the Yes button to continue.

Hiding of the system partition will make OS non-bootable, what is quite normal.

10. Apply all introduced changes. By default, our program works in the virtual mode of execution, so you have to confirm all operations to let the program accomplish them. To do that, just click the Apply button on the Virtual Operations Bar.

	? 💌
Apply pending changes ?	
Do not show this message again	Yes No

11. The program will require the system restart to accomplish the operation in a special boot-up mode. Click the appropriate button to agree.

After all the operations are completed you will not be able to restart the system, what is quite normal. Nevertheless if you do try it, the following error will occur:

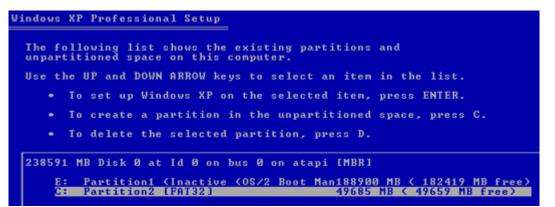

TOP: c000021a {Fatal System Error} he initial session process or system process terminated unexpectedly with a sta us of 0x00000000 (0xc0000034 0x0010037c). he system has been shut down.

All the mentioned above operations can also be accomplished with the WinPE recovery environment.

- 12. Install Windows XP on the newly created partition. We won't go into details as for its installation, as you can find all the necessary information in documentation that comes with the product. However to avoid any problems, we consider it necessary to draw your attention on the following issues:
 - You need a bootable distributive CD of Windows XP to install it;

- To automatically start your computer from this CD, make sure the on-board BIOS is set up to boot from CD first or press F12 during startup to select a bootable device;

- Do not forget to select the newly created partition as destination.

Installation of Windows XP will make Windows Vista non-bootable.

13. Launch the Boot Manager Setup wizard. As your Windows Vista is non-bootable any more, you need to install our program once again, but this time in Windows XP to activate Boot Manager.

To avoid double installation, please use our recovery media to activate Boot Manager.

- 14. Click Boot Management and then select Boot Manager in the Express Launcher.
- 15. Set up the Boot Manager wizard. The parameters offered by default will do in our case, so just complete the wizard and it will automatically find the two operating systems and update the MBR.

16. Now restart the computer to make sure you have got a dual boot system.

Windows XP + Windows Vista

If you've got Windows XP and are willing to try the latest Windows Vista but not sure your favorite applications will flawlessly work on it, the best way out is to leave the time-proved Windows XP intact and install Windows Vista for studying purposes.

As this very situation is very close to the previous one, please use the <u>Windows Vista + Windows XP</u> scenario. However please take into consideration one more step you need to accomplish if you decide to use the traditional scenario:

 Besides hiding of the system partition before installation of the second OS you need to make it inactive as well. To do that, please call the context menu for it (right click of the mouse button) and launch the corresponding dialog. Click the Yes button to continue;

1		2		File system	S
	Are you sure you want to set the volume as i	nactive?	rive	Not formatted	6 2
	You are about to set the volume (*) WinXP, NTFS no longer boot correctly.		NTFS	1	
		Yes No			
Ì	(*) 184.8 GB NTFS				
	NTFS FAT32	FAT16 Linux Ext2		Linux Ext3	

Reviving the system partition

In case you are not able or not willing to complete the mentioned above scenarios, but have already reached the point when all changes are applied and everything is ready to install the second OS, please do the following to make your system bootable once again (only relevant for the traditional scenario):

1. Start up the computer from our Linux/DOS recovery media.

up to boot from CD/USB first.

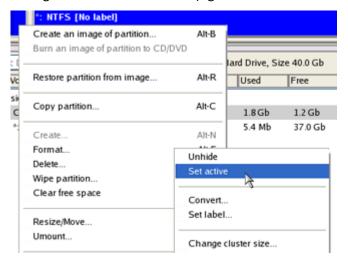

- 2. In the Linux launch menu select Hard Disk Manager.
- 3. In the main window select your non-bootable Windows partition on the Disk Map.

a	Basic Disk 0 Model VMware Virtual IDE Hard Drive, Size 250 Gb						D	
							Volume label	
111	Ν	Volume	Type	File System	Size	Used	Free	volume label
	В	asic Disk	0 (Size 250 Gb	1)

	1	D:	Primary	FAT32	49.7 Gb	24.9 Mb	49.6 Gb	[No label]

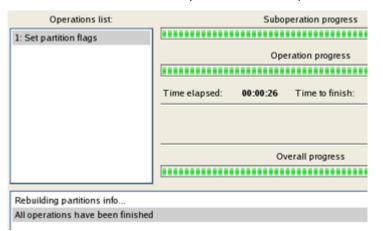

4. Unhide the partition by calling the context menu for it (right click of the mouse button) and then selecting **Unhide**.

	Create an image of partition Burn an image of partition to CD/D	Alt-B		
y pe	Restore partition from image	Alt-R	ze 250 Gb Free	Volume labe
ize rin	Copy partition	Alt-C	199 Gb	Vista
rin	Create Format Delete Wipe partition Clear free space	Alt-N Unhide Set activ Convert	-	[No label]
	Resize/Move Umount	Set labe	l cluster size	
	Modify	-	root size boot size	
	Retest surface			

5. Only for the Windows XP + Windows Vista scenario you need to make the system partition active as well by calling the context menu for it (right click of the mouse button) and then selecting **Set Active**.

6. You will be notified after the operations are completed.

7. Restart the computer.

System Migration Scenarios

Migrating Windows OS to a solid state drive (Migrate OS to SSD)

The latest SSDs do not boast high capacity, but rather smaller size and faster processing speeds over regular hard drives. Plus, they are completely indifferent to mechanical impact, a feature crucial for mobile computers. These benefits are leading more and more users to consider migrating at least OS to SSDs to get the most out of their systems.

So, how do you migrate a Windows OS and hundreds of gigabytes of data on one huge volume to an SSD drive of 80-128GB? Our Migrate OS to SSD Wizard can help you do that with minimal effort.

To migrate any Windows OS since XP from a regular hard disk to a fast SSD, please do the following:

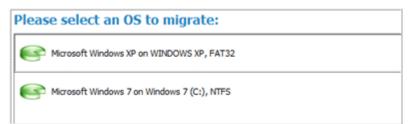

- 1. Connect an SSD drive to the computer.
- 2. Turn on the computer.
- 3. Click the <Migration> button and then select Migrate OS to SSD.
- 4. The first page of the wizard informs the user on the upcoming operation. Please read all notes carefully before you proceed. To get additional information on the subject, click the **Learn more about migrating OS** link at the bottom of the window (highly recommended). Once you're done with that, click **Next** to continue.

🍪 Migrate OS to SSD	? 💌					
Welcome to the Migrate OS to SSD!						
This utility will help you copy the operating system, programs and data to another HDD or SSD.						
A Before you begin, please note the following:						
Migration process will delete all the data on the target disk, so please make sure you've saved all the information you need before migrating.						
Due to technical reasons this tool cannot migrate OSes installed on dynamic volumes. We are this.	e sorry for					
Learn more about migrating OS Next >	Cancel					

All data stored on the destination disk will be lost during the operation. Please save it to another location beforehand.

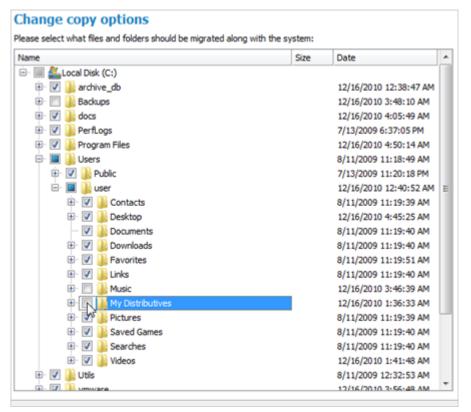

5. The wizard will scan your computer for system partitions that accommodate any of the supported Windows OSes. If several are found, it will let you specify which operating system you'd like to migrate.

6. Depending on your choice, it will then automatically pick one or two on-disk partitions (Windows 7 may have Microsoft System Reserved, a special hidden partition that contains boot critical files) and prompt you to select a destination disk (if there are more than two drives besides the source). If the selected disk is enough in capacity to hold your OS, it will prompt you to start the migration. If not (just our case), click on the link below the warning note to additionally exclude some data from the partition.

7. Unmark checkboxes opposite unnecessary files or folders to try to fit into the destination disk. We do not recommend you to exclude system files, but those that could take plenty of disk space, like video, music, photos, etc. Once you're ready with the exclusion, click **OK** to let the wizard calculate the resulted size of the partition.

8. If a success, you'll see a note that everything's ready to start the migration. Since we're going to use our SSD drive exclusively for Windows OS, we additionally mark the appropriate checkbox to let the wizard expand the resulted partition across all on-disk space. Click **Copy** to initiate the migration process.

That's actually it. After the migration is over, you will need to configure the destination disk as the first boot device in BIOS to automatically start up the system from it. If a success, <u>delete the Windows OS partition</u> from the source disk, then <u>re-partition the disk according to your needs</u>.

Migrating system to a new HDD (up to 2.2TB in size)

Let's assume that you've bought a new hard disk that is up to 2.2TB in capacity. It's faster and of much higher capacity than your current system disk, so it's quite natural you start thinking about system migration. We can help you do that.

If the target hard disk exceeds the 2.2TB capacity limit, please consult the Migrating system to a 2.2TB+ HDD scenario.

To migrate your system to a hard disk that doesn't exceed the 2.2TB capacity limit, please do the following:

- 1. Connect both source and destination disks to the computer.
- 2. Turn on the computer.
- 3. Click the **Copy Disk** item of the Wizards menu.

There are other ways to start up this function, please consult the <u>Interface Overview</u> chapter to know more on the subject.

- 4. On the Wizard's Welcome page, click the Next button.
- 5. On the Select Hard Disk to Copy page, select a source disk (a hard disk you want to copy).

On this page, you can choose a hard disk you would like to copy. All partitions from this hard disk will be copied to the destination you will choose on the next page.

6. On the Select Target Hard Disk page, select a destination disk (a hard disk to copy contents of the source disk).

Select a target hard disk. All data from the source hard disk will be copied there. During copy operation, target disk content will be **deleted**.

Basic Hard Disk 0 (VMware, VMware Virtual S SC	SI Disk Dev)
Local Disk (C:) 499.9 GB NTFS	
Basic Hard Disk 2 (VMware, VMware Virtual S SC	SI Disk Dev)
Archives (G:) 41.9 GB NTFS	Backup Capsule 38 GB
Basic Hard Disk 3 (VMware, VMware Virtual S SC	SI Disk Dev)
(Unalloc Basic Hard Disk 3 (VMware, VMware, VMwar	e Virtual S SCSI Disk Dev)

During the operation all contents of the destination disk will be deleted.

7. On the next page of the wizard, define the copy options. In our case we'd rather copy data with a proportional resize to occupy the entire disk.

8. On the Revise Copy Results page review all parameters of the operation.

219

- 10. When copying is completed, shut down the computer.
- 11. Disconnect (physically) the source hard disk.
- 12. Boot the computer from the destination hard disk.

To make Windows bootable on different hardware, please additionally complete the <u>P2P</u> Adjust OS Wizard.

Using 2.2TB+ HDD as internal data storage in Windows XP

As you know 2.2TB+ drives are out of the supported size range for the popular Windows XP system. Though two new Windows versions have been released since XP, it's still utilized on 51% of computers worldwide. Meaning, roughly half of PC users simply cannot use the new hard disk drives.

We can help you augment Windows XP by adding support for GPT (GUID Partition Table) disks, thus you will be able to use all disk space on ultra high capacity drives:

GPT Loader enables to use all disk space of modern 2.2TB+ drives under Windows XP, but only for storing data, not for the Windows XP accommodation.

Only internally connected single 2.2TB+ drives are supported, not external storages, or those combined into RAID (Redundant Array of Independent Disks).

 As an example we've taken a new 3TB hard disk (Disk 1 in the system). As you see Windows XP detects it as a 750GB disk. It's due to the fact that this operating system works only with MBR (Master Boot Record) disks, so it cannot address disk space beyond 2.2TB limit. If a drive exceeds this limit, OS detects the remaining slice of space (750GB in our case) only, thus making the bulk of the disk space unavailable to the user.

2. First we need to add support for GPT disks to the operating system. To do that, install Paragon GPT Loader. It's included to the product's installation package, but it's not allowed to install by default, so please take it into account.

Click on an icon in the list below to change how a feature is in	stalled.
GPT Loader	Feature Description Install GPT Loader
	This feature requires 152KB on your hard drive.

Windows OSes since Vista do not need functionality of Paragon GPT Loader, so it's only available to install under Windows XP 32/64-bit.

- 3. Restart the system when the installation is over.
- 4. If you launch Windows Disk Management (WDM) now, it will show the same 750GB, since the hard disk is still treated as MBR in the operating system. If you launch our program, you will see that the entire disk space is now correctly detected. Being MBR though, there are two unallocated slices: the maximum available for MBR 2.2TB and 750GB.

Partition List	ion List /				е	Basic MBR Hard D
Name		File system	Volume Size	Partition Size	^	
Second HDD (F:)		NTFS	298 GB	298 G		(Hitachi HDS72303

Commission of the second second	A Granden Statistics				V	<

5. To get access to the entire disk space, we need to convert the disk to GPT. To do that, select in the Main Menu: Hard Disk > Convert to GPT hard disk.

2 🛛
Mre you sure you'd like to convert Basic MBR Hard Disk 1 (Hitachi HDS723030ALA640) to GPT?
Please Note! Despite the fact that all on-disk contents remain intact during the operation, your OS may no longer boot correctly, for Windows XP 32-bit for instance does not support GPT disks.
Yes No

6. Confirm the operation and then apply the pending changes.

7. Now you've got access to the entire disk space and are able to perform functions such as creating a volume using our program or Windows Disk Management.

Volume Explore Disk Edit	Are you sure you want to create a new partition on disk 1? You are about to create a new partition in (Unallocated), 2794.5 GB area. Please select size, position and file system of the new partition.
September 2014 Septem	New Volume (J:) 2794.5 GB NTFS
Partition List Name Basic MBR Hard Disk 0 (S Second HDD (F:)	Please specify new partition size: 2861588 - 7 MB - 2 861 588 MB Please specify size of free space before the partition: 0 0 MB - 2 861 579 MB Please specify size of free space after the partition: 0 0 MB - 2 861 580 MB
Basic GPT Hard Disk 1 (H (Unallocated) Basic MBR Hard Disk 2 (S	Please select file system for new partition: NTFS Please enter new volume label: New Volume Please second data latter
Disk Map Basic GPT Hard Disk 1	Please specify drive letter: J: S More options Yes
(Unallocated) 2794.5 GB	
Basic MBR Hard Disk 2 System (C:) 29.5 GB NTFS	(ST 3160815AS) Applications (D:) 53.4 GB NTFS G6 GB NTFS

When trying to create a volume in WDM just after the conversion to GPT, you will be asked to restart the computer first. The system restart is not required for our program.

When partitioning in WDM, it additionally creates an MSR (Microsoft Reserved) partition, which size may vary from 32MB (for disks up to 16GB in size) to 128MB (for all the others). It's a service partition, which reserves space for particular needs of Microsoft. You won't see it in WDM, but it's available in our program. You're free to delete it.

Making system bootable on different hardware (P2P Adjust OS)

Let's assume you had to migrate to a new hardware platform. You connected your system hard disk to the brand new PC and tried to start up the operating system - you do know for sure now that this operation had been doomed to failure from the very beginning. With our program you can easily tackle this naughty problem.

Before you start, please make sure the following conditions are met:

- You've got drivers for the new hardware ready to use, not zipped or in .exe files.
- Your OS is unrolled on the new computer, not in a backup image.

To make a Windows physical system bootable on different hardware, please do the following:

1. Start up the computer from our WinPE recovery media.

<u>Recovery Media Builder</u> can help you prepare our recovery environment either on a CD/DVD disc or a thumb drive.

To automatically boot from the recovery media please make sure the on-board BIOS is set up to boot from CD/USB first.

2. Launch the P2P Adjust OS Wizard.

Our WinPE 3.0 based environment offers excellent hardware support. However in case it doesn't have a driver for your disk controller, your hard disks will be unavailable. Please consult the <u>Adding specific drivers</u> scenario to know how to tackle this issue.

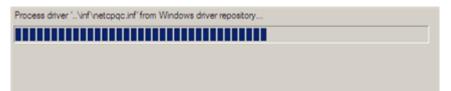

- 3. On the Wizard's Welcome page, click the Next button.
- 4. From the list of all found Windows systems (if several) select one you need to adjust to the new hardware. If you're willing to adjust them all, just re-launch this wizard for each.

5. There are two execution modes to choose from: **fully automatic** and **advance**. Below we will go set-by-step through the automatic scenario to show the whole process, and then take a closer look at <u>specifics of the</u> <u>advance scenario</u>.

- 6. Select Adjust the OS to the new hardware automatically.
- 7. The wizard will automatically accomplish all the necessary actions.

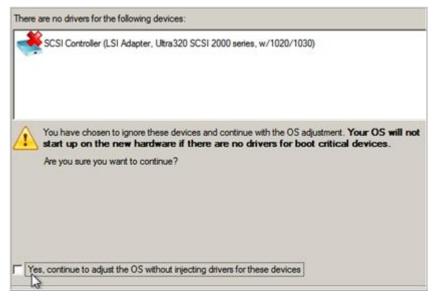

8. The only action that might be required from your side is to set a path to an additional driver repository in case the wizard has failed to find drivers for some boot critical devices in the built-in Windows repository. Generally together with new hardware you get its drivers for different operating systems on removable media (mostly CD or DVD). By collecting all these drivers in one folder you can let the wizard automatically pick and install only those required for your OS. Select Search for drivers in a specific folder.

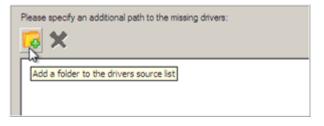

Click on the link at the bottom of the page to see what boot critical devices have no drivers. The wizard names all devices according to their model description, not some alphanumeric code, which is very convenient.

Though you've got the option to continue without injecting missing drivers for boot critical devices (The Ignore all missing drivers option), we strongly recommend you not to do it. Otherwise we cannot guarantee your Windows will start up on the new hardware.

10. The wizard can search for drivers on a local disk or a mapped network share. In our case it's on a network share, this is why we need to map it first.

Please specify an additional path to the missing drivers:	

G	×
Z:\	L2

The wizard enables to specify several driver repositories.

12. If the wizard has found all missing drivers, it will ask you to confirm the operation. Apply the changes to complete.

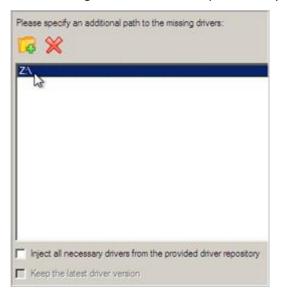

After the operation is completed the system will be bootable on the new hardware. After the startup, Windows will initiate reconfiguration of all Plug'n'Play devices. It's a standard procedure, so please don't worry and prepare the latest drivers at this step to get the most out of the system.

Advance scenario specifics

1. To launch the advance mode, select **Set parameters for the OS adjustment**.

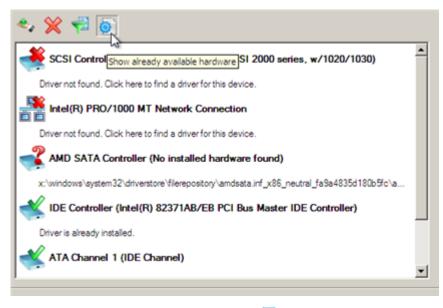

2. When setting additional driver repositories, you can specify how to process drivers for found hardware.

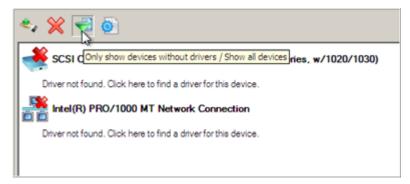

• Inject all necessary drivers... Mark the checkbox to force injection of all drivers for your devices from the given driver repository(s), even if there are already installed drivers for some hardware. Please use this option if you suspect any of the installed drivers of not matching your hardware.

- Keep the latest driver version. Mark the checkbox to keep the latest version of drivers during the forced reinjection. You can use this option only when the above option is active.
- 3. Just before the OS adjustment, you can additionally:
 - View all found hardware devices and their driver status by clicking ⁽²⁾. The wizard names all devices according to their model description, not some alphanumeric code, which is very convenient. So you can compare the listed devices with the given hardware to make sure the wizard has analyzed your system correctly.

• Filter devices without drivers by clicking [•] . Unlike the automatic mode, where only boot critical devices (storage controllers) without drivers are being reported, here you can view and inject drivers for network cards as well.

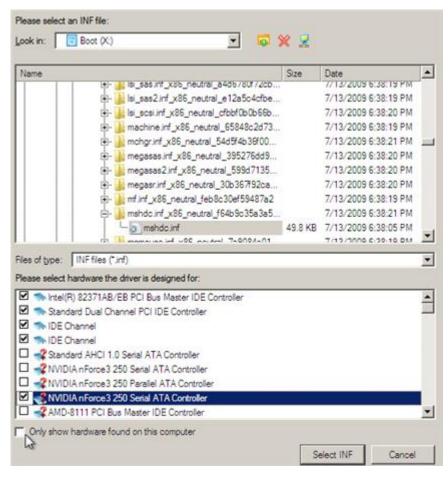

• Add a driver for each device that lacks it by clicking on the device, then browsing for the required location. The wizard will then match the device with drivers inside the given location and pick the right one.

• Manually add a driver for a device that has not been found by our wizard by clicking ** , then specifying the required .INF file.

When selecting an .INF file that contains several driver records for hardware you both, have in the system and don't have, you can filter the list by marking the appropriate checkbox.

• Remove a driver for a device, which has not been found in the system.

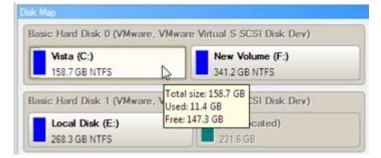

Hard Disk Optimization

To defragment an NTFS or FAT partition, please do the following:

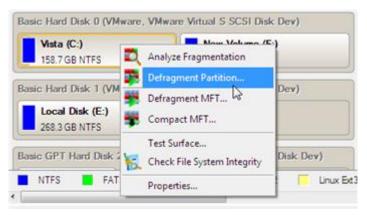

You must have administrator's privileges to accomplish defragmentation of the system partition.

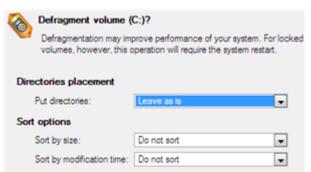

- 1. Click the **<Security and Optimization>** button and then select **Defragment Partition**.
- 2. In the main window, select a partition you want to defragment on the Disk Map.

3. Launch the Defragment Partition dialog by calling the popup menu for the selected partition (right click of the mouse button) and then selecting the menu item: **Defragment Partition**...

4. In the opened dialog define settings of the operation. To improve the performance we recommend you to mark the **Do not save content of the Pagefile.sys or (and) Hiberfile.sys** checkbox as these files are only needed for the current Windows session.

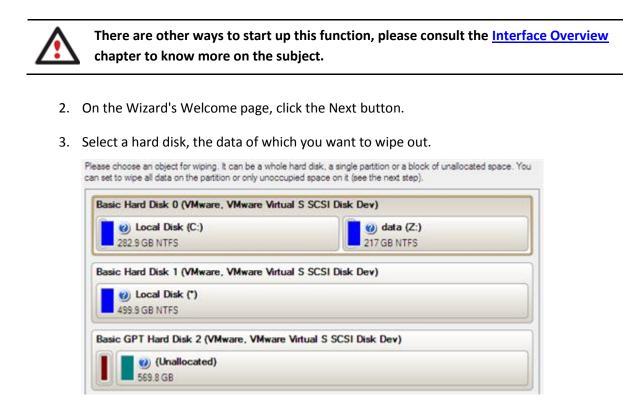

The Defragment Partition dialog offers a number of additional parameters that can also be of help. However here we pay attention to the most relevant to fulfill our task.

5. Start the operation by clicking the Yes button.

Hard Disk Utilization

To irreversibly destroy all on-disk information without any possibility to recover and that way providing the maximum level of security, please do the following:

1. In the Main Menu: select Wizards > Wipe Hard Disk or Partition...

4. On the Wipe Mode page, select the wipe out all the data to irreversible destroy all on-disk information.

5. On the Wipe Method page select a specific data erasure algorithm or choose to create a customized one (in our case we prefer to use a certified military standard).

The list of supported military and government standards may vary for your product.

6. The next page of the wizard enables to get detailed information on the selected algorithm, choose whether to carry out residual data verification or not specifying the percentage of sectors to check and estimate the time required to accomplish the operation.

Wipe method
US DoD 5220.22-M
Overwrite all addressable locations with a character, its complement, then a random character and verify.
Erase passes count: 3
Verfy passes count: 1
Verify wipe results Percentage of sectors to check: 100
Approximate wipe time: 14:02:40
You can skip verifying completely or partly by disabling it or reducing percentage of sectors to check. Please note, it would be a deviation from US DoD 5220.22-M.

7. Review all parameters of the operation and modify them if necessary.

our hard disk before the changes:	am Virtual S SCSI Diek Dev.)
Local Disk (C:) 282.9 GB NTFS	data (Z:) 217 GB NTFS
our hard disk after the changes:	
Basic Hard Disk 0 (VMware, VMw	are Virtual S SCSI Disk Dev)
(Unallocated) 499.9 GB	

8. Complete the wizard and then apply the pending changes.

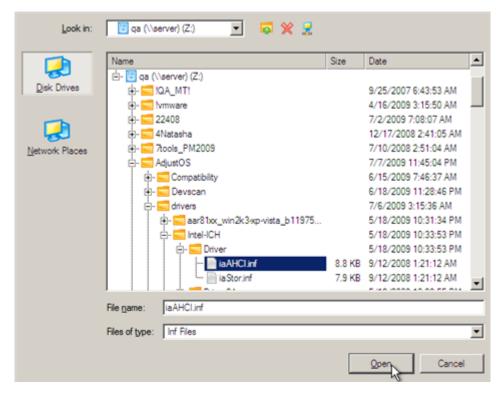

Extra Scenarios for WinPE

Adding specific drivers

Our WinPE 3.0 based recovery environment offers excellent hardware support. Anyway you've got the option to add drivers for specific hardware with a handy dialog.

To add drivers for specific hardware, please do the following:

- 1. Once you accept the agreement, you will see the Universal Application Launcher. Click Load Drivers.
- 2. In the opened dialog browse for an .INF file of the required driver package located on a floppy disk, local disk, CD/DVD or a network share. Then click the **Open** button to initiate the operation

To know how to map a network share, please consult the **<u>Configuring network</u>** scenario.

3. You will be notified on the successful accomplishment of the operation. Click **Yes** to load another driver or **No** to close the dialog.

Our WinPE 3.0 recovery environment is 32-based, thus you need to use 32-bit drivers for injection.

Configuring network

If your local network has a DHCP server, a network connection will be automatically configured once our WinPE recovery environment has been started up. Otherwise you will need to do it manually with a handy dialog by providing an IP address, a network mask, default gateway, etc. Besides with its help you can easily map network shares.

To manually set up a network connection and map a network share, please do the following:

- 1. Once you accept the agreement, you will see the Universal Application Launcher. Click **Configure Network**.
- 2. In the opened dialog provide an IP address, a network mask, default gateway, etc. for your network device.

Network adapters Network drive	s <u>Network identfi</u>	cation	
Ethemet adapter: Intel(R) PRO/1000 MT Network Connection			
IP address DNS / Wins			
C Obtain an IP address automaticaly.		Regew	<u>R</u> elease
Use the following IP address :			
IP Address : 200.0 .1 .20	98		
Subnet Mask : 255.255.240	.0		
Default Gateway : 200.0 .1 .1			A <u>d</u> vanced
Load from file Save to file	QK	Apply	Cancel

3. Click the Network drivers tab to map a network share.

٦	Network	adapters Network drives Network iden	tfication	
	Drive	Network path		Map Network Drive
	Z:	\\server\qa		Disconnect Drive

4. Click **Map Network Drive** and provide all the necessary information to map a network share in the opened dialog:

Remote location mapping A network share : []		
Map to drive letter : Y: Make permanent connection		
(😻) Connect as user	<u>0</u> K	<u>C</u> ancel

- Click the standard browse button [...] to browse for the required network share or manually enter a path to it;
- Define a letter from the pull-down list of available drive letters;
- Click the **Connect as user** button at the foot of the dialog page to specify a user name and password to access the selected network share if necessary.

By clicking **Disconnect Drive...** you can delete an existing network share if necessary.

5. Click the **Network identification** tab to change a network name of your computer (generated automatically) and a workgroup name.

Network adapters	Network drives Network identification
Computer Name :	MININT-96SDQ6E
Workgroup :	WORKGROUP
Primary DNS suffix :	

6. By default, the wizard saves all network settings in the netconf.ini file located on the WinPE RAM drive, thus it will only be available until you restart the computer. However, you can just once configure your network device and then save this file to some other destination, for instance a local drive, and this way avoid constant re-

configuration, just by providing a path to it. So Click **Save to file** to save the netconfig.ini file to the required destination.

Saving log files

The program enables to simplify the procedure of sending support requests to the Paragon Support Team. In case of having difficulties with handling the program, you, with the help of this very function, can address the company support engineers and provide them with all the information they need such as the disk layout, performed operations, etc. in order to tackle the encountered problem. Information of that kind is stored in log files.

To prepare a log files package, please do the following:

- 1. Once you accept the agreement, you will see the Universal Application Launcher. Click Log Saver.
- 2. In the opened dialog browse for the required location of the log files package or manually provide a full path to it. Click **Collect** to initiate the operation.

	Browse
Collect	Exit
	Colleg

Log files do not contain any confidential information on the operating system settings or the user documents.

Troubleshooter

Here you can find answers to the most frequently asked questions that might arise while using the program.

1. I try to run an operation, but the program claims my partition is in use and suggests restarting the computer.

There are a number of operations that cannot be performed while your partition is in use (or locked in other words). Please agree to reboot your machine to make the program accomplish the operation in a special bootup mode.

2. I run an operation and restart the machine as required, but it just boots back into Windows without accomplishing the operation.

Please run 'chkdsk /f' for the partition in question.

3. I cannot create a new partition on the disk.

There can be a number of reasons for that:

- The program cannot create a new partition on a dynamic disk.
- The program allows creating new partitions only within blocks of un-partitioned space. It cannot convert a free space on an existing partition to a new partition.
- 4. I cannot copy a partition.

There can be a number of reasons for that:

- The source or target disk you select is a dynamic disk;
- 4 primary partitions (or three primary partitions and an extended one) already exist on the target disk.

5. I need to copy a partition. But when selecting a place where to make a copy, I always get a crossed circle sign no matter which partition is selected.

The program enables to copy a partition only to a block of un-partitioned space. If you don't have a block of free space on your hard disk, please delete or reduce an existing partition to accomplish the operation.

6. I cannot do anything with my USB flash drive. I get a crossed circle sign when trying to select any area on it.

Some USB flash drives don't have the MBR (Master Boot Record), that's the cause of your problem. To fix the issue please use the Update MBR function of our program or 'fixmbr' of the Windows installation disc to write a standard code to your flash drive.

7. When trying to back up my system the program asks to restart the computer.

Most likely the Hot Processing mode is disabled. Please make it active in the program settings.

8. When backing up a partition with the VSS (Volume Shadow Copy Service) mode, the program throws "VSS could not be started for processed volume".

Most likely you try to back up a FAT32 partition, which is not supported by VSS. Please use the Paragon Hot Processing mode instead.

9. I cannot back up my hard disk to an external hard drive. Once started, the operation is aborted with the following error: Hard Disk management, Error Code 0x1100a. What is wrong here?

The problem is that the Microsoft VSS service is set as the default Hot Processing mode in the program. But this service has not been started in your WindowsXP/Windows2003/Vista. Please start this service (right click on My Computer > Manage > Services > find Microsoft Volume Shadow Copy Service and make it active. Set also to start it automatically).

10. When running a backup operation with the Paragon Hot Processing mode enabled, I get an error: error code 0x1200e "Internal error during Hot Backup"

Most likely your hard disk contains bad blocks. Please fix the issue with your HDD manufacturer's tool.

You can find a name of the tool you need here: http://kb.paragon-software.com

 When running a backup operation with the Microsoft VSS mode enabled, I get the following error: error code 0x12016 "VSS: can't read volume data"

Most likely your hard disk contains bad blocks. Please fix the issue with your HDD manufacturer's tool.

You can find a name of the tool you need here: http://kb.paragon-software.com

- 12. When trying to back up to a network share, I get the following error: "i/o error" or "can't open/create file" Please check whether you've got a permission to write to the selected destination or not.
- 13. When trying to restore a backup archive, I get the following error: "Can't restore to current selection" or "Archive does not fit"

Most likely you're trying to restore a backup of the whole hard disk to a partition or vice versa.

14. I set up a timetable for a task, but it fails to execute.

There can be a number of reasons for that:

- Windows Task Scheduler does not work properly. Check whether it is so or not by scheduling a simple task (call Notepad through scheduling);

- You don't have permission to write to the selected backup destination.

Glossary

Active Partition is a partition from which an x86-based computer starts up. The active partition must be a primary partition on a basic disk. If you use Windows exclusively, the active partition can be the same as the system volume.

In the DOS partitioning scheme, only primary partitions can be active due to limitations of the standard bootstrap.

The term **backup** originates from the time when the best way to protect valuable information was to store it in form of archives on external media. It's become now a general notion to mean making duplications of data for protection purposes.

Bootable Archive is created by adding a special bootable section when backing up the data to CD/DVDs. Thus you will be able to restore the data from these archives without having to run the program, but by simply booting from these CD/DVDs.

Cluster is the smallest amount of disk space that can be allocated to hold a file. All file systems used by Windows organize hard disks based on clusters, which consist of one or more contiguous sectors. The smaller the cluster size, the more efficiently a disk stores information. If no cluster size is specified during formatting, Windows picks defaults based on the size of the volume. These defaults are selected to reduce the amount of space that is lost and the amount of fragmentation on the volume. A cluster is also called an allocation unit.

Extended Partition is a partition type you create only on a basic MBR (Master Boot Record) disk. Extended partition is used if you want to create more than four volumes on a disk, since it may contain multiple logical drives.

File System Metadata. The servicing structures of a file system, which contain information about allocating files and directories, security information etc, are named the file system metadata. It is invisible for users and regular applications because its accidental modification usually makes a partition unusable.

Hard Disk Geometry. Traditionally, the usable space of a hard disk is logically divided into cylinders, cylinders are divided into tracks (or heads), and tracks are divided into sectors.

The triad of values {[Sectors-per-Track], [Tracks-per-Cylinder], [Amount-of-Cylinders]} is usually named the Hard Disk Geometry or C/H/S geometry.

Tracks and cylinders are enumerated from "0", while sectors are enumerated from "1". These disk parameters play an essential role in the DOS Partitioning scheme.

Modern hardware uses an advanced scheme for the linear addressing of sectors, which assumes that all on-disk sectors are continuously enumerated from "0". To allow backward compatibility with older standards, modern hard disks can additionally emulate the C/H/S geometry.

Hidden Partition. The concept of a "hidden" partition was introduced in the IBM OS/2 Boot Manager. By default, an operating system does not mount a hidden partition, thus preventing access to its contents.

A method of hiding a partition consists in changing the partition ID value saved in the Partition Table. This is achieved by XOR-ing the partition ID with a 0x10 hexadecimal value.

Master File Table (MFT) is a relational database that consists of rows of file records and columns of file attributes. It contains at least one entry for every file on an NTFS volume, including the MFT itself. MFT is similar to a FAT table in a FAT file system.

MBR & 1st track of the hard disk is the 0th sector of the disk. MBR (Master Boot Record) contains important information about the disk layout:

- The used partitioning scheme;

- The starting records of the Partition Table;
- The standard bootstrap code (or the initial code of boot managers, disk overlay software or boot viruses).

Generally, the 0th sector is used for similar purposes in all existing partitioning schemes.

The MBR capacity is not sufficient to contain sophisticated boot programs. That's why the on-boot software is allowed to use the entire 0th track of the disk. For example, boot managing utilities such as LILO, GRUB and Paragon Boot Manager are located in the 0th track.

Partition ID (or File system ID) is a file system identifier that is placed in the partition. It is used to quickly detect partitions of supported types. A number of operating systems completely rely on it to distinguish supported partitions.

Partition ID is saved in appropriate entries of the Partition Table and takes only 1 byte of space.

Partition Label (or Volume Label) is a small textual field (up to 11 characters) that is located in the partition's boot sector. This value is used for notification purposes only. It is detectable by any partitioning tool including the DOS FDISK utility.

Modern operating systems save it within a file system, e.g. as a special hidden file. Thus it is able to contain a relatively large amount of text in multiple languages.

Partitioning Scheme is a set of rules, constraints and format of the on-disk structures to keep information on partitions located on a hard disk.

There are known several partitioning schemes. The most popular of them is the so-called DOS partitioning scheme. It was introduced by IBM and Microsoft to use multiple partitions in the disk subsystems on IBM PC compatible computers.

Another popular partitioning scheme is the so-called Logical Disks Model (LDM) that originates from the UNIX mainframe systems. Veritas Executive accommodates a simplified version of LDM to the Windows 2000 operating system.

Windows 2000 and XP support two quite different partitioning schemes: the old DOS partitioning scheme and the new Dynamic Disk Management (DDM). The problem is that earlier versions of Windows do not support DDM. In addition, most hard disk utilities do not support it as well.

Recovery Media is a CD/DVD disc, a USB flash card or even a floppy disk from which you can boot for maintenance or recovery purposes.

Root Directory is the top-level directory of a formatted logical drive to include other files and directories. In modern file systems (Ext2/Ext3, NTFS and even FAT32) it does not differ from other directories. This is not the case for old FAT12 and FAT16 file systems.

Serial Number. In the DOS partitioning scheme, every hard disk and every partition has a 32-bit serial number represented by an 8-figure hexadecimal value. It is stored in the MBR and its value is assigned when the MBR sector is initialized by Microsoft standard disk managing tools, such as Windows Disk Administrator and the FDISK utility.

In fact, a hard disk's serial number is not important for most operating systems and software. It is known that Windows NT, 2000 and XP store its value in the database of assigned drive letters.

A partition's serial number is stored in its boot sector (in FAT16, FAT32 and NFTS file systems). Its value is assigned when the partition is formatted. It does not play an important role for most operating systems and software as well.
